STRATEGICA

Challenging the Status Quo in Management and Economics

CONFERENCE HONORARY CHAIR

Remus Pricopie, Rector, National University of Political Studies and Public Administration (SNSPA), Romania

CO-CHAIRS

Constantin Brătianu – Professor, Bucharest University of Economic Studies, Romania

Florina Pînzaru – Dean, Faculty of Management, SNSPA, Romania

TRACK CHAIRS

Andreia Gabriela Andrei, Alexandru Ioan Cuza University of Iași, Romania

Lucian Claudiu Anghel, SNSPA, Romania

Constantin Brătianu, Bucharest University of Economic Studies, Romania

Alina Mihaela Dima, Bucharest University of Economic Studies, Romania

Gandolfo Dominici, Polytechnic School of the University of Palermo, Italy

Patrizia Gazzola, University of Insubria, Italy

Mariana Nicolae, Bucharest University of Economic Studies, Romania

Luminița Nicolescu, Bucharest University of Economic Studies, Romania

Cristian Păun, Bucharest University of Economic Studies, Romania

Mauro Romanelli, Parthenope University of Naples, Italy

Tănase Stamule, Bucharest University of Economic Studies, Romania

Lajos Szabo, Corvinus University of Budapest, Hungary

Laurențiu-Mihai Treapăt, SNSPA, Romania

Elena-Mădălina Vătămănescu, SNSPA, Romania

Ralf Wagner, University of Kassel, Germany

Alexandra Zbucnea, SNSPA, Romania

SCIENTIFIC COMMITTEE

Laurențiu Anghel, Bucharest University of Economic Studies, Romania

Nedra Bahri-Ammari, IHEC of Cartage, Tunisia

Dumitru Borțun, SNSPA, Romania

Nicholas Chandler, Budapest Business School, Hungary

Camelia Crișan, SNSPA, Romania

Nicolae Dănilă, Bucharest University of Economic Studies, Romania

Daniel Glaser-Segula, Texas A&M University San Antonio, Texas, US

Bogdan Glăvan, Romanian-American University, Romania

Joanna Jończyk, Bialystok University of Technology, Poland

Omkumar Krishnan, Chonnam National University, India

Raquel Meneses, University of Porto, Portugal

Mariana Nicolae, Bucharest University of Economic Studies, Romania

Luminița Nicolescu, Bucharest University of Economic Studies, Romania

Dimitrios Nikolaidis, City College International Faculty of Sheffield University, Greece

Marina Ochkovskaya, Lomonosov Moscow State University, Russia

Cristian Păun, Bucharest University of Economic Studies, Romania

René Schmidpeter, Cologne Business School, Germany

Lajos Szabó, Corvinus University of Budapest, Hungary

Eduardo Tome, Universidade Europeia, Portugal

Katarzyna Wasowska, Siedlce University of Natural Sciences and Humanities, Poland

Wioletta Sylwia Wereda, Institute of Organization and Management, Military University of Technology in Warsaw, Poland

ORGANIZING COMMITTEE

Alexandra Zbucnea, SNSPA, Romania
Elena-Mădălina Vătămănescu, SNSPA, Romania
Lucian Claudiu Anghel, SNSPA, Romania
Andreea Mitan, SNSPA, Romania
Georgiana Cristea, SNSPA, Romania
Alexandra Vițelar, SNSPA, Romania
Irina Isvoranu, SNSPA, Romania
Lucian Simion, SNSPA, Romania

Foreword

STRATEGICA is not a conference. It is a challenge! It is a challenge for all its stakeholders, founders, partners, participants and sponsors, for trying to search for the future and to identify those problems for which our community members can imagine solutions. And, as Tom Peters once emphasized, when we face crazy times we have to search for crazy solutions!

STRATEGICA has been initiated by the Faculty of Management, National University of Political Studies and Public Administration, Bucharest, Romania in partnership with the National Bank of Romania, in 2013, as an international forum for academics, researchers and practitioners in Economics, Finance, Business, Management, and Marketing for sharing their experience and expertise, new ideas and models, new concerns about our future and possible solutions. This year, STRATEGICA is organized in partnership also with SAMRO – Romanian Academic Society of Management, and IAKM – International Association for Knowledge Management. STRATEGICA community has been growing steadily, year by year, from 70 participants coming from 12 countries in 2013 up to over 140 participants coming from 31 countries and 4 continents in 2018. The amplifying process of knowledge dissemination done by Research Gate is also worthy of mentioning since each volume of STRATEGICA Proceedings has been downloaded more than 300 times. All the previous proceedings are indexed in Conference Proceedings Citation Index (Clarivate Analytics, former Thomson Reuters/ISI Proceedings).

STRATEGICA is honored each year by great Keynote speakers. For this year we are proud to have as Keynote speakers: Rachel Lomax – former Vice-president of the Bank of England, Ovidiu Nicolescu – Professor Emeritus of Management, Bucharest Academy of Economic Studies, and President of SAMRO, Aino Kianto – Professor of Knowledge Management and Director of Graduate Programs at the Business Schools, Lappeenranta University of Technology, Finland, Juan Gabriel Cegarra-Navarro – Professor of Strategic Management and Knowledge Management at Universidad Politecnica de Cartagena, Spain, and Ian Hipkin – Professor of Strategic Management at the Business School of Exeter University, and Ecole Supérieure de Commerce, Pau, France.

The conference is structured this year on the following topical sections:

Economics – Chair: Cristian Paun – Professor and the Vice-Dean of the Faculty of International Economic Relations, Bucharest University of Economic Studies, Bucharest, Romania.

Finance and Banking – Chairs: Lucian Anghel – Chief Executive Officer of BCR Banca de Locuințe and Chairman of Bucharest Stock Exchange, and Professor at the Faculty of Management, National University of Political Studies and Public Administration, Bucharest, Romania, and Laurențiu Treapăt – former manager of BCR, professor at the National University of Political Studies and Public Administration, Bucharest, Romania. Management and Leadership – Chair: Mariana Nicolae – Professor Emeritus, Bucharest University of Economic Studies, Bucharest, Romania.

Knowledge Economy – Chairs: Constantin Brătianu – Professor Emeritus, Bucharest University of Economic Studies and at the National University of Political Studies and Public Administration, Bucharest, Romania, and Alexandra Zbucnea – Professor and Vice-Dean of the Faculty of Management, National University of Political Studies and Public Administration, Bucharest, Romania.

Marketing and Consumer Behavior – Chairs: Ralf Wagner – Professor at the Kassel University, Germany, and Luminița Nicolescu – Professor, Bucharest University of Economic Studies, Bucharest, Romania.

Digital Systems, E-Marketing and Organizational Dynamics – Chairs: Gandolfo Dominici – Professor and Director of SEAS Department, University of Palermo, Italy, Vice-President of International Association of Business Systems Laboratory (BS-Lab), and Editor in Chief of: *Kybernetes*, *International Journal of Markets and Business Systems*, and *International Journal of Electronic Marketing and Retailing*, and Elena-Mădălina Vătămănescu – Professor at Faculty of Management, National University of Political Studies and Public Administration, Bucharest, Romania.

Business Ethics and CSR – Chairs: Patrizia Gazzola – Professor at Insubria University, Italy, and Andreia Gabriela Andrei – Professor at the “Alexandru Ioan Cuza” University of Iasi, Romania.

Challenges in Project Management – Chair: Lajos Szabo – Professor at the “Corvinus” University of Budapest, Hungary, and founder of the Hungarian Association of Project Management.

Towards Sustainable Public Organizations – Chair: Mauro Romanelli – Professor at the Parthenope University of Naples, Italy.

Sustaining Leadership for Innovative Business – Alina Mihaela Dima – Professor and Director of the UNESCO Department for Business Administration, Bucharest University of Economic Studies, Bucharest, Romania, and Tanase Stamule – Professor and Vice-Dean of the Faculty of Business Administration, Bucharest University of Economic Studies, Bucharest, Romania, and Program developer of the Konrad Adenauer Foundation.

Abstract. *The objective of this article is to identify distinctive features of small-sized entrepreneurship development in the Russian Federation, and to develop key vectors of the small businesses development. While developing small-sized entrepreneurship development vectors, peculiarities of the small business sector development in the country are not taken into account. It is necessary to identify external threats and internal factors, affecting small business development. As a result of the study of small business development features in the country, practical recommendations on the small-sized entrepreneurship development vectors have been suggested. Practical recommendations on the small-sized entrepreneurship development have been issued. The use of the recommendations developed on the small-sized entrepreneurship development will make it possible to eliminate the management process imbalances and to identify priority development vectors, thus contributing to the increased production of goods, enlargement of the range of services, creation of new jobs, and unemployment reduction. Distinctive features of the small-sized entrepreneurship development in the Russian Federation have been defined, allowing us to identify external threats and internal small business development factors, and to suggest priority development vectors for further.*

Keywords: *Small business; development; socio-economic system; development vectors; efficiency; economic sector.*

Introduction

Small business plays an important role in the economy, also being an inseparable element of the social and economic system of the state. The development of the entrepreneurship assists in creating favorable market conditions by involving a huge number of the state citizens in a system of interrelationships on own business startups, which in future will bring a high production efficiency through a narrow specialization and integration of production operations.

In the developed countries, e.g., in the United States, the small-sized entrepreneurship is responsible for about 40% of the gross product, ensuring the employment for almost half of the able-bodied population; also, it implements twice as many innovations as large firms. In Germany, Canada and Great Britain, the share of the small-sized entrepreneurship in production is 60-70% (Terebova, 2015).

Small enterprises create a comfortable climate for the economy rehabilitation: competitive environment ontogenesis takes place; market is saturated with goods and services; additional jobs are created in organizations; consumer sector becomes ever richer; local feedstock, financial and other resources as well as innovative and human potential are better used.

Small-sized entrepreneurship undertakes such a social function as the ability to absorb free labor force in large amounts, and to reduce social tension and unemployment.

Distinctive features of the small-sized entrepreneurship development in the Russian Federation

In Russia, small business as a sector of the economy emerged about 25 years ago and now is being strengthening in the market. Small businesses are more preferable for the economy of the state due to the following reasons:

- Market, comprising a lot of enterprises, creates conditions for a competitive system development, which, in its turn, allows price reduction, and on the contrary, one large company, operating in the marketplace, prepares conditions for becoming a monopoly;
- Decentralization of the economic power generates a different range of goods and, therefore, a larger choice for customers, thus increasing customer satisfaction.

Each small business is an undertaking with its unique history and mode of operation, which forms preconditions for maintaining various applications and traditions. In Italy, 94.8% of companies employs fewer than 9 workers, which is 46% of the total number of active population. In Spain, 94.1% of companies also employs fewer than 9 workers, and this represents 38.5% of the total number of active population. Compare these data with those for the United Kingdom, for example, where 46.4% of the total number of active population works in companies with more than 250 workers, and only 18.6% of employees work in small enterprises. Thus, each history and community creates its own economic systemy.

In Russia, the situation is slightly different, because Russia's history and economic system differs from the European one. In Russia, small business develops unevenly due to geographic factors. In 2014, the Moscow regions accounted for 241,300 small enterprises (in 2010, this figure was lower by about 40,000 pcs); at the same time, all

Urals regions accounted for only 183,500 organizations in the same year (Federal State Statistics Service, 2013). First and foremost, it depends on the number of population that resides in the region, and its geographical location (availability of natural resources). The dependence of any region on raw material export tends to slow down the national economy development process.

According to statistical data, 54.8% of jobs in Russia are created by large enterprises. For comparison, in European countries, large enterprises are responsible for the employment of only 34.2% of the able-bodied population. A share of medium-sized enterprises in total employment in Russia is 23.4%. And only 11% and 10% of jobs are provided by small enterprises and individual entrepreneurship, respectively. (Golubkov, 2013)

When the distribution of subjects of small and average business in the Russian regions as of 2017, you can see that the share of enterprises accounted for three of the County: 28.2% of the enterprises in the Central Federal district, 21, 8% on Privalsky Federal district and 12.9% in the Siberian Federal district (Federal State Statistics Service, 2017).

The structure of economic activities of small and medium-sized businesses by the average number of employees is as follows:

- 25.2% is wholesale and retail trade, repair of motor vehicles of other household products;
- 20.9% is accounted for operations with real estate, lease and provision of services;
- 17.7% are in manufacturing;
- 12.1% is for strotelstvo;
- 34.1 per cent are transport and communications, mining, agriculture and other economic activities.

The bulk of the revenue of small and medium-sized enterprises 54.4% accounted for wholesale and retail trade (Federal State Statistics Service, 2017).

The share of small and medium-sized businesses in Russia's GDP is about 20% , in 2017 there is a significant increase of 1.7% (Federal State Statistics Service. 2017), which is a positive trend, while according to the strategy of small business development, their share should grow to 40%. In addition, small and medium-sized businesses have significant competitive advantages over large businesses. The sector under consideration is able to quickly meet small volumes and non-standard needs of the environment. For example, enterprises personally interact with the buyer in accordance with the peculiarities of the technological process. Increased competition is generated by copying and developing a small-scale and specialized market that is inaccessible to large-scale production. The generation of innovation activity is achieved through the rapid introduction of innovation in production and management.

Small business development is particularly affected by a legal framework established in the region concerned. High dependence from market fluctuations, requiring a multifaceted state support for volatility mitigation, is a specific feature of the small business development in Russia. For a given time interval, small business acquired certain stability of development and sufficient breadth of distribution, having turned

into an independent sector of the state economy with clearly visible features (Usmanov, 2016) (Table 1).

Table 1. Russian small business features

Russia	Developed countries
Integration of several business vectors and activities in one small enterprise	Narrow specialization of small enterprises
Human potential integration at a low level of furnishing of many small enterprises with high-tech equipment	Integration of a low level of employees' innovative potential at a high level of furnishing of many small enterprises with high-tech equipment
Availability of a high level of general and professional education and qualification of managers of small enterprises, combined with a shortage or lack of experience in making managerial decisions on commercial activities at volatile market conditions	High level of managerial and commercial experience, almost complete absence of a shortage or lack of experience in making managerial decisions on commercial activities at volatile market conditions
High level of small enterprise adaptation to a rapidly changing market environment at a disorganized state control system, which results in the shortage of timely, comprehensive and reliable information on the market state, trends and conditions	Stable economic environment, availability of updated, exhaustive and reliable information on the market state and trends
Virtually complete unavailability of integration and interactions with large, medium and other small enterprises.	Availability of integration and interactions with large businesses, medium and other small enterprises.

These Russian small business features predefined an individual path of development, different from the way generally accepted in a classical market economy.

On May 12, 1995, the Russian State Duma adopted the first law "On the State Support of Small Entrepreneurship in the Russian Federation". In 2007, the Federal Law "On the Development of Small and Medium-Sized Entrepreneurship in the Russian Federation" was adopted. This law expressly defines the size and revenue of enterprise, etc. Small businesses need to pass various inspections and submit business activity reports to many authorities. These manipulations severely hamper the development of the enterprise.

External threats and internal factors, affecting the small-sized entrepreneurship development

In its turn, the state is trying to help small businesses through a continuous development of special programs to support small businesses (e.g., a simplified taxation and accounting system).

The most severe external threats to the small business development are as follows (Small business and support of individual entrepreneurial initiatives" project, 2017):

- High tax rates;
- Low staff availability;
- Crisis, volatile market conditions;
- High competition;
- Administrative barriers, corruption;

- Poor infrastructure development;
- Inaccessibility of loans and other financial facilities;
- Low accessibility of premises.

Also, there is a number of internal factors, threatening successful implementation of entrepreneurial projects, i.e. (Terebova, 2015):

- Ineffective distribution of financial resources;
- Entrepreneurs do not have sufficient experience in management;
- Lack of a marketing development strategy and an action item plan for future enterprise development.

To increase the efficiency of economic development of the region, certain measures shall be implemented by municipal authorities. Local authorities have acquired exhaustive and reliable information about resources, production and economic potential of organizations on the controlled territory. In many regions, large industrial enterprises play a major role in the economy, and local authorities need to establish a procedure for interaction between such enterprises and small business organizations for a long-term period, since this will result in a higher economic effect.

For the time being, the small business development in Russia is still fledgling, considering existing system of legal and organizational support of small business organizations as a separate sector of the country's economy. Neither effective operation of the existing small business motivation system is mastered, nor procedures and mechanisms for supporting these enterprises are in place. The below mentioned model for small business development in Russia is suggested (see Fig. 1).

Figure1. Small business development vectors

At present, the state program fails to formulate clear action mechanisms and procedures in the monetary and tax policy, inventory and technical support, and system of official guarantees. Strict adherence to these mechanisms would ensure equal start-up conditions for entrepreneurship activity development in the small business.

Conclusion

An action plan for market infrastructure institutions, commodity market and securities market, investment and venture entrepreneurship as well as for information, consulting and audit activities shall be developed. It is advisable to integrate various state and public small business support systems, and the integrated system shall include advanced staff training and retraining.

A list of activities to support foreign economic activity and attract foreign investments for small businesses development shall be compiled. To implement these programs, not only the state budget funds, but also the inflow of private domestic and foreign capital are required. The state resources should be focused on insurance and granting loan guarantees.

Financial, credit and investment assistance to the small business shall combine optimization of tax benefits, the development of a lending system and the organization of comfortable investment conditions, with the involvement of specialized funds and other financial institutions. Combining direct and indirect assistance to small businesses should form a required start-up capital for new organizations, develop already functioning small undertakings, and overcome entrepreneurs' desire to evade taxation. Tax privileges for small business enterprises, established under applicable laws, should be kept. Also, it's important to optimize the accounting and reporting system for small business organizations with the aim to obtain basic information required for resolving taxation issues.

At this small business development stage, it's critical to develop a new model for Russian small-scaled entrepreneurship development as well as procedures for providing effective functioning of the state small business support systems. Placing the emphasis on a stable operation of small, medium and large business associations is of top priority.

Abstract. *Transport infrastructure plays a key role in the development of the economy of any country. The transport infrastructure development directly affects the country (or region) economy competitiveness, as well as affects the GDP growth and country export potential. The aim of this study is to develop a methodology for assessing the transport infrastructure development (for example, the Russian Federation) on the basis of the business community estimates and Rosstat data using quantitative and statistical methods of evaluation and using statistical data for 10 years. In this study, the following methods were used: a) questionnaires of entrepreneurs, business leaders, b) modal estimation; C) median estimation; d) comparison method; d) expert assessments method. The study revealed the level of the transport infrastructure development of the Russian Federation on the statistical data basis, as well as the business community satisfaction degree with the transport infrastructure conditions. The study results can be used to develop plans and strategies for the targets selection for the transport infrastructure development.*

Keywords: *transport infrastructure; assessment; estimation; entrepreneurship; development.*

Introduction

The condition of transport infrastructure significantly affects the development of the economy and society. The analysis carried out using statistical methods showed a significant correlation between the level of the transport infrastructure development and GDP per capita – the most representative indicator of socio-economic development.

This relationship is clear from the point of view of economic logic. The "motor" of economic growth is the entrepreneurial activity. The transport opens and helps to realize business opportunities by entering new markets or access to cheaper and quality resources. This finally contributes to economic growth and human well-being.

The issues of the transport infrastructure development are considered in various aspects in the works of both domestic and foreign scientists. Among the researchers who have made a substantial contribution to the theory and methodology development of economic evaluation and management of transport infrastructure, we can highlight the work of scientists such as Macheret, Ryshkov, Beloglazov and Zakharov (2010), Kirzner (2010), Lapidus (2008), Sokolov (2017), Lyovin (2016), Macheret (2016), Mogilevkin (2010), Sotnikov (2005), Walters (2004), Fogel (1964), Grant-Muller et al. (2001), Quinet (1998).

The aim of this study is to develop a methodology for assessing the transport infrastructure development (for example, in Russia) on the basis of the business community estimates and Rosstat data using quantitative and statistical methods of evaluation and statistical data for 10 years.

Methodology

Taking into account the close relationship between transport and entrepreneurship, the survey assessed the of transport infrastructure development by the business community representatives. The Russian business climate survey conducted by the Russian Union of Industrialists and entrepreneurs covers transport infrastructure assessments by the members of all economic sectors, which makes their results quite representative (Russian Union of Industrialists and entrepreneurs, 2016, p.34). In order to confirm the objectivity of the transport infrastructure assessment, the business community members analyzed official data of Rosstat (Rosstat, 2016, p.18). They make it possible to compare the dynamics of the railway and highway road infrastructure development, as well as to confirm the objectivity of the entrepreneurial assessment of transport infrastructure.

The assessment of the transport infrastructure development was carried out using quantitative methods and was performed in several stages:

1. Assessment of the transport infrastructure situation by the business community representatives on a 7-bit scale as of 2007, 2011 and 2016 years.
2. Grouping of the received estimates within a 5-point scale, with the allocation of unsatisfactory (1-2 points) and satisfactory (3-5 points) estimates.
3. Modal assessment of transport infrastructure condition.
4. Median assessment of transport infrastructure condition.
5. Assessment of the dynamics of the railways and highways development according to the official data of Rosstat.
6. Comparison of the evaluation results of railways and highways development according to the official Rosstat data and to the business community data.

Results

Taking into account the close relationship between transport and entrepreneurship, the business community members are interested in assessing the transport infrastructure

development. The Russian business climate survey conducted by the Russian Union of Industrialists and entrepreneurs covers the transport infrastructure assessments by the members of all sectors of the economy, which makes their results quite representative (Russian Union of Industrialists and entrepreneurs, 2016, p.34).

Representatives of the business community assessed the transport infrastructure condition on a 7-bit scale. Such a high level of detail makes less obvious the comparison of estimates in dynamics. Therefore, when carrying out the analysis, the extreme estimates of transport infrastructure condition (on the one hand "very bad" and "bad", on the other hand - "good" and "very good") were combined. The results of these estimates analysis are shown in table 1. This made it possible to reduce the scale of estimates to 5-bit, which made it possible to interpret it within the usual 5-point scale, with the allocation of unsatisfactory (1-2 points) and satisfactory (3-5 points) estimates.

In addition, modal and median estimates of the transport infrastructure condition are revealed. Modal estimates are those that occur most frequently. For example, in 2016 the average estimate (25.6%) was the most common among highway condition estimates, while the average estimate for railways was "rather good" (28.5%). However, the modal estimate, being relatively more frequent, is not predominant. Moreover, the frequencies of different estimates can be very close. For example, in 2016 the evaluation of highways condition as "rather bad" was characterized by a frequency, which is slightly different from the frequency of the modal evaluation (25%). Therefore, the modal rating was complemented by the median estimates. The median estimate is located in the middle of the cumulative distribution of estimates, that is, it characterizes the "central trend" of estimates.

Proportion determination of satisfactory and unsatisfactory ratings, weighted average score, as well as modal and median estimates, makes it possible to characterize the transport infrastructure quality from the point of view of the business community in comparison by mode of transport and in dynamics.

Both on average, and on a ratio of satisfactory and unsatisfactory estimates leaders are railways and the airports, outsiders are the highways. (At the same time, the proportion of satisfactory estimates, as well as the modal estimate at the airports is slightly better than that of the railway infrastructure). Seaport infrastructure estimates (which began to be recorded only in 2013) are not high, but still better than on the highways. These are very significant results, demonstrating the advantages of privately owned transport infrastructure (even if the owner, as in the case of the railway infrastructure, is a company whose shares are wholly owned by the government). In turn, almost completely "state" highway infrastructure is in worse condition.

On the other hand, the condition of the highway (according to the business community estimates) has a clear tendency to improve. The increase in the proportion of satisfactory grades and the average score, the increase in modal and median grades from 2007 to 2016 indicate this.

There is no clear trend in the railway and seaport infrastructure. As for airports, we can talk about an unstable tendency to improve.

Table 1. Dynamics of the transport infrastructure condition estimates by Russian entrepreneurs, % (Russian Union of Industrialists and Entrepreneurs, 2016, p.34)

Transport infrastructure condition estimates	Highways			Railways			Seaports		Airports		
	2007	2011	2016	2007	2011	2016	2013	2016	2007	2011	2016
1. Bad or very bad	47,5	21,0	17,3	9,6	7,0	8,4	27,0	20,0	18,2	18,8	13,0
2. Rather bad	18,5	34,7	25,0	9,4	17,4	13,2	13,5	20,0	13,7	19,9	7,2
Total share of unsatisfactory estimates	66,0	55,7	42,3	19,0	24,4	21,6	40,5	40,0	31,9	38,7	20,2
3. Medium	14,4	21,6	25,6	22,3	40,7	26,4	27,9	24,8	22,6	29,6	25,4
4. Rather good	11,5	17,9	21,8	25,1	20,4	28,5	19,8	22,9	22,7	22,7	26,1
5. Good or very good	8,1	4,8	10,3	33,6	14,5	23,6	11,9	12,5	22,8	9,1	28,3
Total share of satisfactory estimates	34,0	44,3	57,7	81,0	75,6	78,5	59,6	60,2	68,1	61,4	79,8
The average score (on a 5-point scale)	2,1	2,5	2,8	3,6	3,2	3,5	2,8	2,9	3,2	2,8	3,5
Transport infrastructure condition modal estimation	Bad or very bad	Rather bad	medium	Good or very good	medium	Rather good	medium	medium	Good or very good	medium	Good or very good
Transport infrastructure condition median estimation	Rather bad	Rather bad	medium	Rather good	medium	Rather good	medium	medium	medium	medium	Rather good

Official Rosstat data make it possible to compare the dynamics of the development of railway and highway infrastructure (Table 2). The results of the analysis of Rosstat data are correlated with the dynamics of the Russian entrepreneurs' evaluations. While the main indicators for the railway infrastructure development have not changed much since 2007, the length of public highways has almost doubled. Thus, in the context of the insufficient level of private investment in transport infrastructure, although non-state infrastructure is in better condition, but is not developed. At the same time the governmental infrastructure is developing, but its quality is lagging behind the requirements of users. In particular, attention is drawn to the slow growth in the length of paved roads, as a result of which their share in the total length decreased by 12.9 percentage points. The share of roads with improved surface coverage has also been reduced.

**Table 2. The railways and highways development indicators change
(Rosstat, 2015, p.127)**

Indicators	2007	2011	2015	Change: 2015 to 2007
Railways				
Operational length, thousand km (at year end)	85	86	86	+1,2%
Specific weight:				
Of electrified sections, %	50,4	50,5	50,6	+0,2 p.p.
Two-track and multi-track sections, %	43,5	43,8	44,0	+0,5 p.p.
Public highways and roads				
Operational length, thousand km (at year end)	747	927	1481	+98,3%
Including roads with a hard surface, thousand km	624	728	1045	+67,5%
Specific weight of hard surface roads, %	83,5	78,5	70,6	-12,9 p.p.
Specific weight of improved coverage roads, %	68,8	65,8	62,3	-6,5 p.p.

In other words, the highway infrastructure development is more extensive, and its quality leaves much to be desired. It is no accident that, given the positive dynamics of estimates, the condition of the highway is estimated to be much lower than that of railways.

The situation with railways is different. Their ownership of JSC "RZD", which is a nationwide freight rail carrier, earning its income on the transport market, on the one hand, stimulates care about the infrastructure maintenance in a condition that allows the efficient implementation of the transportation process, and on the other hand – gives financial resources generated by the market activity (And this is an important argument in favor of the unity of railway infrastructure and transportation activities).

However, these financial resources are not enough to expand the network and to construct new railways.

It is no accident that the railway transport development Strategy adopted by the Russian Government in 2008 provided for the need to unite the efforts of all parties interested in the railway infrastructure development - not only the Russian Railways holding and the government, but also private investors and regions (Lapidus & Macheret, 2008, p.13; see also Lapidus & Macheret, 2015). On this basis it was planned to build over the period 2008 – 2015 5193 km of new railway lines, 2407,9 km the second and 348,5 km. the third or fourth paths, to electrify 3918 km of railway lines. However, given the limited financial resources of the Russian Railways holding and the state budget and the low investment attractiveness of the railway infrastructure for private investors, the indicators for the railway infrastructure development provided by the Strategy are, as follows from the table. 2, have not yet been achieved.

The solution of this problem lies in establishing the legal and, from a broader perspective, the institutional conditions for the private capital attracting to the railway sector to expand the market opportunities of JSC "RZD».

Attracting private investment is necessary for the development of infrastructure of other modes of transport – including highways and roads, traditionally financed by the budget. Therefore, the Ministry of transport position seems quite reasonable. It is focused on attracting private investment to the implementation of projects in the public-private partnership format with the use of various options of "long-term contractual relations with investors".

It is important that one of the priorities of such projects is the upgrading of the seaport infrastructure associated with the development of railways. In the main export destinations, rail freight flows are sent to the seaports, so the harmonious development of railway and seaport infrastructure is key to the efficiency of such transportations and significantly affects the competitiveness of Russian goods on world markets. Meanwhile, as can be seen from the table. 1, the Russian entrepreneurs assess the seaport infrastructure condition significantly lower than that of the railways. Seaport failures often complicate the movement of goods on the railways, disrupting the transportation process at significant sites of the network. And taking into account the implementation of such projects as the BAM and Transsib modernization, which will increase the export potential of the Russian economy, the requirements of entrepreneurs to the development of the seaport infrastructure will certainly increase. And it is necessary to prepare in advance for their implementation.

Of course, the transport infrastructure development (as well as infrastructure in general), with all its importance for business and economic growth, is not the "magic lever" by clicking on which this growth can be significantly accelerated. To increase significantly the growth rate, the transport infrastructure improvement should be carried out in conjunction with the public institutions' improvement and the development of human capital, which is the main component of the modern societies wealth. The latter problem should be paid special attention to due to the fact that, in the opinion of Russian entrepreneurs, one of the three most acute problems hindering entrepreneurship is the lack of qualified personnel. According to the foreign business evaluations, the lack of qualified personnel is one of the two most acute problems hindering entrepreneurship in Russia (Fleishman Hillard Vanguard, 2016).

Detailing personnel problems of Russian business by the personnel categories, it should be noted that in the first three deficit categories of employees are specialists of the highest level of professional qualification - almost half of the Russian entrepreneurs pointed to the shortage of such specialists. In this regard, it should be noted the importance of developing the training of the highest level of professional qualification specialists for transport itself, without which it is impossible neither the modern transport infrastructure development nor the long-term improvement of the efficiency and competitiveness of the Russian transport system.

Russia has a very strong tradition of higher transport education, founded in the XIX century with the creation of the Institute of communication engineers (now the PGUPS in Saint-Petersburg) and the Imperial Moscow engineering school of the Ministry of Railways (now Russian University of Transport). These were integrated transport universities, from which in the 30s of the last century specialized universities "rebuffed" by type of transport. It was associated with the differentiation of the transport complex management system.

Currently, the dominant global trends are the integration of different transport modes within multimodal transport systems and the convergence of the transport modes in the creation of innovative transport systems. This requires the integration of transport education, the development of new areas of training in inter-transport and general transport directions. The basis for solving these problems should be the implementation of the decision adopted by the Government of the Russian Federation on the establishment of the Russian University of transport on the basis of the Moscow State University of railway engineering (MIIT) - the head transport University of the country. The Russian University of transport (created in 2017) should become a system integrator of scientific and educational potential and the main types of educational activities in transport, ensuring the education quality for the transport sector of the country (Lyovin, 2017, p.84).

Considering the large-scale tasks provided by the Transport strategy of the Russian Federation till 2030 on the transport infrastructure construction, including high-speed railway and automobile communication, development of the specialists' education (in the field of transport construction including the design of the transport infrastructure objects, and also the transport construction economy) in the Russian University of transport is fundamentally important.

We should focus particularly on the problems of training economists for the transport industry. Transport is a dynamic system whose key components are in the process of spatial movement. Because of this, as well as the economic characteristics of transport production (transportation), transport economy differs significantly from the industry and other economic activities, and in many aspects, it is not just specific, but much more difficult than the other activities economy. Transport economists should know the subject area perfectly, including the problems of transport equipment, technologies, design and transport facilities construction. It is no accident that training of economists for transport and transport construction is traditionally carried out in the transport universities. MIIT has almost 90 years of experience in such training, carried out within the framework of the specialized Institute of Economics and Finance. It seems that at the Russian University of transport such training should be expanded in relation to the

integrated development of the transport complex, covering all modes of transport in their multimodal interaction.

At the same time, the close relationship between the technical, technological and economic aspects of the transport complex functioning and development, which is mentioned above, requires the restoration of the economic engineers' education in the field of transport and transport construction. Past experience shows that such training is appropriate in the form of a specialist.

Improving the quality of transport education in the Russian Federation will contribute to the successful implementation of the country's Transport strategy, bringing the transport infrastructure in a condition that meets the requirements of both the business community and the population of Russia, improving the Russian economy efficiency.

Thus, the transport infrastructure development in accordance with the requirements of effective business needs not only to stimulate private initiative based on the market institutions improvement but also in the development of human potential – including through the conclusion of a new level of higher education in the field of transport.

The systemic solution of these tasks will stimulate the growth of entrepreneurial activity, increase the pace and ensure the sustainability of the country socio-economic development.

Conclusion

The results of the business assessments analysis showed that, for example, in 2016, among the estimates of the highways condition the "average" rating (25.6%) was the most common, and of the railways – the "rather good" rating (28.5%). However, the modal estimate, being relatively more frequent, is not predominant. Moreover, the frequencies of different estimates can be very close. For example, in 2016, the evaluation of the condition of the highway as "rather poor" was characterized by a frequency slightly different from the frequency of the modal evaluation (25%). Therefore, the modal rating was complemented by the median. The median estimate is located in the middle of the cumulative distribution of estimates, that is, it characterizes the "central tendency" of estimates.

The results of the Rosstat analysis data showed that they correlate with the dynamics of estimates given by Russian entrepreneurs. While the main indicators of railway infrastructure development have not changed since 2007, the length of public highways and roads has almost doubled. Thus, in conditions of an insufficient level of private investments in transport infrastructure, non-state infrastructure, although being in better best condition, requires more acceleration. And the state infrastructure is developing, but its quality still lags behind the requirements of users.

Determination of the satisfactory and unsatisfactory rating proportion, weighted average score, as well as modal and median estimates makes it possible to characterize the transport infrastructure quality from the point of view of the business community in comparison by mode of transport and in dynamics.

Both on average and on a ratio of satisfactory and unsatisfactory estimates leaders are the railways and the airports, and outsiders are the highways. (At the same time, the proportion of satisfactory estimates, as well as the modal estimate at the airports, is slightly better than that of the railway infrastructure). Seaport infrastructure estimates (which began to be recorded only in 2013) are not high, but still better than on highways. These results are very significant indicating the benefits of the transport infrastructure in private ownership.

On the other hand, the condition of the highways (according to the business community) has a clear tendency to improve. The increase in the proportion of satisfactory grades and the average score, the increase in modal and median grades from 2007 to 2016 indicate this.

On railway and port infrastructure there is no clear trend in the condition change; with regard to airports – we can talk about an unstable trend towards improvement. In other words, the highways infrastructure development is more extensive and its quality should be improved.

The situation is different with railways. Their ownership of JSC "RZD", which is a nationwide freight rail carrier earning its income on the transport market, on the one hand, stimulates the care of the infrastructure maintenance in a condition that allows the efficient implementation of the transportation process, and on the other – gives for this financial resources generated by market activities.

However, we need to expand the railway network and build new railways. It is no coincidence that the railway transport development Strategy adopted by the Government in 2008 provided the need to unite the efforts of all parties interested in the railway infrastructure development – not only the "RZD" holding and the government, but also private investors and regions.

In the framework of the implementation of the Strategy, it is required to create legal and (from a broader perspective) the institutional conditions for attracting the private capital to railways - in the expansion of market opportunities for JSC "RZD" which is a core company of the Russian transport industry.

Abstract. *The paper studies relevant issues of construction machinery import substitution and positive economic implications and some approaches to assessment of multiplier effects created by import substitution in construction. One of the most important problems in construction is a problem of efficiency growth of machinery assets (machines, plant, means of transport and equipment) utilization. And if before it was to use machines as much as possible to get a rise in productivity, then now construction companies have enough equipment and need more assessment of its efficiency, based on degree provision definition. Besides, taking into account last foreign-policy developments there is a high relevance of import substitution issue in domestic production, including construction. That is why there is a high significance of production and delivery of domestic machines that can provide independent process execution and technological development. Provision of construction sites with machinery has a row of important special aspects for such a big country as Russia. In Europe, the vast majority of construction projects with the exception of the Alpine region are located in a habitable and populated area where there is a good infrastructure. In Russia, on the contrary, the majority of construction projects is pioneering and builds up infrastructure. It takes some particular machine independence during the service life of the production facilities. The complexity of delivery of replacement parts, service teams and maintenance vehicles to constructions sites increases the risk of wasted time that leads to the decline of machine train economic indicators and construction lags. That is why in Russia there has been a priority in favor of repairable systems when there has been a maintenance capability in construction sites. The second feature of Russian construction machinery is the mobile character of connection between actual maintenance cost and estimated maintenance cost. Since Russian pricing is based on unit costs then technical recourses included into them are taken into account in the cost estimates. Estimated cost in its turn determines first contract cost in any tender. The practice of fixed price contract implementation does not make it possible for construction*

companies to take into account economic operational features of their own fleet of construction machinery. The goal of the research is to determine how parameters of equipment configuration affect the estimated cost, industry-specific and national economic indicators. The research is based on methods of retrospective statistical analysis with a representative selection of production figures. It made it possible to synthesize multiplying indicators that characterize being provided with construction equipment.

Keywords: *construction machinery; import substitution; efficiency; cost; multiplier; economic effect.*

Introduction

About two-thirds of the estimated cost are expenses determined by the appropriate configuration of fixed assets. In modern construction, a great importance is attached to plant and equipment since the realization of infrastructure projects often depends on them. Besides, the choice of equipment determines not only investment volume but macroeconomic effect too. It needs to understand, that production norms are the source for estimate norms, that they take on the role of a measure of organizational and management decisions in production and have first-rate importance in construction regulatory regime improvement. Turnaround efficiency in the normative system is determined by choice of main points of fixed assets current status in construction.

These main points should be considered to be:

1. Operability of machine maintenance rates. All the stages of construction projects implementation take regularity in resource and cost indicators updating for the different degree of detail – for a construction company, for a construction site, for a construction crew and a construction machine. It means that standards are supposed to be structured according to the degree of consolidation and utilization during the construction process.

2. Economic feasibility. Different standard bases (federal, sector or company bases) elaboration and operating are to be unified with construction processes. Profit, profitability, expenses – these concepts may include both productive activity and standard-setting activity. On the one hand, standard-setting activity should be considered to be a separate investment project with its structure and expenses (noncurrent – for standard elaboration and current – for standards system maintenance). In this respect, standard-setting activity is like a consulting activity. On the other hand, standards are to include prerequisites and opportunities of construction operations activity and all of its subjects, including construction crews, investors, and the state budget. Taking all the construction process participants economic interest into account and providing cost-effectiveness indicators at an acceptable level determines the positive effect of investments into standards elaboration and implementation.

3. Information capacity. According to its content, shape and structure standards are to be a unified system with participants' access opportunities, information analysis and accumulation of data analysis opportunities, projection systems integration opportunities and process engineering integration opportunities. Standards updating procedure is not to be held since the very beginning, but through a context correction, providing cost saving.

4. Complexity. Standards support of construction is to be a system of resource and cost norms like all the stages of investment and construction project (from start to finish)) are to be unified. For construction production macroeconomic indicators assurance standard system is to operate unified indicators including labor movement indicators that are enlarged depending on target purpose of the standards. At the same time, there may be more modern construction needs and they are to be worked up more.

Taking it into account search and grounding of economic indicators of technical provision and recommendations creating for construction companies should be considered to be a relevant scientific issue. In modern Russian scientific literature problems of fixed assets either in different types of construction or in great construction projects are basically described. The relevance of conducted researches is a macroeconomic appraisal of construction fixed assets independent of interests of certain participants of the construction market. And that determined the purpose of the research – multiplier models development of sectoral production figures impact on macroeconomic indicators of economic growth.

Methodological approaches

The methodology of the research is based on economic approaches making it possible to estimate imported equipment availability in project recourses and analyze cost implications for construction projects.

This research identified specific features of the imported equipment impact on both technological and cost indicators. The influence of the applied imported equipment was differentiated by types of work and equipment range according to the methodology of estimated cost analysis (Solovyev, 2017). During further calculation of construction cost consolidated indices the difference of estimated cost under the multiplicative effect of the investigated factor reached in some cases even double overpricing comparing with the variant when all the works were completed only with domestic equipment.

There is an applied problem how to identify the connection between resources configuration factors of construction operations and macroeconomic implications. The solution of the problem is made by a multiplicative method which keeps the inherent functionality of the system, unlike a simple statistic description. It is relevant, including for the production process based on the described technological dependences.

Among three multipliers known in the modern literature (a multiplier factor, an operator of the chain economic reaction and a sequence of generated effects in other sectors) (Lukashev, 2003, pp.27-38) the following type of the multiplier was chosen to determine economic role of construction machinery import substitution:

$$M = \frac{I}{P+I};$$

I – construction machinery import substitution investments

P – profit for plant and machinery replacement with import-substituting production.

It is well known that nowadays construction only consumes production facilities, but do not produce them (Kaverzina & Lukovnikova, 2014, p.48), although in 70s – 80s of the last century construction companies created a lot of construction machines eliminating their scarcity. Since generally there was still a scarcity of construction machines any new asset had high indicators of utilization efficiency. This trend still exists in the current economic environment as well (Pankratov, 2012, p.75). That applied to the equipment of both factory production and construction companies own production.

On the basis of post-event analysis, it is possible to highlight 3 models of equipment utilization:

Model A (1973 – 1986 years): basically there was the provision of domestic machinery and creation of production facilities by construction companies if there was a scarcity of production facilities.

Model B (1990 – 2004 years): there was a significant decrease in domestic machinery production followed by a dramatic rise of import.

Model C (2005 – present time): Russian market saturation by both imported and domestic machinery.

Table 1, compiled on the basis of the data of Federal State Statistics Service (FSSS, 2018) and as a result of analyzing of a row of sources (Apatenko, 2015; Solin, 2011), presents return on assets (or capital productivity) ratios (in brackets – for machines produced by construction companies) and shift system factors K. As it is seen from the table 1, capital productivity of the irregular lifting appliances is much more than the same indicators for the machines produced in-state engineering factories.

Table 1. Machine utilization indicators in construction

The group of machines (the type of cranes)	Model A					Model B	Model C
	Percentage of production produced:			Average indicators			
	In factori es of former USSR	Abroa d	By constru ction companies	Capital productivity , R _a	Overage machin e shift, K	Capital productivity , R _a	Capital productivity , R _a
Railway cranes	78	23		1.07	0.8	1.04	0.97
Semimobil e cranes	84	13	3	1.12 (1.27)	1.4	1.03	0.86
Trestle cranes and pillar cranes	100			1.1	1.4	0.95	0.79
Tracklayin g cranes	96	4		1.08	1.6	0.9	0.8
Jib cranes and special cranes with lifting ability less than 10 t	68		32	1.06 (1.42)	1.7	1.02	0.74

The representative selection was limited by construction projects with rotating scheme of work organization according to the statistics of transport construction sector. That time there were three sequenced budget-normative bases (1969, 1984 and 2001 years). But nowadays capital productivity indicators of building machinery of many Russian construction companies are even less than 1, that shows underuse of equipment in construction combined with high operating costs.

The authors' research in construction cost estimating showed that regulatory framework (both technical regulation and estimate norms) depends on engineering capability, facilities, and their conditions. In the research changes of indicators of fixed assets in use, utilization were analyzed. The period under report is the budget-normative base activity of the 2001 year. Taking into account that the base was introducing gradually with a considerable delay, the analysis of dependencies is performed including indicators of 2005 and later. The analyzed process is construction and transport machines capacity decrease because of their depreciation. The difference between standard capacity and working one determines the economic effect, while the standard technological capacity value is static. Conditional equality in standards initiation means correspondence of actual capacity and a standard one.

$$C_{act}=C_{norm},$$

C_{act} – empirically defined actual sector average machine capacity (according to the types of machines).

C_{norm} – standard machine capacity

During the time of the operation of the standards the indicators of fixed assets in use change and break the equivalence – standard capacity does not change and actual one may both grow and fall due to machine train depreciation. According to the statistical data for the time of standard base validity the second case is more characteristic. The capacity proportions can be defined correcting the current average sector level of machine capacity.

$$C_{fact}=C_{new}-C_{dep}*K(1-D)-DK_{dep}$$

C_{new} – sector average level of machine capacity during the standard operation.

C_{dep} - degree of machine depreciation

D – share of worn out machinery

K, K_{dep} , - empirical proportionality factors

It is possible to calculate it knowing proportionality factors, showing declining dependence on depreciation degree (K) and full standard depreciation (K_{dep}). Taking into consideration research data about machine maintenance in construction it is possible to define K and K_{dep} , and it is also possible to conduct a conditional assessment of the correspondence of the actual and standard indicators of fixed assets in use at the sector level. The assessment is conditional because of the imperfection of production norm-setting. According to the Federal State Statistics Service data, the share of worn out fixed assets in construction is still on the quite a high level (table 2).

Table 2. Fixed assets of construction companies

	2005	2010	2011	2012	2013	2014
Fixed assets, billion roubles	264.3	703.9	906.3	910.5	944.5	1032.7
Fixed assets structure, billion roubles						
buildings, bil. rub.	26.2	23.3	20.4	21.7	22.4	24.6
structures, bil. rub.	9.9	13.7	16.3	13.8	14.0	12.4
machinery and equipment, bil. rub.	42.1	41.9	37.9	43.0	40.9	40.5
transport facilities, bil. rub.	18.4	18.6	22.9	18.9	20.2	19.8
other assets, bil. rub.	3.4	2.6	2.6	2.6	2.5	2.7
depreciation degree, %	42.0	42.5	38.7	44.2	47.1	47.3
percentage of worn out fixed assets	12.2	11.7	10.3	11.7	13.5	13.5

Economic effect E_m in the sector level is defined according to the criterion of estimation:

$$E_m = \sum_i^n P_{v-h,i} * (1 - \Delta C_i) * Y_{mt} * N ,$$

$P_{v-h,i}$ - Cost indicator of fixed assets in use, determined by standards. It is feasible to use standard vehicle-hour cost indicator for the macroeconomic purpose.

ΔC_i – The gap between the actual and the standard machine capacity

Y_{mt} – Annual fund of machine time, machine-hour

N – Number of units of the machinery

This approach for the effect definition has a disadvantage because it is averaged for construction work and means of equipment. But normative base contains a list in summary of machines and generalized parameters of their work calculating operating costs, that is why using standard and statistic indicators it makes baseline data population uniform.

The results of the calculation are presented in the table 3. Annual economic effect is determined for a particular case – railway cranes with carrying capacity – 10 t (railway construction).

Vehicle-hour cost=364,8 rub. in normative base prices of the 2000 year (table 3).

Table 3. Economic effect, defined by machine train production capacity

Indicator	Years			
	2000	2005	2010	2014
$C_{dep}, \%$	54.7	42	42.5	47.3
D	0.49	0.12	0.12	0.14
C_{act}	0.88	0.95	0.95	0.94
E_m , million roubles	26.3	10.3	10.7	11.5

Statistic data connected with machines that working life is over should be considered to be machines with an expired time of working life according to the depreciation rates. These machines transferred their cost to the cost of production and need to be changed, but machines renewal process has a low speed and there are no economic conditions for its renewal. The process of decrease of machine capacity due to the annual growth of repair and maintenance costs and wasteful expenditures of machine time was taken into consideration. For the proxy indicator return on assets can be taken, measured as a ratio of completed construction activity to the fixed assets value. For a description of functional relations between machine capacity and worn-out state, the values of $K=0,08$ and $K_b=0,2$ were used on the basis of return on asset ratio data according to Federal State Statistic Service and some construction companies.

The results of the calculations show that the economic effect is about 26 – 10 million roubles in a year. But in order to evaluate a real economic impact an economic effect of the base period should be taken into account. It is a specific feature of calculations based on base standards: all production and economic factors are taken into account by standards in the base period. In fact, due to the backlog of estimated standardizing from the construction technology, there is a significant margin in fixed assets conditions. And it is possible to make the methodology of economic effects calculation better. A formal approach determines the actual economic effect as:

$$E_m^{act} = E_m^{fact} - E_m^{stand}$$

E_m^{stand} – standard effect;

E_m^{fact} – practical effect

And then the actual effect will have the following values (table 4):

Table 4. The actual economic effect in sector cranes fleet

Indicator	Years			
	2000	2005	2010	2014
E_m^{act} , million roubles	-	-16	-15.6	-14.8

Negative values of the effects show that standard machine capacity values are less than actual ones in the following years. Some economic stabilization after the 1990s let construction companies upgrade machine fleet and make the share of imported equipment more. Estimated machine maintenance cost was formed in conditions of considerable lags of used normal and in bad conditions when the Russian economy and technologies were at the beginning of a move in the right direction. In practice, effect size is distributed in estimated cost in projects where the machines of the considered group were used. The considered example creates opportunities for productive-economic indicators accounting as a factor of a choice of a base period in pricing.

Results of the research

The research showed that using import substituting domestic resources (construction machinery) causes macroeconomic results – effects that can generally be represented for different aggregation levels. To add to it there is a methodological analogy with the economic implications of substitute construction materials utilization (Korchagin, 2015). Aggregation levels can be economic indicators of revenue, GDP, national income

and performance indicators of the sector and a company. Each of them is described by a set of investment activity components.

For example, the multiplicative relationship is described by the following dependencies:

- 1) Results and expenses: $D=M \cdot I$
- 2) Economic effect and expenses: $E=(M-1)M_i P_i$
 P_i – revenue indicator
 M_i – multiplicative coefficient
 I – investments in construction

Calculations show that multiplier rose from 1.18 in 2001 to 1.43 in 2017 during the current budget-normative base existing.

It is well known that one of the main principles of the budget-normative base is its correspondence to the scientifically based process characteristic, installed according to the current level of technology development in construction. For the last 25 years, domestic machinery production degradation led to the common usage of foreign machines and equipment (Pankratov, 2012, p.76). At the same time, budget-normative base is basically oriented for the domestic machinery usage. This fact is supported by project owners (JSC “Russian Railways”, for example) in order to prevent machine operating cost growth. When the authors were preparing estimating standards and rates and consolidated indices for railway construction in 2006 -2010 there was an opportunity to estimate maintenance cost of foreign machines and analyze its implication for an estimated cost of construction.

As the main hypothesis, the estimated cost dependence on maintenance cost was used. The calculation is connected with huge volume of cost accounting work, but for the only economic analysis its appliance is justified. The practical appliance is especially important for complicated and expensive machines such as tunneling shields, stripping equipment, cranes of greater load capacity. For these machines correlation ratios of estimated cost and cost per operator, hour were determined first. For the rest of the machinery, the calculation with components of expenses can be quite enough. Based on the project data analysis of some great construction projects in Russia it was found, that three components of costs had the greatest density of correlation relationship:

R – repair and maintenance costs (correlation ratio – 0.71)
 d – depreciation (correlation ratio – 0.94)
 M – move costs (correlation ratio – 0.67)

It allows us to express the dependence as (Pankratov & Pankratov, 2015):

$$AM_i = k_r P_i + k_d d_i + k_m M_i$$

k_r, k_d, k_m – empiric functional ratios

The indicator AM_i describes the growth of the construction cost of an average construction object using a particular construction machine. It helps to make a choice of machinery in advance (on the stage of an expert judgment) taking into account its economic features.

In fact, indicator calculation at the sector level is possible only if there is an actual information system with large-scale integration like foreign tracking systems of the normative base (Means and so on) that could generalize current parameters of resources provision in construction. The foreign experience shows possibility in principle of data exchange about resource requirement among different construction companies. This information is generalized and used for both standard base maintenance and evaluation of the sector indicators (social cost level, sector growth dynamics, mastering of scientific progress results). There is no a system like this in Russia. Current systems of information centralization do not have an opportunity to calculate target indicators. It explains three obstacles for high precise calculation:

1. Accounting systems in big construction companies are not in line with each other. At the same time, accounting frameworks in different companies are not comparable and there is no payroll accounting in operating cost. Accounting reporting is not tied to machines and that is why sector indicators are not in line with resources in the standard base.

2. Federal State Statistic Service does not have an aim of information provision of economic calculations of specific sector indicators. Respectively set of parameters cannot be regulated according to requirements of standard provision system evaluation.

3. Federal authorities of government control, in particular, Ministry of Construction, do not have authorities for production data collection even for federal standard database maintenance. This function can be realized only as a special scientific work throughout tendering procedures. This procedure is unacceptable for systematic work.

Finally, it is worthwhile to say that the main levels of impact analysis should be considered to be a level of a singular resource that can be averaged as a group resource. In the rest of the levels, regularity of economic analysis of the standard base state takes new regulations for the creation of additional information of production process accounting.

Conclusions

The authors made a conclusion that machinery import substitution in construction may decrease expenses and make construction product cheaper, and at the same time provide an inflow of investments in machine-building industry and encourage scientific-and-technological advance in the future. The results of the research let us consider state programs of machine-building industry development justified. Besides, the effective way of shortage control of specific machines is their local production, which is proved by domestic construction experience.

As a matter of experience, every thousand euro invested in plant and equipment causes a discounted economic effect equal to 468 euro - in construction industry, 190 euro - in construction materials industry, 78 euro - in passenger transport, 70 euro - in raw materials industry. Obviously, besides, there is also a positive social effect. The results of the research let us consider machinery manufacturing government programs to be relevant.

The multiplier paradigms proposed by authors make it possible to estimate economic implications of facilities investments. To make the measurement of estimated cost change is possible thanks to AM_i indicator that recognizes the average paradigm of construction machines configuration.

The practical significance of the research makes sense not only for the construction industry. Putting the methodological recommendations into practice will also let investors make a right choice forming investment budgets for machinery manufacturing companies. Meanwhile, economic effects will cover many economic sectors – mining and manufacturing industries, transport, banking sector and social services.

Abstract. *The development of small business affects the level of financial well-being of the population of the country, and as a consequence, to increase the quality of life of citizens. The article specifies that large-scale state support is being implemented in Russia, with the help of which activities related to the creation and improvement of the conditions for the development of small business are being implemented. However, each region has its own economic and social development features, they have different financial capabilities and investment and innovation potential. The article shows the dynamics of small business development in Russia in the Central Federal District. In this situation, problems of creation and development of small business in the regions of the Central Federal District have been identified and a mechanism has been developed for the development of a system of state support for small businesses.*

Keywords: *state support; small business; development mechanism.*

Introduction

Nowadays, the problems of small business development are the most pressing issues for the modern-day Russian economy paradigm. This is explained by many circumstances: small business provides high dynamics of economic growth, helps to solve the problems of economic restructuring, doesn't require significant investments, keeps a significant share of the economically active population busy and supports labor efficiency; causes the competitive environment formation and the market clearing. Furthermore, due to not great scale, small enterprises are able to respond more flexibly to changing economic conditions, as well as to consumer demand fluctuations, market condition changes, adding additional stability to the economy thus. In Russia, small business accounts for just over 22% of gross domestic product (Fig. 1). Economic and social functions of small business put its development in the category of the most important state tasks, make it an integral part of reforming the Russian economy. Meanwhile, small business is a risky economic activity due to a lack of resource provision. Small business without state support and without its own intra-group interaction is not always able to successfully resist large-scale capital in the competitive struggle and defend its political, social and economic interests. At this stage, there is a need to form new, expand and improve existing mechanisms of state support for small businesses. At the same time, the state's task is to create legal and economic conditions for their survival, the ability to grow and develop themselves in the market. The result of these investments is, in the final

analysis, a high level of quality of life for the population. Therefore, the main role in supporting it is currently assigned to the government. For comparison: in the European Union, the US, Japan, this figure is about 60% of GDP.

Figure 1. The share of small business in the GDP of Russia

Government support of small business in Russian

With the purpose of small business support, the Russian Government adopted a social and economic development program of the country by 2020. It reflects the features of assistance to small and medium-sized businesses. The use of the assistance forms is aimed at creating healthy competition, as well as improving the overall living standards of the population. Providing the government assistance makes it easier to start your business from scratch. While creating a company, an entrepreneur runs into shortage of money and information. The modern forms of assistance can help to resolve this situation. However, the government support isn't always enough for a successful start.

Figure 2. Dynamics of the small business enterprises number and their total turnover

The strategy of the socio-economic development of Russia by 2020 states the small and medium-sized businesses improvement is one of the main economic priorities. The government assistance activities aim to ensuring the development of SMEs as one of the most important elements for the market economy. In accordance with the implementation of this strategy, the government support is fixed at the legislative level. For instance, the contract system law (44-FA) obliges customers to purchase at least 15% of the total annual volume of purchases from small business enterprises.

Since August 2016, the Federal Tax Service launched a Single register of small and medium-sized businesses into commercial use. The register allows not only to systematize and make clearer the entrepreneurs' activity sphere, but also contains information about what affects the business reputation of SMEs, for example, information regarding contracts concluded in accordance with Law No. 44-FA or Law No. 223-FA. The second most important regulatory act regulating procurement activities is Law No. 223-FA, which provides for the obligation of corporate customers to fulfill the mandatory quota of procurement from small and medium-sized businesses in the amount of 18%. At the same time, at least 10% of this quota should be sent by customers to entrepreneurs according to the results of the purchases, which can be realized by small and medium-sized businesses only. Services for SMEs that facilitate making the state purchases "By now, there is a comprehensive system of free services and solutions on the RTS tender platform, which makes it easier for SMEs to participate in procurement.

Due to Government program "the development of small and medium-sized businesses", 7.5 billion rubles were allocated to 82 subjects of the Russian Federation in total in 2017.

Especially for small businesses, there are various free educational projects. As an example, within the framework of Russian national award "Business Success", organized by public organization "Support of Russia" in cooperation with the RTS-tender platform, special master classes for entrepreneurs are held, dedicated to the existing tax preferences and government assistance programs, as well as Express course "I am a supplier", where future participants of procurement can receive theoretical and practical knowledge necessary to start working in the field of state and corporate orders.

Today, the government support is carried out in the following areas: the creation of laws and regulations for assistance and development to business sector representatives; the organization of the personnel training for small businesses; the formation and provision of the social security system in the common business space; the creation of preferential conditions for using information, financial and other resources by business; the inclusion of representatives of the sphere in foreign economic activity programs.

Figure 3. Dynamics of state support of small enterprises

The ministers seek to assist those who have decided to start a business. The assistance is provided in accordance with the following programs: Federal, regional, sectoral and inter-sectoral, municipal. Annually, before the Federal budget submission the Russian Federation government introduces a draft federal program of the government assistance of small business in the Federal Assembly of the Russian Federation for discussion. The programs financial support is executed yearly at the expense of the budgets of different levels, as well as other sources. The mandatory annual allocations amount of the state aid is indicated in the expenditure part of the Federal budget; it goes according to law No. 88-FA.

Table 1. Forms and methods of the government support of small business

Forms and methods of the government support of small business	Notes
Financial support	
In a number of instances	The state provides financial assistance free of charge. But an entrepreneur must meet the requirements for the program participants. The volume of the subsidy can reach up to 300 000 rubles. The decision as regards providing it is made after the business plan analysis. There is a number of programs which allow you to get money on credit to start and develop your business at a low interest rate. Prequalification for trade shows and fairs is charge-free. The creation of youth innovation creativity centers (providing subsidies for the creation of centers in the amount of up to 7 million rubles per one support recipient)
The compensation of interest rates on loans	
Issuance of soft loans	
Provision of financial support to start-up entrepreneurs	
State and municipal guarantees on loans of commercial banks for projects of creation and development of small business	
Budget investment in fixed and working capital	
Financing investment projects	
Placement of products on free shopping sites	
Development of youth entrepreneurship	
Property support	
The provision of land property and premises for rent on favorable terms	An Entrepreneur can get for temporary use a plot of land or real estate. This allows you to save on purchasing your own premises from individuals. Business incubators –from 900 sq. m.; industrial parks –from 20 thousand square meters, industrial parks –from 5 thousand sq. m. Export support centers are being created
Transfer for temporary use or ownership of state or municipal property	
Support for export-oriented small companies	
Creation and development of infrastructure to support small businesses	
Information support	
Information distribution system	
Business information exchange networks	
Access of small business to software products for accounting and tax reporting	
Organization of international exhibitions and fairs	

Forms and methods of the government support of small business	Notes
Consultancy support	
The free counseling activities.	Events are held on the basis of employment centers, Federal tax service or business development Funds. Employees of institutions are ready to answer a question of an entrepreneur regarding taxation, accounting, planning and other areas related to the interaction with government agencies Regional business development funds periodically conduct trainings and lectures. They are aimed at helping start uppers. Anyone can visit them. However, you will need to pre-register
Business training	
Training, retraining and advanced training	
The development of educational programs	Within the program of the Ministry of economic development includes the provision of certificates for training, the recovery of expenses for staff training, retraining and the organization of training events regarding various issues of business
Creating conditions for professional development	
Educational, methodical, scientific and methodical assistance	

But, despite the extensive government support in the field of small business development, an entrepreneur faces a number of problems, which need to be studied in more detail. First of all, it is the instability in the application of taxation.

Problems identified while realizing the government assistance of small business

November problems of state support of small business note:

1. Methods of support of entrepreneurship, fixed in the legal acts are not implemented in practice.
2. Lack of an effective legislative framework
3. The tax burden is quite high.
4. Bureaucratization of public institutions entrusted with Supervisory functions
5. The lack of a well-developed system of business financing
6. The presence of economic problems Inflation, rising prices in all areas of production
7. A small amount issued on a Pro Bono basis, the Allocated amount is insufficient, and to get a loan for the start-up phase of the company is problematic.
8. Inefficient operation of existing structures and forms created to support small businesses a significant part of their functions remains unrealized cause is the imperfection of the business environment, especially in the field of innovation.

Figure 3. The mechanism of small business development

Conclusion

Summarizing the above, it can be said that the strategy for the development of small business today is a priority for the development of the economy. A special role in supporting small business is played by the state, as the development of small business will solve the problems of unemployment, increase labor productivity, saturate the market with innovative innovations, and resolve issues related to the inflationary instability of the Russian economy.

Abstract. *The monetary unification in Europe– the establishment of a single currency for all members of the European Union – has been conceptualized and promoted mainly in economic terms. The economics of monetary unification analyze the (mainly economic) costs and benefits that member states draw from replacing multiple national currencies with a single currency. The political factor has been habitually put aside as the benevolent despot view of the government was tacitly embraced with regard to the creation of the monetary union. Similarly, the process of euro adoption by countries that entered the European Union (EU) later is usually described as being driven by economic factors. The process of nominal and real convergence with older members has been carefully analyzed. Much less weight has been put on the complex interaction of economic and political dimensions during preparations for euro adoption, such as the political interests of national governments and their relation with major internal economic players. The multifaceted interplay of economic and political factors suggests the opportunity to take a political economy perspective on this complex issue. In this sense, a number of key political-economy related issues can be distilled in relation to the process of euro adoption, which will structure the following analysis. What are the key national winners and losers of this possible event? What role has interest-groups pressure played in this process? Under what circumstances may bureaucracies such as the central bank body of experts act as a deterrent for the political end that is the common currency adoption? How are internationally exposed companies expected to behave and to promote their interests in relation to this event? What is the relative importance of the internal politics dynamic for euro adoption? We rely on process tracing to approach these questions for the Romanian case. Policy documents, newspaper articles, academic articles, economic indicators and elite interviews are used to create an analytical narrative based both on a one-point-in-time description of the situation and on a timeline that lists the sequence of some relevant events. We argue that a specific combination of economic and political factors leads to the failed euro adoption in Romania.*

Keywords: *Euro; European Union; political economy; euro adoption; Romania.*

Introduction

The process of monetary unification in the EU – i.e. the establishment of a single currency for all members of the EU – has been conceptualized, discussed and promoted mainly in economic terms. The economics of monetary unification analyze the (mainly economic) costs and benefits that member states draw from agreeing to replace multiple national currencies with a single currency. On practical grounds, a policy-related issue – the necessity to replace the abandoned exchange rate as a policy tool in the hands of national governments – has been usually stressed. The academic and popular debates about the practicability of fiscal policy instruments gained momentum, as did the discussions about the effects that the availability of these economic policy instruments may have on national sovereignty. However, the political factor has been habitually put aside as the benevolent despot view of the government was tacitly embraced with regard to the creation of the Economic and Monetary Union (EMU). Political processes such as treaty negotiations, parliamentary ratifications, and popular referenda have been studied in relative disconnection from the economic arguments put forward in favor of this monetary arrangement.

Theories inspired by the analysis of the Optimal Currency Areas (OCAs) emphasize the best conditions for a country to abandon an autonomous monetary policy (Mundell, 1961; Frankel & Rose, 1998). A floating exchange rate system may successfully be abandoned if the economy has certain mechanisms able to act as built-in adjustment tools, such as internationally flexible and mobile capital and labor markets. In this case, the national economies of a monetary bloc may draw advantages from having a common currency managed by a transnational authority rather than multiple national currencies managed by national monetary authorities.

The rigorous theoretical construction on currency areas is unsuited to explain the monetary unification in the EU (Frieden, 2002). The EU is unlikely to meet all the conditions required for an OCA as labor mobility and correlation among exogenous shocks in various member states are still low. Even the initial, eleven-country eurozone may have not been the ideal area to form a monetary union. Similarly, it can be argued that the present-day drive for the enlargement of the eurozone is far from being an economically motivated process. Therefore, the ongoing political interest for the move towards monetary unification must be explained on different grounds.

One way to extend the narrow economic view on European monetary integration is to look at the factors that influence the behavior of politicians who ultimately decide on a country's monetary institutions. Frieden (1998, p.26) argues that there are three principal factors that made the euro politically attractive, given that a precise calculation of economic costs and the benefit is impossible: the quest for anti-inflationary credibility, the links between the common currency and the European integration, and the support from the powerful business interests. Germany has been a champion of low inflation and monetary soundness and the countries with a weaker monetary record have tried to reinforce perceptions by committing to the rules of the common currency area. Fearing of becoming second-rate countries, the national political elites of the outsiders would face strong incentives to participating in the monetary unification. Similarly, large pan-European corporations would be attracted to the exchange rate stability and would pressure national government to become part of the euro bloc.

Moreover, there are winners and losers of the European monetary integration and identifying these two groups may shade light on the forces at play in this process.

The multifaceted interplay of economic and political factors suggests the opportunity to take a political economy perspective on this complex issue. In this sense, a number of key political-economy related issues can be distilled in relation to the process of euro adoption, which will structure the following analysis. What are the key national winners and losers of this possible event? What role has interest-groups pressure played in this process? Under what circumstances may bureaucracies such as the central bank body of experts act as a deterrent for the political end that is the common currency adoption? How are internationally exposed companies expected to behave and to promote their interests in relation to this event? How did they in fact behave? What is the relative importance of the internal politics dynamic for euro adoption?

We rely on process tracing to approach these questions for the Romanian case. Policy documents, newspaper articles, academic articles, economic indicators and elite interviews with stakeholders in the euro adoption process are used to create an analytical narrative based both on a one-point-in-time description of the situation and on a timeline that lists the sequence of some relevant events. The descriptive power of process tracing is completed by the analysis of some causal inferences that this technique enables (Collier, 2011). Given the fact that the Romanian authorities have not yet made public a calendar for adoption, the relative importance of the aforementioned factors for this failure is analyzed. Since process tracing is particularly suited for gaining insight into causal mechanisms, this methodology is used for the study of the hypothesis that a particular combination of the variables advanced above concurred to the failed adoption of the euro by Romania.

Framework for analysis

Once the limits of the strictly economic perspective have been acknowledged, the process of euro adoption in the new member states of the EU (NMS) has been analyzed by studying the economic and political institutions and other features of the domestic environment in which this enterprise occurs (Dandashly & Verdun, 2015, Dandashly & Verdun, 2016, Johnson, 2006, Johnson, 2008). Tools derived from the political economy and comparative politics traditions have been employed to explain the diverse strategies that these countries enacted.

A first theoretical base for these applied studies is the literature dedicated to the political economy of monetary institutions that analyzes the monetary arrangements that individual countries choose in relation with certain political institutions. Given the time inconsistency and the inflationary bias of monetary policymakers, central bank independence and a predictable exchange rate regime (i.e., fixed exchange rates) evolved to insulate monetary issues from political pressures (Bernhard, Broz & Clark, 2002). At the international level, strategic interactions among governments, compelled by national concerns and constrained by the international environment shape the international monetary system (Broz & Frieden, 2001). However, both the perspective that emphasizes the national preference formation for a certain monetary arrangement and the view that focuses on strategic interactions among national governments in international monetary matters fall short in explaining the dynamics of the EMU. The process of monetary unification in Europe has been an unprecedented endeavor that

dramatically transformed economic policy and politics in Europe. Moreover, the sundry strategies of NMS towards euro adoption must be explained taking into account some elements of their internal political dynamic.

Writing at a time when the process of monetary unification was in its early stages, Feldstein (1997) stresses the importance of political motivations behind this move, given his assessment of the EMU as having a negative net economic effect. The desire to promote cooperation and peace while closely guarding national interests, the prospects of an increased cross-border bureaucracy, the willingness of the European political elite to bypass popular preferences related to a common currency have all been extra-economic catalysts for the European monetary unification process. The economic consequences may well be contrary to those expected, as an “artificially contrived” monetary unification is expected to reduce the volume of trade among member states and to increase unemployment (Feldstein, 1992). Friedman’s economic and political diagnosis is similar, given that the common market is not integrated well enough in terms of the freedom of circulation of goods and capital (Friedman, 1997).

The real factors of the EU’s currency policy (as opposed to the monetary factors) have been found to be significant, as exporters and cross-border investors tend to favor stable exchange rate. On the political economy of EMU, Eichengreen & Frieden (1993) are among the first to study the process of monetary unification in the EU simultaneously from an economic and a political perspective. The authors show that EMU is the outcome of a political enterprise and put forward three sets of political considerations as a point of departure in explaining the dynamics of EMU: interstate bargaining, issue linkage, and domestic distributional factors. The interests that the large economic sectors have in the monetary unification process have also been studied (Frieden, 2002).

The quintessential political nature of the euro is analyzed by Bagus (2010). He points out that the euro shares the same key feature with the rest of today’s currencies: it is fiat money. A governmental agency – i.e., the European Central Bank – is entrusted with the power and responsibility to issue the euro for the benefit of the European state. From this perspective, replacing multiple national fiat currencies with one European fiat currency bears no important economic advantages. In fact, the opposite case seems to be unfolding, leading to the author’s conclusion that the EMU is a self-destroying, conflict aggregating system since there is no externally enforced mechanism to restrict the money production and the cross-border wealth transfers that it requires.

This article seeks to add to this body of literature by studying the Romanian case of euro zone accession. We classify the factors for euro adoption into three categories. The economic factors include those criteria derived from the OCA theory, such as the economic structure and trade relation, labor market flexibility and the business cycle synchronization. The political economy factors deal with the actions of national and supranational bodies, such as the convergence criteria negotiated during the Maastricht process, the later addition of real convergence criteria, the exchange rate regime, interest group pressure, and the symbolic factor. The third group has to do with internal politics factors, such as the president, political parties and the central bank. The following section focuses on the analysis of some of these factors, while the third section concludes.

Money, politics and policies. The political economy of euro adoption in Romania

Interest group pressures: an apparent lack of interest

What role have interest group pressures played in the ongoing process of euro adoption in Romania? What groups can be identified that pushed for a rapid switch to the euro? First observation on this matter is that in general monetary policy is an area relatively isolated from interest group pressures. The lobbying groups have no means to exclude others from enjoying the benefits nor can they find an effective way to share the costs. Therefore, incentives to engage in this type of lobbying activity are weak (Broz & Frieden, 2001), at least compared to those situations in which the lobbying groups are able to exclude others from benefiting from the special treatment, such as the case of the trade policy. However, the lobbying activity of some groups has been identified and studied in relation with euro adoption in NMS. Haughton (2010) and Dandashly & Verdun (2015) study the Slovak case where the foreign business lobby, especially the automotive industry pushed hard in favor of euro adoption.

Like Slovakia, Romania too benefitted from an increased inflow of FDI, with the automotive industry being one of the main beneficiaries. As one of the key growth drivers for the economy, the local auto industry accounted for 47% of the country's exports in 2016, with Dacia (part of the Renault group), Ford and Volkswagen being the main car manufacturers (Romania Insider, 2017). However, the lobbying activity of this foreign-dominated industry appears to be quasi-absent (interview with BNR official, June 2018).

Money as a symbolic factor: a case of monetary realism

Identities, ideas and the symbolic value that people attach to their national currency are important factors that influence popular attitudes towards euro adoption. The different degree of attachment that people have towards national currency has been studied as an explanatory variable for the diverse speeds and strategies of euro adoption in the NMS (Dandashly & Verdun, 2015).

How much does the symbolic factor explain the Romanian strategy of euro adoption? First, trying to assess the degree of symbolic value that Romanians attach to the leu, one should look at the polls that address this specific problem in relation to euro adoption. The Flash Barometer results for 2018 reveal that in Romania a slight majority of the population (47% vs. 44%) disagree that adopting the euro will mean that their country will lose a part of its identity. The trend, however, is descendant, (with fewer Romanian disagreeing with the idea of a lost identity due to euro adoption) after reaching a maximum in May 2010 – 66% (EC, 2018b). Second, the quality of the national currency may be taken as a proxy for the degree of attachment felt by the people. Romania has seen one of the highest inflation among the countries in the region in the first decade of transition. Inflation rate reached 295.5% in 1993, fell in 1995 to 27.8%, only to increase in 1997 to 151.4%, staying at high levels until the late 2000s. As a result, the degree of currency substitution has been among the highest in the region.

In sum, the Romanian public does not see many advantages in using the national currency and turns to the common currency to save and to make current transactions, a fact confirmed by the high percentage of the public that has used the euro within their

country (around eight out of ten of the group of respondents who have already used euro banknotes or coins have done so in Romania or both in Romania and abroad) (EC, 2018b).

To conclude, it is safe to assume that the majority of the Romanian public tends to think of their national currency mainly in economic terms and does not attribute a great symbolic value to the *leu*. Therefore, the symbolic factor has not been an impediment for euro adoption in Romania.

We shall now analyze the internal politics dimension of euro adoption in Romania following the structure of factors of influence used by Dandashly & Verdun (2016) to examine the cases of the Czech Republic, Hungary, and Poland. The first set of factors includes electoral cycles and the role of the elites such as the presidency and political leadership along with the constitutional and legal constraints that they face, seeking to assess the degree of influence that these factors have on the euro adoption process. The second set of factors has to do with the central bank independence to assess how the preferences of the central bank elite impact the process. The last set deals with public opinion as we try to evaluate how the electorate may have influenced the monetary choice of the government.

Electoral cycles and the role of the elites: the declarative political support for the euro

On the one hand, the declarative support for an early euro adoption has been abundant among key political figures. Initially, the Romanian government had planned to adopt the euro in 2014, Prime Minister Emil Boc being so optimistic as to declare that even this date should be brought forward, stating that the government was working at a strategy for early adoption (Mediafax, 2009). However, this plan never came to fruition, 2014, 2015 and 2019 have all been abandoned as target dates. The first Convergence Program issued by the government in January 2007 contained a commitment to enter the Exchange Rate Mechanism II (ERM II) in 2012, while through the 2014 – 2017 Convergence Program the authorities committed to adopting the euro in January 2019. The rest of the programs contained no clear date for adoption, the government declaring in general terms its intentions to adopt the euro at some point in the future. The abandonment of the target was usually disclosed by public statement through the voice of the prime minister (or the finance minister), who emphasized the still unsatisfactory “readiness of the economy” as a key factor for the missed target (e.g., Gheorghe, 2017).

However, on the other hand, a clear timetable for euro adoption has never been made public. Coupled with the reserved attitude of the BNR with regard to an early euro adoption, this speaks to the duplicitous stance of the political elite towards euro adoption. Offering a rationale for euro adoption, the Romanian political discourse began to include elements specific to EU politics, such as the importance for Romania “to join the (eurozone) club” or to “have a seat at the decision table” (Șimandan, Leuștean & Dobrescu, 2017).

In March 2018, the ruling PSD voted at an extraordinary congress to back a 2024 target date for joining the Eurozone (Marinas, 2018). As a result of this decision, a national commission in charge of drafting the timetable for adoption was set up and began its activity. However, this pledge has little credibility given that Romania’s economic

conditions deteriorated in 2018 to the point that only one (i.e., the public debt) of the four nominal convergence criteria are likely to be met (EC, 2018a). Moreover, the recent expansionary fiscal policy implemented by the PSD government is incompatible with such an ambitious timetable for euro adoption.

As for the role of the presidency, according to the Romanian constitution, any law must be promulgated by the president, who is able to send bills back to the parliament for reexamination or to challenge them to the constitutional court. However, the president may do so only once since promulgating a reexamined bill is compulsory. Therefore, the president has no veto power in the Romanian constitutional architecture. In addition, the president has no specific economic role.

Since 2004, both president Traian Băsescu and president Klaus Iohannis publicly expressed their support for the adoption of the common currency. President Băsescu has been an enthusiast supporter both of the EU integration and of the eurozone adherence throughout his presidency. “I believe it should be firmly stated in our documents a target date, and an optimum time can’t be other than 2017”, he stated in an interview in 2013 (Caleaeuropeana, 2013). President Klaus Iohannis took every opportunity to affirm the country’s devotion to European values. In his view, joining the eurozone should become a “country project”, a condition for reaching this end, however, being a broad political consensus (Chiriac, 2015).

To summarize, we advance the idea that the political support for euro adoption has been a common feature of all the post-accession governments. However, the lack of concrete steps towards euro adoption coupled with the absence of a commitment to the calendar for adoption leads us to believe that the political support has been mainly declarative.

The role of the central bank: a cautious stance

Across time, the BNR has had a cautious approach towards euro adoption. Officials from the central bank have routinely emphasized the role of real-economy and political factors in addition to monetary factors for a successful euro adoption. Governor Isărescu has long championed putting the process of euro adoption in the framework of the real convergence set of arguments (Isărescu 2007, 2008, 2013, 2015). Unlike nominal convergence, which enjoys a clear-cut legal definition, real convergence lacks definitional precision. Among the criteria used to assess real convergence, per capita GDP has been analyzed in many documents originating from the BNR. The crucial contribution of the fiscal policy to meeting the criteria for euro adoption has been habitually emphasized (e.g., Isărescu 2008).

In the aftermath of the sovereign debt crisis, Isărescu (2013) argues that putting off euro adoption, at least temporarily, seems justified. Trying to rationalize this wait-and-see attitude of the BNR, he offers the following arguments: the common currency has gradually lost its appeal; the advantages of the euro have become less noticeable, while the disadvantages more clear; the reduction in financing costs (as a result of decreased interest rates brought about by the common currency) can no longer be considered a clear-cut benefit; the sluggish economic growth in the euro area makes the further commercial integration less appealing (pp.11-15).

In sum, we hypothesize that the cautious stance of the BNR – grounded in the slow advance of the real convergence – is a key variable to explain the sluggish move towards the common currency in Romania.

The public opinion: an unfulfilled enthusiasm

The public opinion factor may be taken as a proxy for the voice of the electorate that may influence the entire political process (Dandashly & Verdun, 2016, p.6). Romanians have constantly been among the most enthusiastic supporters of the common currency. Eurobarometer data for 2018 show that 69% of the Romanian population is in favor of euro adoption (the highest share, as in the previous report), compared with 27% which is against. The favorable opinion to euro adoption peaked in 2014, with 74% of respondents backing up euro adoption (with only 24% being against). The effect of the financial crisis on the positive perceptions of the euro has been modest: 62% of the population was favorable to the euro in 2008, declining only to 59%, 55% and 51% in 2009, 2010 and 2011 respectively, gradually increasing afterward.

There are several factors that can help explain the constant support for the common currency, notwithstanding the euro crisis. Firstly, given the constant high rate of inflation during the 1990's and the 2000's (in 1993) which resulted in a soaring degree of currency substitution, Romanians are not particularly attached to the national currency. Secondly, unlike other countries outside of the euro zone, Romania did not see the protective qualities of a flexible exchange rate regime. Although the real exchange rate of the leu depreciated by 19% between 2007 and 2009, the real GDP dropped by 7.1% in 2009. Romanians could learn that having an internally-managed currency is not an effective shield against outside economic shocks.

For these reasons, we theorize that the public opinion favorable to euro adoption has not been translated into an effective pressure on politicians to speed up the euro area accession. The freedom to use the euro for price quotations, savings, and borrowing, coupled with the fact that euro adoption has not been a salient issue, acted as a substitute for the necessity to officially adopt the common currency.

Table 1. Summary of economic and political factors for euro adoption in Romania (authors' own compilation)

Factor	Specifics
<i>Economic factors</i>	
Economic structure and trade relation	Improvement of the current and capital accounts; high degree of integration with the euro area through trade and investment
Economic cycle synchronization	Rapidly increasing since 2008
<i>Political economy factors</i>	
Nominal convergence	Maastricht criteria met only in 2015, 2016 and 2017; unlikely to be met in 2018
Real convergence	A slow advancing real convergence
Exchange rate regime	Managed float; a relatively stable real exchange rate
Interest-group pressure	Weak pressure for adoption
The symbolic factor	Not a deterrent for euro adoption
<i>Internal politics factors</i>	

Factor	Specifics
Presidency	Highly supportive; lack of economic responsibilities; no veto power
Priority of consecutive governments	Euro has been presented as a priority; lack of concrete steps towards euro adoption
Elites' support for euro adoption	Highly supportive
Central bank independence	Goal, instrument and financial independence; members of the board politically appointed
Government vs. central bank	Political cooperation until 2016; more conflict since 2016; BNR has had a cautious approach to euro adoption
Public opinion	Highly supportive; slightly declining with the euro crisis

Conclusions

A strictly economic perspective on the adoption of the common currency in the NMS falls short in explaining the widely diverse strategies that these countries embraced. A political economy standpoint, with its emphasis on the features of the internal institutional players and the expected behavior of national and supranational political actors, is in a better position to offer a more realistic view on this ultimately monetary phenomenon.

We have analyzed a number of economic and political factors that could help explain the sluggish advancement towards euro adoption in Romania. Even with the economic factors improving – the economic structure, trade relations, labor market flexibility, and business cycle synchronization have all moved towards greater compatibility with the euro area core – the political economy factors have not been particularly favorable to an early euro adoption. In addition, in spite of a euro-enthusiast internal public, the factors that relate to the domestic political life have not been able to push effectively for euro adoption.

Abstract. *The internationalization of companies has led to the diversification of demand for competences and to an increased competition in the labor market. For the labor market, it has become more common to adopt the concept of global citizenship in terms of competences and economic competitiveness when recruiting human resources. The global citizenship is the principal outcome of international education and is also linked to the internationalization of the curriculum. Developing the international curricula means preparing the graduates to live and work in a global world and enabling students to obtain both the social and the professional competences necessary to obtain a job anywhere in the world. In Romania, the employers have increased their demand for global competencies and practical skills in recent years due to the internationalization of companies and markets that are strongly connected to the necessity of hiring adaptable and flexible employees with analytical capacity and a high level of professionalism and integrity. These competences are found more and more often in employers' adverts for entry jobs. This trend has become challenging (seen both as an opportunity and a threat) especially for young graduates since they are facing the rapid changes from the labor market. Nowadays, the development of technology has facilitated the connection between the demand and the supply on the labor market via social networks or e-jobs platforms. The use of dedicated social networks for human resources recruitment has implications for the way the competition for obtaining a job at both national and international level changes and diversifies. The purpose of this article is to analyze the global competences required for the employment of young graduates of Economics in the Romanian labor market. For this purpose, the study aims to identify and to analyze the global competences required for entry-level jobs related to graduates of Economics (e.g. junior Accountant, junior financial analyst, junior Marketing expert). In this regard, the analysis is based on job requirements from human resources recruitment networks and e-jobs platforms (LinkedIn, bestjobs and e-jobs). Afterward, the paper synthesizes the results and builds a matrix of global competences based on the level of relevance; this matrix represents the fundamentals needed for designing the internationalized curricula.*

Keywords: *curricula; global competences; labor market; internationalization; competitiveness.*

Introduction

Major changes have influenced the international economy and the main changes have been the rapid development of direct foreign investment in national economies and the constant growth of international commerce (Cantwell & Janne, 2000; Hirst & Thompson, 2002, pp.98-101; Voinea, 2007, pp.31-32). The authors mention that the multinational companies (MNC) are responsible for direct foreign investments in local industries and that there are important changes in local markets as a result of their presence. MNC have brought also important changes in Romanian economy as Eurostat Report (Eurostat, 2014) highlights „in some selected Central European economies, such as Estonia, Romania, and Slovakia, the foreign-controlled companies play a substantial role in the economic performance in their economies”. Starting from these statements, the present study aims to analyze the implication of internationalization of the companies and of MNC presence in Romanian markets from the perspective of Romanian labor market demand for global competences. To achieve this, the paper will present, on the one hand, the main characteristics of global competences, the connections between the international market characteristics and the increasing demand for global competences, and on the other hand, the importance of global competences for increasing employability on the labor market. The role of this analysis is to identify which are global competences required by employers in order to help the universities to meet this demand and to apply changes in the curricula by providing high employability skills and competences. Thus, the literature review will show the categories of skills that form the global competences, the connection of each category with the specific feature of the international market and, ultimately, the importance of global competences for increasing employability of young graduates.

In the methodology section, the present paper will use for determining the most wanted profiles in graduates the technique of content analysis of internet-advertised posts for jobs on three social network platforms (LinkedIn, bestjobs and e-jobs) in order to describe in a systematical and quantitative manner the content of communication (Chelcea, 2007, p.568). For this purpose, we have selected 50 job adverts for young Economist graduates in which were present at least three global competences. Thus, by synthesizing and coding the data, we have built a matrix of global competences that shows which are the most important global competences demanded by Romanian employers.

The conclusions of this paper highlight that the global competences are often present in the job adverts for young graduates and this is a direct consequence of the Romanian labor market openness to internationalization.

Literature review

The global competences. Increasing employability in the labor market

The globalization process has brought many changes in the way companies perceive the development of their business and thus important changes in the process of recruiting the workforce. Also, the globalization is seen as the main factor leading to the development of the multinational companies or increasing the importance of an international component of the business/company. Companies' organizational culture plays an important role in becoming more innovative, taking advantages of work

creativity and gaining market advantages (Zhang, Larkin & Lucey, 2017). In terms of human resources, the innovative company is seen as an entity where all its members are involved in creating new products, services or processes (Sarros et al., 2008, cited in Zhang, Larkin & Lucey, 2017). Also, the same study mentions that in competitive and innovative companies, the employees are encouraged to develop independent thinking and creativity, to cultivate engagement and enthusiasm, to collaborate efficiently with the team, to know how to prioritize their tasks and to adapt and solve different issues. In this regard, starting from innovation and technology development we are witnessing nowadays the growth of the importance of global professions and global competences (van der Wende, 2018; WEF, 2016). These studies have showed that engineering is among the most globalized and regulated professions. The curriculum for science, technology, engineering and mathematics (STEM) is internationalized because their content is already universal, being facilitated by the use of mathematics and/or by computer languages as universal languages. Also, this complex of technical fields (STEM) “was among the first fields to switch to English”, being created and developed “in a global science system, with strong international cooperation and broad use of English as scientific lingua franca” (van der Wende, 2018).

If global professions are relatively simple to identify, for defining and understanding the global competences we propose a deeper analysis starting from showing the link between international markets’ characteristics and the recognized need for global competences on the international labor market. Before describing the correlation presented in Table no. 1, we will put forward a few general definitions and theoretical aspects regarding global competences.

The term of global competences is usually used with reference to curriculum internationalization (Morais & Ogden, 2011), employability (Yorke & Knight, 2006) and with global citizenship (Morais & Ogden, 2011; Shultz, 2007). Internationalization of curriculum represents the internationalization of the educational content, including the new teaching and learning instruments, distance learning, programs in a foreign language, interdisciplinary curricula covering more than one country, leading on the one hand to joint/ double degrees from different countries and, on the other hand, to internationally recognized professional qualifications (Kehm & Teichler, 2007; Knight, 2004; Nicolescu, 2014; Van der Wende, 1997).

Employability is defined by Yorke & Knight (2016) as “a set of achievements – skills, understanding and personal attributes – that make graduates more likely to gain development and be successful in their chosen occupation, which benefits themselves, the workforce, the community and the economy”. Thus, employability is seen as an individual adaptation through qualities and competences to meet the changing needs of employers and customers and is applied in different contexts by those in work or by those seeking work (McQuaid & Lindsay, 2004).

The term of global citizenship is used as a “multidimensional construct that hinges on the interrelated dimensions of Social Responsibility, Global Competence, and Global Civic Engagement” (Morais & Ogden, 2011). The conceptual model realized by Morais and Ogden (2011) describes each dimension of global citizenship, all three dimensions being important for increasing the employability in the perspective of increasing the transnational mobility of knowledge and skills (Shultz, 2007).

The global competences are the interpersonal skills recognized internationally (Deardorff, 2014; OECD, 2016, pp.4-6) and are related to a sum of abilities and expertise among which we mention: the ability to solve the problems and to find information, the ability to work under pressure, to develop and coordinate multicultural teams, the ability to deal with different communication styles, to hold international expertise, foreign language abilities, international market skills and general world business knowledge (Bush & Bush, 1998; Yu et al., 2005; van der Wende, 2018). The global competences are also called the “21st century skills” (van der Wende, 2018), covering four categories of skills needed in international markets: relational skills, motivational skills, perception skills and linguistic skills (Filip & Iamandi, 2012, pp.56-57).

The relational skills are related to interpersonal relation skills like flexibility, adaptability, tolerance, the cultural empathy, intellectual curiosity about the rest of the world, the ability to understand and not judge others’ cultural values (OECD, 2016, pp.4-6; Roberts, Kossek & Ozeki, 1998, p.100; Filip & Iamandi, 2012).

The motivational skills are related to self - confidence, personal interest for international experience and international environment, self-discipline, the desire to learn, develop and apply new programs or work techniques (Ken & Cheah, 2012; Filip & Iamandi, 2012).

The perception skills are in connection with the capacity to understand and analyze issues from multiple perspectives and also to take the best decisions in uncertainty conditions, creativity, critical thinking (Filip & Iamandi, 2012; Deardorff, 2014; OECD, 2016, pp.4-6).

The linguistic skills refer to foreign language abilities, especially to a very good knowledge of English language, as lingua franca, communication and non-verbal communication (Petcu et al., 2015, pp.12-13; van der Wende, 2018; Filip & Iamandi, 2012).

Starting from these four categories of skills, we can also identify the implications of the international markets in developing the competences and in increasing the requirements for global competences. Thus, the Table below shows the correlation between the development of the international market and the growing demand for global competencies establishing for each category of competence the international markets’ attributes that generated this demand.

The information from Table no. 1 highlights that not only one category of skills is needed for covering one specific feature of the international market. Competences like “Critical thinking” and “Personal interest for international experience and international environment” are generated by the complexity of the international market, “The capacity to analyze a state from multiple perspectives”. “Communication” and “Efficient communication in a foreign language” are generated by the heterogeneity of the international market, “Flexibility”, “Ability to learn new working procedures” and “Adaptability” are generated by the dynamism of the international markets, “Creativity” and “Customer orientation and results orientation” are generated by the competitiveness of the international markets, “Ability to prioritize the activities and to evaluate the available resources” and “Ability to evaluate the risks” are generated by the

uncertainty of the international markets (Danciu, 2009, pp.102-103; Filip & Iamandi, 2012; Guy, 2009, pp.8-13; OECD, 2016, pp.4-6; Vătămănescu & Andrei, 2014, pp.59-60).

Table 1. The correlation between the development of international market and the growing demand for global competencies (Source: Adapted from OECD, 2016, pp. 4-6; Danciu, 2009, pp.102-103; Vătămănescu & Andrei, 2014, pp.59-60; Guy, 2009, pp.8-13; Filip & Iamandi, 2012)

Characteristics of the international market	Category of skills	Global competencies	The need for global competences on the international labor market
Complexity	Relational skills Perception skills Motivational skills	Critical thinking Personal interest in international experience and international environment	To understand and evaluate complex situations To understand and anticipate new trends in international markets
Heterogeneousess	Perception skills Linguistic skills	The capacity to analyze a state from multiple perspectives Communication Efficient communication in a foreign language	To take the best decision under market heterogeneity To be able to communicate effectively with multicultural working teams
Dynamism	Relational skills Motivational skills	Flexibility Ability to learn new working procedures Adaptability	To adapt to different situations and conditions
Competitiveness	Perception skills Relational skills	Creativity Customer orientation and results orientation	To generate innovation for the company To generate profit and to increase the market share for the company
Uncertainty	Perception skills Motivational skills	Ability to prioritize the activities and to evaluate the available resources Ability to evaluate the risks Self-motivation and confidence to evaluate the international environment	To reduce the costs and resources used in current business To make the business more efficient To involve efficiently in growing the company's business in the international environment

The global competences are widely used in adverts when recruiting graduates. Studies have shown that a content analysis of internet-advertised posts of e-jobs platforms or social networks is used to identify the changing demands for competences on labor market (Ken & Cheah, 2012; McMurray et al., 2015; Roux & Jager, 2016). This type of analysis guides and helps all stakeholders to respond to the changes imposed by the globalization process on the labor market: universities when adapting the curricula; students when choosing their university, their programs and when applying for a job; employers when searching for the best employees; states, political and economic unions and international associations when establishing new policies for increasing employability (McMurray et al., 2015). Thus, this type of study is meant to show, on the one hand, the most important skills and capabilities required by the employers when recruiting young graduates, and, on the other hand, the gaps in the competences held by the young graduates and employers' demands (McMurray et al., 2015; Roux & Jager, 2016).

Methodology

Studies have shown that companies are dependent on resources residing outside the company (Sawyer & Sprinkle, 2003, pp.114-120; Gebert-Persson, Mattsson & Öberg, 2014). For the companies, it became more common to develop the connection with the human resources through e-jobs platforms or career networks (Gebert-Persson, Mattsson & Öberg, 2014).

Our study is using the quantitative approach of content analysis (Chelcea, 2007) when considering jobs adverts for Economics graduates in the Romanian labor market. The present analysis is using the information from three social networks and e-jobs platforms: LinkedIn, bestjobs and e-jobs and the analyzed items are all the adverts for junior Accountant, junior Financial analyst, junior Marketing expert and junior Economist. For selecting these jobs, we used the search function from the platforms during April and May 2018. In the first search, we found over 100 non-repetitive adverts (59 in April and 43 in May), containing the keywords junior Accountant, junior Financial Analyst, junior Marketing expert and junior Economist for Romanian labor market. Then we identified the most frequent 10 global competences present in the adverts and after that, the purpose of our study was to identify in one advert at least three global competences. Since the collected data were relatively small, we used for content analysis the Microsoft Excel worksheet and we selected 50 adverts for young Economist graduates in which were present at least three global competences as were defined in OECD (2016), Deardorff (2014) and Filip & Iamandi (2012). The selected global competences were:

- 1 Self- motivated person/ enthusiasm and commitment;
- 2 Very organized and detail oriented;
- 3 "customer first" oriented attitude/ delivering quality results to deadlines;
- 4 Excellent communication and writing skills/ good team skills;
- 5 Excellent knowledge of the English Language;
- 6 Excellent knowledge of German/ French/ Italian language;
- 7 Ability to work in a multinational/ multicultural environment;
- 8 Flexibility;
- 9 Good problems solving skills, thinking critically and an analytical mindset;
- 10 Willingness to learn/ eager to acquire experience in a professional environment.

The network approach to the study of global competences used on one hand the systematic analysis of empirical data and on the other hand the 0 and 1 coding for absence or presence of the global competences in the companies' adverts. Thus, synthesizing and coding the data, we have built a matrix of global competences based on the selection described above. In Table no. 2 we present the results in the form of a matrix in which the first column is represented by the adverts (from 1 to 50 as are described in Appendix) and the first line is represented by the 10 selected global competences.

Table 2. The matrix of global competences in Romanian adverts
(Source: Content analysis from LinkedIn, e-jobs and Bestjobs)

50	1	1	1	1	1	1		1	1	1	9
TOTAL	43	40	23	45	47	9	13	29	39	17	

Analyzing the results from the matrix we can identify the main global competences that are present in the adverts. For the employers, motivational skills like *self- motivated person/ enthusiasm and commitment* (43 adverts from 50 selected), perception skills and linguistic skills like *very organized and detail oriented* (40 adverts from 50 selected), *excellent communication and writing skills/good team skills* (45 adverts from 50 selected), *excellent knowledge of English language* (47 adverts from 50 selected), *good problems solving skills, thinking critically and an analytical mindset* (39 adverts from 50 selected) are the most important global competences that they search in a candidate when recruiting young graduates. Connecting this information with the companies' profiles presented in the Appendix, the matrix results are explained, on the one hand, by the presence of MNC in Romania and, on the other hand, by the internationalization process that characterizes the labor market in Romania (Eurostat, 2014).

The results regarding the presence of the global competences in the adverts are similar with those obtained in other studies - McMurray et al. (2015), Roux and Jager (2016), Jackson, Sibson and Riebe (2018), which show that skills areas required by employers include communication, decision-making and problem-solving, self-management and team-working skills. The results showed that the Romanian employers require workforce prepared for the international environment and the advertised posts present information regarding not only professional expertise, but also global competences when looking for hiring the best Romanian graduates.

Conclusions

The Romanian labor market has become aligned to the international market changes in terms of requirements for global competences, which is also valid in the recruitment of young graduates. The present study shows that competences like communication and excellent knowledge of the English language are the most required and they represent the key global competences that provide employability for the young graduates. Also, global competences from the category of the motivational skills (self-motivated person/enthusiasm and commitment) are in high demand, being present in 43 out of 50 adverts for Economics' graduates. Not only do the MNCs' adverts contain specifications regarding the global competences, but also other institutions adverts such as banks, financial and accountancy institutions have the same requirements. This could lead to the conclusion that the Romanian labor market has become aligned to international requirements in terms of demand for competences. Also, the global competences can be found in high percentages in job adverts, which signals that owning them leads to a high rate of employability. Thus, this study could guide the universities in designing the curricula specially to cover the gap between the demand and the supply of competences (Nicolescu & Păun, 2009) in the internationalization of markets context. By using this approach, the universities will provide internationalized learning for all the students instead of isolated international experiences for just a small number of students. For a thorough analyze of the supply of global competences as they are given by curricula, we need to undertake a different research, in order to establish whether the actual curricula are already internationalized, and in this case we need to identify what are the global competences that are missing from the curricula or whether we need to find the conceptual models for designing internationalized curricula.

THE ROLE OF LONG-LASTING DEVELOPMENT IN THE WORLD

Elena Florentina ZOTA

*The Bucharest University of Economic Studies
7 Aleea Valea Viilor, District 6, Bucharest, Romania
elena.zota@rocketmail.com*

Abstract. *Long-lasting development represents a national economy's ability to have equilibrium of the social, economic, technical and environmental points in the development process. According to the way long-lasting development is understood, as well as the application of the concept, there can be a long-lasting development politics where consumption and production are done by preserving the resources and qualities of the environment. In 1992, at Rio de Janeiro decided to lay the grounds of a long-lasting development commission as a UNO organism in order to implement the measures comprised by Agenda 21. Nowadays, economic growth can be achieved only as an economic-ecological growth based on a multi energetically consume and on a superior energy and material recycling, in which humans should respect nature's laws and be aware of the capacity of reproduction. A national strategy of lasting economic-social development should consider the services as a priority sector, able to develop and redress the Romanian economy in the context of its integration in the European Union. Environmental conservation strategies should be accepted on a global scale, and people should start thinking about a significant reduction in energy consumption without sacrificing comfort. In other hand, with current technology available, the global destruction of the environment could be stopped. In fact, Romania evolved from a "very poor country" until 2000 to a "poor country" until the EU accession and then to a "not so poor country" since 2007, but this achievement didn't help much in reducing widespread poverty. Last year, Romania outpaced Greece in GDP size for the first time in decades, to become the biggest economy in the Balkans. Integrating sustainable development goals at the heart of economic activities involves changing patterns of production and consumption. This change can be done through regulations, taxation, legal decisions, requests from the public.*

Keywords: *environment; healthy; pollution; government.*

Introduction

The concept of eco-development is defined as a lasting development in ecological respect. The natural environment means: the ensemble of conditions as: relief, climate, living creatures, in which the organisms live as a territorial complex which combines relief elements, geological structure and subsoil resources, waters, climate conditions, soil, vegetation and fauna. Eco-industry is not only the industry producing goods which prevent pollution, but also goods meant to measure, limit or correct equipment for water and residues treatment for example. Also, in the developed countries there is a severe legislation which imposes prevention and precaution, since any ulterior cleaning method of the does not succeed to eliminate pollution and clean it 100 %.

Long-lasting (healthy) development represents a national economy's ability to have equilibrium of the social, economic, technical and environmental points in the development process. According to the way long-lasting development is understood, as

well as the application of the concept, there can be a long-lasting development politics where consumption and production are done by preserving the resources and qualities of the environment. In 1992, at Rio de Janeiro decided to lay the grounds of a long-lasting development commission as a UNO organism in order to implement the measures comprised by Agenda 21.

The starting point and end point of economy is value as it is based on labor, use and actual existence of matter (substance, energy and information). Eco-industry is not only the industry producing goods which prevent pollution and also measure correct equipment for water and residues treatment. The long-lasting development is a continuous process of social change a global, regional and local levels with the purpose to ensure any opportunity for the present and future generations for better living standards. The minimum requirements enforced by long lasting development, which are include: preserving and increasing natural resources, maintaining the diversity of the eco systems, reorienting technology and controlling its risks, supervising the impact of the economic development on the environment, decentralizing the governmental forms, increasing the degree of participation in taking and unifying decisions concerning environment and economy. (Camasoiu, 1994, p.13)

A national strategy of lasting economic -social development should consider the services as a priority sector, able to develop and redress the Romanian economy in the context of its integration in the European Union. The humankind must create a society in which cars do not pollute the atmosphere, residues, regardless their nature (chemical or nuclear) are recycled and stored on adequate condition and energy production do not cause climate changes. On this time, a new concept has emerged, both at a practical and on theoretical level, that of eco-industry and eco-development. Eco-industry is not only the industry producing goods which prevent pollution, but also goods meant to measure, limit or correct equipment for water and residues treatment.

Dan Popescu (1997) argues that: in literature, sub-development is defined as a sum of features typical for the poor countries, among which we mention a low level of development of the main economic branches, and their weak integration in the system; the fundamental needs of the "minimum vital" are not satisfied and neither is the living cost, a low income on inhabitant that is unequally distributed; old social structures, underemployment of the labor force, low level of education etc. (Popescu, 1997).

To change the type of economic growth there is need of political and technological will and resources. Chances of success are very high. On the other hand, the environment is the support and the source of life. To pollute and destroy it equals to undermine human existence. That is why the World Health Organization came to the conclusion that maintaining health and well-being requires a good and harmonious environment in which everyone physical, psychological, social and aesthetic factors have a well-defined place. The environment will have to be in this for to be treated as a resource for the purpose of improving living and welfare conditions

In 1992 at the United Nations Conference on Environment and development, which was held at Rio de Janeiro and managed by Maurice Strong, approve the concept of long lasting development at worldwide. Starting with that time, all the authorities from all over the world have been obligated to implement local projects in partnership with the community agents involved in the long lasting development.

The minimum requirements imposed by long-lasting development include the following:

1. preserving and increasing natural resources
2. maintaining the diversity of the eco-systems
3. changing the dimensions of the economic
4. supervising the impact of the economic development on the environment
5. reorienting technology and controlling its risks
6. ensuring population number raise at an acceptable level in order to reduce
7. uncontrolled demographic growth
8. decentralizing the governmental forms, increasing the degree of participation in
9. taking and unifying decisions concerning environment and economy

The interactions and interdependencies between the branches of the national economy, between different activities and sectors, along with the economic growth, are increasing. The lasting development is a complex concept which are linked with the globalization processes, economic growth and development.

The lasting development have the following purposes:

1. reevaluation the economic growth according to resources and the focus on the quality aspect of production and services
2. eliminate poverty and the conditions for meeting basic needs for work, food, water, energy, health, dwelling
3. decentralization of government forms by increasing the degree of participation in the decisions and joining the decisions concerning environment and economy.

In fact, this concept refers to the development, which satisfies the present needs without compromising the future generations. Unfortunately, the reality is totally different and the gap between poor and rich countries is constantly growing. In September 2002, at Johannesburg, South Africa, was the World Summit on Long Lasting Development, which was attended by numerous representatives of the world governments, UN agents, NGOs, economic and social organizations and whoever was confronted with the alarming deterioration of the ecosystems. On the other hand, the long development model is an ideal theoretical model that guides the humankind, but that cannot become reality without political and social terms. Also, the Summit continued the ideas and in 1987 at Stockholm and in 1992 at Rio de Janeiro they adopted the documents.

Also, Jan S. Hagendon (1996) had introduced another concept which is more complete, about the sustainable development. Jan S. Hagendon says that "the idea of sustainable development more convincing if it is interpreted in the sense that a certain growth rate can be hard to sustain if the environment degrades itself, if the growing inequity of the income leads to revolution of if the population number gets out of hand or if the farming land is fragmented and the productivity decreases." (Hagendon, 1996, p.391)

The concept of eco-economics has been invented due to the fact that the market mechanisms do not reflect not even to a theoretical level the lack of concordance between the economic system and the planetary eco-system, also, Lester Brown (2001) tries to define this concept as it follows: "an economy which is in agreement with the

planetary ecosystem will sharply contrast with the present economy which is polluting, destructive and at the end self-destructive, wasteful, based on fossil fuel and centered on automobiles.”

In general, all human activities are helped by the environment. Thus, it has been noticed climate changes, erosions in the rural medium, growth of the quantity of chemical that affect the food and the air and water. We should be more careful with the environment, we must create a society in which cars do not pollute the atmosphere, residues, regardless their nature or chemical or nuclear are recycled and stored on adequate condition and energy production do not cause climate changes.

Therefore, big companies have been forced to introduce in their production system safer and more ecological methods and they partly reduced the pollution that has a negative impact on the environment. In the academic literature, the concept of eco-development is defined as a lasting development in ecological respect. The lasting development in ecological respect, spatial extension, takes into consideration implicitly and explicitly the environment factor. The environment can be natural, social, human, etc.

Figure 1. The effects of pollution
(Source: poluarea.wordpress.com)

The atmospheric pollution involves the release of substances harmful to living organisms in the atmosphere. The pollutants such as sulfur and nitrogen oxides, chlorofluorocarbons, carbon dioxide, carbon monoxide, and soot (coal) are the primary contributors to atmospheric pollution. The atmospheric pollution can also affect aquatic and terrestrial ecosystems, if the pollutants dissolve in water or precipitate in the form of rain.

The acid rain is a type of atmospheric pollution formed when sulfur and nitrogen oxides are combined with atmospheric vapor, as a resulting in sulfuric acids and nitric acids that can be transported away from the original site of production and can be precipitate in the form of the rain. The acid rain is currently an important subject of controversy due to its action on large areas and the possibility of spreading in areas other than the initial ones. Its harmful interactions include: erosion of structures, destruction of agricultural crops and forest plantations, threat of terrestrial but also aquatic animal

species, as few species can withstand such conditions, thus generally destroying ecosystems.

Different countries have imposed standards in legislation with preference at levels of concentration that are thought to be low enough to protect public health. Emissions Standards have also specified emission limits for pollutants in the atmosphere so that air quality standards are met. However, the nature of the problem requires the implementation of international environmental treaties, and so far 49 countries have approved in March 1985 the United Nations Convention on the Ozone Layer. The "Montreal Protocol", as it was called this renegotiated convention in 1990, called for the removal of certain chlorocarbons and fluorocarbons by the end of the century and assists with the development of countries in making these transitions. In addition, several international treaties have been signed to reduce the incidence of acid rain.

In the United States, the Clean Air Act of 1967, as amended in 1970, 1977 and 1990 is the legal basis for controlling atmospheric pollution. The Environmental Protection Agency is primarily responsible for meeting the requirements of this Act, which specifies to establish air quality standards for different substances. The global collapse of the environment is inevitable. Developed States should work alongside developing countries to ensure that the economies of these countries do not contribute to increasing pollution problems.

Figure 2. World's air pollution (Source: waqi.info)

The Waqi.info is an online portal, which has succeeded in setting up a map that updates real-world air quality in real-time. If Beijing does not see the sun ever because of the heady air, the cities in Romania seem to breathe healthier.

The global collapse of the environment is inevitable. Developed States should work alongside developing countries to ensure that the economies of these countries do not contribute to increasing pollution problems. Today's politicians should think about supporting pollution reduction programs rather than expanding industrialization as much as possible. Environmental conservation strategies should be accepted on a global scale, and people should start thinking about a significant reduction in energy consumption without sacrificing comfort. In other words, with current technology available, the global destruction of the environment could be stopped.

Direct effects are the changes that occur in the health of the population as a result of exposure to pollutants. These changes can be translated in order of severity by:

increasing mortality, increasing morbidity, developing symptoms or physiological changes, occurring direct physiological changes and / or loading the body with the agent or pollutants.

The environment concept is defined in the "Dictionary of Economics", as it follows: the ensemble of factors that can influence the economic activity from the exterior. The economic environment consists of all the natural and social restrictions that must be taken into account in the economic activity. The economic environment is also defined as an ensemble of institutions, of juridical, political and economic norms that regulate and orientate the economic activity.

In Durable Development, the key issue is represented by the reconciliation between the necessity of continuing the economic and social development and the protection and improvement of environment's state.

The sustainable development is the form of economic growth, which satisfies the needs of society in terms of well-being in the short, medium and long term having to meet the present needs without, however, jeopardizing those of future generations. This notion conciliates between the environment and the economy, representing a developmental pathway that supports human progress for the whole planet and for a long-term future. This approach is pursued the interaction of the compatibility of four systems: economic, human, environmental and ecologically, so as to meet the needs of the present without compromises the ability of future generations to meet their own needs.

The sustainable development strategy includes the simultaneity of progress in all four dimensions, as well, global development has as a general purpose the improvement of human life providing the necessary conditions for people to be able to achieve their full potential. Achieving this global goal requires the following objectives:

1. analyzing the present through the perspective of the future by introducing security ecological rather than maximizing profit, which is the true one purpose of sustainable development
2. changing consumer and production trends
3. establishing demographic growth
4. distributing the benefits of development to the entire population economic
5. the achievement of effective governance, i.e. the development of a political system
6. ensuring respect for human rights and freedoms
7. permanent and safe compatibility of environment created by man with the environment natural

Structural transformation is the process of shifting resource allocation to systems with high productivity so that the economy can sustain one higher living standards for the entire population, also appropriate administrative work, ensuring compliance with the law and ensuring that citizens have access to information of public interest are issues related to efficient governance.

The main objectives envisaged by the National Strategy of the Sustainable development are as follows:

1. ensuring the health of the population;
2. resizing and remodeling the economic and social structure turning it into a sustainable system;

3. developing a coherent, compatible legislative and institutional system with that of the Member States;
4. continuous monitoring and evaluation of economic performance, social and environmental protection through a system of indicators quantitative and qualitative determinants

The sustainable Development indicators are:

- be clear and statistically viable
- be obtained from the best data sources
- be harmonized from the point of view of methodology and standards international
- be comparable to those developed by the Member States of the Union European
- be timely
- be easy to review for updating

Also, proportion of land covered with forests and area of protected areas for ensuring biodiversity conservation are the two nature and environmental indicators biodiversity, indicators which protect biodiversity, prevent and reduce the desertification process by increasing the degree of desertification afforestation from 27% to 35% of the country's surface, until 2040 and through the increase of the protected areas' proportions from 2.5% of the country's surface in 1990 to 10% in 2015.

The success with which they are implemented will also depend on political leadership, institutional organization, available legal tools, financial and fiscal policies, and the accompanying plans for social transition.

The starting point and end point of economy is value as it is based on labor, use and actual existence of matter (substance, energy and information). Eco-industry is not only the industry producing goods which prevent pollution and also measure correct equipment for water and residues treatment. The long-lasting development is a continuous process of social change a global, regional and local levels with the purpose to ensure any opportunity for the present and future generations for better living standards. A national strategy of lasting economic -social development should consider the services as a priority sector (Ioncica & Stanciu, 2004; Rabontu, 2005), able to develop and redress the Romanian economy in the context of its integration in the European Union.

The humankind must create a society in which cars do not pollute the atmosphere, residues, regardless their nature (chemical or nuclear) are recycled and stored on adequate condition and energy production do not cause climate changes. On this time, a new concept has emerged, both at a practical and on theoretical level, that of eco-industry and eco-development. Eco-industry is not only the industry producing goods which prevent pollution, but also goods meant to measure, limit or correct equipment for water and residues treatment.

The concept of sustainable development has the world's wealthy and poor countries. For developed countries, the issue of depollution, improving the quality of life is one for transformation, adaptation and modernization. To change the type of economic growth there is, here, political and technological will and resources. Chances of success are very high.

Other hand, the environment is the support and the source of life. To pollute and destroy it equals to undermine human existence. That is why the World Health Organization came to the conclusion that maintaining health and well-being requires a good and harmonious environment in which everyone physical, psychological, social and aesthetic factors have a well-defined place (OMS 1989). The environment will have to be in this for to be treated as a resource for the purpose of improving living and welfare conditions.

Today's politicians should think about supporting pollution reduction programs rather than expanding industrialization as much as possible. Environmental conservation strategies should be accepted on a global scale, and people should start thinking about a significant reduction in energy consumption without sacrificing comfort. In other hand, with current technology available, the global destruction of the environment could be stopped.

We could also contribute to fighting pollution. We could stop the energy crisis using energy in a rational way. Some of the things we can do to save energy are:

- Rare use of cars: walking, cycling or public transport
 - Welcome to buying goods that are over packed. Energy is needed to make the packaging, but also to recycle it
 - Eviting losses: what you use, reuse, instead of buying new ones, repair damaged items instead of throwing them, and recycling as much as possible. Find out what recycling facilities are available in your area. Try not to throw things if they could have another use
 - Isolate your house: look for cracks in doors, windows, and make sure the bridge is insulated enough to keep the house warm.
 - Uses household appliances that do not consume much energy: when you buy new appliances, ask which models consume less energy. Use light bulbs with low power consumption and rechargeable batteries.
 - Ecoys water: it takes a lot of energy to purify water. A damaged tap can consume about 30 liters of water per day.
 - Learn as much as possible about Earth's energy problems and the causes that determine them. Find out if there are green groups in your area that could inform you.
- This is why nowadays, economic growth ca be achieved only as an economic-ecological growth based on a multi energetically consume and on a superior energy and material recycling, in which humans should respect nature's laws and be aware of the capacity of reproduction. In literature, sub-development is defined as a sum of features typical for the poor countries, among which we mention a low level of development of the main economic branches, and their weak integration in the system; the fundamental needs of the "minimum vital" are not satisfied and neither is the living cost, a low income on inhabitant that is unequally distributed; old social structures, underemployment of the labor force, low level of education etc.

The Sustainable Development Strategy has two main objectives as: high living standard in terms of water as well as reduction emissions of air pollution and keeping pollutants below a certain threshold and in order to avoid damaging human health, ecosystems and cultural heritage.

The indicators used in this respect are:

- percentage of population with access to drinking water sources

- the number of inhabitants who have access to a centralized supply system the water-
- connecting the population to centralized water and sewerage services-
- the ability to equip streets with water
- water losses in distribution networks
- the length of the water distribution network number of treatment plants;
- urban population exposed to air pollution, indicators reached by improving and developing the centralized system infrastructure
- water supply and sewerage systems in urban and rural agglomerations.

In the field of transport, the specific objectives refer to the fact that, on medium and long term, Romania must maintain a balanced system in which rail to hold 30-35% of the transport market, by internalizing costs external transport, through equivalent support for infrastructure development road and rail transport and supporting ecological transport.

To achieve these, the following indicators are used:

- the volume of freight transported, in terms of GDP;
- the volume of passengers transported, in terms of GDP,
- freight transport by type of transport;
- transport of passengers by type of transport.

The Sustainable Development Strategy is the reference framework for facilitating decision-making when some choices are incompatible. The strategies that have succeeded are those that:

1. have clearly defined the priorities
2. enrolled in a long-term optics
3. aims to promote consistency between the different existing planning frameworks already
4. promotes proximity at local level
5. translate a commitment at national level
6. Induce the participation of the actors concerned

The failed strategies are those that focused actions on a particular aspect, as: limited to punctual and isolated initiatives and the result of downstream approaches. The strategy must also include rating mechanisms in practice of the strategy. This process must be accompanied at the very beginning the process of formulating the strategy and must, of course, continue over time.

Surveillance of processes and result indicators must be the subject of a continuous supervision in relation to the final exam and objectives strategy. Romania has become increasingly attractive to investors. This is also happening as a result of the economic development that is growing more and more visible but also as a result of improving the country rating of the agencies International. Equally important is the setting of priority areas development, areas with a certain potential that do not involve too much investment to bring important economic benefits. Also, the strategic concept sets investment priorities in infrastructure and action plan at level national development in a European context.

Objectives of territorial development, and beyond, but must be established together with the representatives of local authorities who know best the needs of their communities represent. In faced with threats of irreversible environmental degradation, lack a complete scientific understanding of the phenomena taking place cannot be an excuse to postpone the required actions. Therefore, growth is necessary sustained productivity in scientific activity.

Conclusions

In fact, Romania evolved from a “very poor country” until 2000 to a “poor country” until the EU accession and then to a “not so poor country” since 2007, but this achievement didn’t help much in reducing widespread poverty. Last year, Romania outpaced Greece in GDP size for the first time in decades, to become the biggest economy in the Balkans (Turkey excluded).

This month, the National Institute of Statistics (INS) released a flash estimate of GDP evolution in 2017, indicating a 7 percent increase compared to 2016. The first more detailed picture of the country’s GDP in 2017 will be released on March, but economists are already betting on a number close to EUR 185 billion, after EUR 169.8 billion in 2016. What is already clear is that Romania’s GDP was larger in 2017 than Greece’s GDP, estimated at around EUR 175 billion, for the first time since the 1970’s. But Romania is still the second-poorest EU country if we look at the more relevant GDP/capita index, with less than EUR 10,000 per inhabitant.

Romania proposes for the following years:

- For 2020: Achieving the current EU level of the main indicators of sustainable development;
- For 2030: Significant approximation of Romania to the average level of that year of the EU member states from the point of view of sustainable development.

Integrating sustainable development goals at the heart of economic activities involves changing patterns of production and consumption. This change can be done through regulations, taxation, legal decisions, requests from the public, etc.

The objectives of sustainable development in Romania are:

1. Government and state institutions that, following the EU model, will facilitate Business Environment access to different tools for Sustainable Production and Consumption
2. Empowering the Business Environment "pressures", both on the part of the Government and the state institutions, as well as with the civil society
3. Awareness of civil society to "demand" products and services that have been designed following Sustainable Production and Consumption.

Nowadays, economic growth ca be achieved only as an economic-ecological growth based on a multi energetically consume and on a superior energy and material recycling, in which humans should respect nature’s laws and be aware of the capacity of reproduction.

sw.economics@yahoo.com*

Abstract. *The aim of this paper is to discuss the competitive effects of private equity industry in emerging industries, with a focus on the Dutch Life Sciences cluster located in West Holland, a Dutch region. As our analysis shows, the circumstances which favored the early success of this industry includes factors such as education, infrastructure, governmental support, existence of key industrial players, as well as the investment strategies of private actors. The paper is structured in two parts. The first reviews the literature regarding the evolution of emerging industries and the impact of geographic locations on their attractiveness to private investors. The second part highlights the way in which an emerging industry (i.e. life sciences industry in West Holland region) has upgraded its competitive advantage under the influence of private capital.*

Keywords: *agglomeration; clusters; private equity; emerging industries; life sciences.*

Introduction

The emergence of new, high-growth sectors is, along with disruptive ideas or reconfiguration of value chains, one of the strongest determinants shaping the competitive landscape these days (Russo, 2003). This paper attempts to highlight the role of emerging industries for creating competitive advantage under the influence of private equity.

The emerging industries take advantage of location-specific opportunities in terms of specialization and diversification, and they are more advanced in those regions which host a significant portfolio of traditional sectoral clusters (European Cluster Observatory, 2016). Generally, these industries require significant research and development funds as they try to raise private capital, but at the same time investors are attracted by their high growth potential and innovative approach of the incumbent companies. This virtuous circle of entrepreneurship helps industries develop at higher than average rates and take advantage not only of the capital inflows, but of the accompanying business and industry expertise as well.

In the following, we will subject to scrutiny the hypothesis of a virtuous link between emerging industries' competitive positioning and private equity inflows with a case study on life sciences in the West Holland region (The Netherlands). In the first part of this paper, we review the literature on the evolution, locational advantages, and

attractiveness of the emerging industries. The second part particularizes the way in which an emerging industry (life sciences) has taken advantage of private equity.

Theoretical background

According to one established definition, “emerging industries are either new industrial sectors or existing industrial sectors that are evolving or merging into new industries. They are most often driven by key enabling technologies, new business models such as innovative service concepts, and by societal challenges that industry must address as a matter of survival.” (European Cluster Observatory, 2012). In the European economy, these sectors account for about 46% of all traded industry employment and are concentrated in approximatively 20% of European locations (European Cluster Observatory, 2016).

The case for emerging industries is representative for what is disruptive and challenging in the contemporary business climate, with characteristics such as:

- New products/services resulting from technological development and socio-economical changes;
- Cross-sector convergences and applied innovation and creativity;
- Intensive research and knowledge;
- Changing business models;
- Uncertainty due to lack of information regarding the market conditions;
- Determined by agglomerations in areas with location-specific conditions, and strong inter-sectoral linkages;
- Requirements of significant research and development funds (European Cluster Observatory, 2012).

As this depiction suggests, two key features – location and risk associated with technological development – lie at the core of the business model of emerging industries. Let us turn to each of them to assess the key determinants in a competitive context.

Location mostly relate to clusters – groups of interconnected firms, and related private and public actors, which activates within an industry – as *drivers of competitive advantage*. A typical organization of clusters (Porter, 1990) includes companies, suppliers, other related companies, customers, educational institutions, public authorities, and regulatory bodies, all of these being related to one specific industry. The following graph shows a general approach of clusters’ organization.

Figure 1: A generic cluster environment (Author based on Porter, 1990)

According to Porter (2000), clusters affect business strategies in three directions, as follows:

- *Productivity*, because of the ease of access to qualitative information and technology, advanced-skilled employees and suppliers, and more support through coordination with institutions or other related companies.
- *Innovation*, because of direct competitive exposure to other companies' performances and innovative approaches. The proximity of customers brings more advantages for companies located in clusters, compared to isolated competitors, thanks to rapid ideas-to-market transfers.
- *New business formation*, because of the linkages created between clusters' members. Market opportunities are immediately seized upon in such agglomerations and new businesses arise taking advantages of new needs, lower entry barriers, and resources already available.

In light of the accumulated evidence (Marshall, 1890; Schumpeter, 1939; Porter, 1990), clusters' development can be explained through the advantageous use of resources – tangible and intangible – available in particular areas, successful past experiences of entrepreneurs and industry specialization. Cooperation between companies, suppliers, customers and institutions help clusters evolve. Local rivalry is another important factor which positively influences the development of such agglomerations through innovative improvements for changing needs in the marketplace. Since qualified labor is another pre-requisite for clusters' development, the whole business “community” takes advantage of high skills of employees and their continuous improvements.

Governments have a clear interest in supporting clusters since these agglomerations are conducive to increasing exports and are a constant source of attracting foreign investments (Porter, 2000; InterCluster, 2010; European Cluster Observatory, 2012). In the case of emerging industries, this support targets technological development, especially through regulations, improvements in infrastructure and education, or innovation grants oriented to specific business needs. Due to the influence of all these determinants, clusters develop and become stronger and stable in the market even during economic downturns. Delgado et al. (2016) conclude that strong clusters become more resilient to negative shocks, while the regional economy and the related industries take advantage of rapid recovery.

As for the *risk* associated to technology development and innovation, the existing evidence (Invest Europe, 2017) points to a virtuous circle from emerging industries to clusters and to private equity industry. In a context of optimal determinants of competitiveness, emerging industries are basically innovative traditional industries, which were transformed according to market trends; clusters are geographically agglomerations of high innovative companies, while the private equity firms are the financial supporters of innovative ideas. As long as innovative approaches are encouraged and financed, new industries develop, while the traditional ones are transformed. Their growth attracts specialized suppliers and support other related business sectors. The business environment is enriched due to new technological resources and because of increasing high skilled labor. Also, governments observe the power of the innovation and join this *cycle* through preferential and supporting policies. Investors receive high returns because of their financial and strategic support for the development of these disruptive ideas, and in the end, the whole economy benefits.

Figure 2: Linkages between emerging industries, clusters and private equity investments
(Source: author)

Private equity investments help industries, and especially the emerging ones, evolve through capital inflow and business expertise. Joining the companies and offering strategic advice, they support the increased productivity of investees and innovative products or services, at the firm level, and enhance competitiveness at macroeconomic level (Frontier Economics, 2013). Nonetheless, because each private investor accepts to take part of the growing plans of a company, the exit strategy is important, for shareholders will expect to benefit from the increasing value of their equity through an appropriate selling alternative. Even if companies will be sold to other players or will be listed on the stock exchange markets to increase their capital and to attract other investors, or another private equity firm will continue their development plans through fresh inflow of capital, or the management teams/owners will take back their shares, the divestment method should be a win-win situation for both the company and the investing firm.

For emerging industries, to attract private capital can be challenging because of their disruptive business models. Traditional financing instruments such as bank loans, overdrafts, credit lines, leasing or factoring, are limited for these companies because of the lack of collaterals (Masiak, 2017), while public investors are afraid of risks because of the difficulty of measuring the maturity of the industry. Moreover, because these industries are research-intensive industries the need of funding is higher compared with traditional sectors, so the companies which are active in emerging industries try to raise capital from private investors which are attracted by their high growth potential. Some alternative financing instruments available are venture capital (start-ups and early-stages companies financing), development capital (financing for expansion of mature companies), mezzanine (equity and debt financing through a subordinated loan) or distressed debt (financing for restructuring of troubled companies) (Seretakakis, 2012). A report of the European Investment Fund (Kraemer-Eis et. al, 2018) suggests that equity as source of financing for the SMEs of the Eurozone was mostly required for activities concerning companies' development such as developing and launching of new products or services and hiring and training of employees, compared with traditional instruments.

According to a report prepared by the European Savings and Retail Banking Group, the dominant financing sources for both European and American SMEs are bank loans. The report emphasizes that the banking sector is smaller in the United States compared with the European Union, but with a large access to capital markets. According to British

Bankers' Association (2014), in Europe 70% of total financed amounts come from banks, while in the United States bank lending represents only 30% of total financing, (70% of American financing is supported by capital markets and other institutions), in 2014. Moreover, banks usually provide significant amounts of money as debts for the private equity firms, in order to cover companies' acquisition costs, during buyout investments (Gilligan and Wright, 2010).

The Guide on Private Equity and Venture Capital for Entrepreneurs (2007) defines the private equity industry is defined by medium to long term investments in non-listed companies, with the purpose to pursue their development plans and to *create value* for companies in critical stages of development.

Several studies identified the economic impact of the private equity investments on innovation, productivity and competitiveness, as follows:

-Impact on Innovation. By allocating funds to research and development, private equity firms directly help investee companies to create new products and services, compatible with the changing needs of customers. Together with capital, the companies also receive business expertise and support for their corporate governance for the innovative plans. In order to highlight the direct effects of these capital inflows over the innovative potential of companies, Popov and Roosenboom (2009) studied the private equity investments and number of patents developed by private equity-backed companies during 1977-2004. Considering the patents as a proxy for innovation, they concluded that 12% of innovation by private companies is attributable to investments made by private equity firms.

-Impact on productivity. Investments made in physical capital such as plants and equipment increase the companies' productivity. Also, by improving their management, companies benefit from a better utilization of resources, which lead to development as well. The capital inflows also help companies develop and create new jobs, significantly contributing to economic growth. According to Frontier Economics (2013), the private equity investments led to creation of approximately 5,600 new businesses each year in Europe, based on 2007-2012 average numbers of new companies backed by private equity. The same study highlights the improved productivity of private equity-backed companies of 6.9 % on average, measured as EBITDA per employee. A study made by Kaplan and Strömberg (2009), over 1979-2007, with data from 17,171 worldwide companies backed by private equity firms, demonstrated the positive relationship which exists between the investments made by these firms and the performances of investee companies.

-Impact on competitiveness. At the local level, competitiveness between companies is enhanced through investments for increasing productivity. By attracting capital flows, companies produce more and improve their offerings, gaining more market share, therefore they become more competitive. Also, at the international level, private equity investments can lead to competitiveness by supporting companies oriented to export activities or by helping companies to expand abroad. New or small businesses have the opportunity to grow by receiving capital for internationalization efforts (Frontier, 2013).

The West Holland Life Sciences Cluster

Methodological orientation

To emphasize how the emerging industries, create competitive advantage, supported by private equity investors, an analysis of the life sciences cluster located in West Holland (The Netherlands) was made. The linkages created between the cluster members demonstrate cluster's success, and, in the same time, industry's growth perspective.

Following Porter's (1990) general cluster map, investors – as cluster's members – have a significant impact over economic growth of agglomerations, through their power of financing. Their influence over emergent life sciences companies is the focus of the cluster map analysis. Nonetheless, we are interested in highlighting private equity influence over the cluster evolution through financing support offered to big industry players in their early stages of development.

An overview of the Dutch business environment

The Netherlands ranks fourth as the most competitive global economies. According to the Global Competitiveness Index 2017-2018, the Dutch economy's competitiveness is supported by advanced infrastructure, a strong education system, but mostly by an innovative environment, with a high capacity of innovation (6th rank out of 137).

The country's *strategic location* is important for attracting customers – around 170 million customers within a 500-km radius, according to PWC Report (2017), from London, Paris, Dusseldorf, or Brussels, as well as for taking advantage of the spill-over effects of technological developments in neighborhood countries due to *its proximity to other European strong economies*. Their demand forces producers and suppliers to offer innovative solutions to remain competitive. The *research and development* grants allocated by the Dutch government are increasing from year to year, according to OECD statistics (OECD, 2018), around 2% of the GDP in 2016. These activities are also supported by special tax credits and other tax incentives. The *economic stability* of the Netherlands attracts foreign businesses and workforce. Foreign companies take advantage of special fiscal measures, while the expats are enticed with competitive benefits (PWC Report 2017). In this environment, private equity investors' interest is being attracted by innovative ideas. According to the Invest Europe statistics, the number of companies backed by private equity investors increased with 30% compared with 2010 and reached the highest level of invested amounts after the 2008 financial crisis.

Figure 3: Private equity investments in the Dutch companies
(Invest Europe/European Data Cooperative)

According to Leading Life Sciences Clusters in Europe Report (2016), the Netherlands is home of approximatively 63 life sciences parks, 12 universities and eight university medical centers, where ca. 98,000 people are employed (2014). The increasing innovation of the Dutch companies can explain the growth of emerging industries in this country. According to the European Cluster Observatory (2016), the South and the North Dutch regions are significant cross-sectorial hotspots in Europe in emerging industries clusters: out of the top ten emerging industries in the European economy (advanced packaging, biopharmaceuticals, blue growth industries, creative industries, digital industries, environmental industries, experience industries, logistical services, medical devices and mobility technologies), three of them are Dutch hubs, as follows:

**Table 1. Emerging industries in the Netherlands
(European Cluster Observatory, 2016)**

Emerging industries	Rank (out of 10)		Region	City
Blue Growth industry	5		Zuid-Holland	Rotterdam
Creative Industries	3		Utrecht	Utrecht
	4		Noord-Holland	Amsterdam
	8		Zuid-Holland	Rotterdam
Experience Industries	5		Noord-Holland	Amsterdam

One of the largest European clusters of exact sciences is located in *Amsterdam Science Park* and offers scientific opportunities for life sciences industry, together with high technologies, physics and chemistry. The cluster's development is strongly supported by academic and scientific institutions such as University of Amsterdam, VU University Amsterdam, the Academic Medical Centre Amsterdam, the Neuroscience Campus Amsterdam and the Pan-Amsterdam Technology Transfer Office (Leading Life Sciences Clusters in Europe Report, 2016). The *Utrecht Science Park* hosts the highest number of research institutions on a small area of 300-heactare and is focused on life sciences and health activities. More than 80 businesses are located in this cluster, together with the University Medical Centre Utrecht and the Utrecht University. Starting with 2012, a new business park supports the life sciences industry in the Netherlands, the *Pivot Park*, located in Oss. This cluster developed as mix of initiatives of government, existing companies and private equity investors. The pharmaceutical company MSD together with the municipality of the city and of the province, the Ministry of Economic Affairs and Ministry of Health, Welfare and Sports were the principal actors for this clusters' development. The financial support was offered by the Brabant Development Agency (BOM). Another very important life sciences hub in the Netherlands, is the *Zernike Campus Groningen*, founded in 1960s. In this park, there are around 150 companies, with more than 4,000 employees and researchers and approximatively 35,000 students. The University of Groningen and the Hanzehogeschool supports the clusters' knowledge (PharmInvestHolland, 2018).

The Life Sciences Cluster

The life sciences industry combines advanced technologies for developing medical facilities, pharmaceuticals, and other healthcare appliances. The European Cluster Observatory considers the biopharmaceutical and the medical devices as two different emerging industries but taking into consideration that these industries develop together in clusters, and they are closely interconnected, they are perceived as one industry.

According to the data provided by Biotechgate Database, the industry of life sciences in the Netherlands is developing from year to year, based on the number of companies which are active in this sector (including both the companies which are directly involved and related companies as well) and the number of new technologies created each year. The following table presents a short overview about the Dutch life sciences industry.

Table 2. Overview of Life Sciences Industry in the Netherlands
(The Dutch Life Sciences Trend Analysis 2014-2017, www.biotechgate.com)

Description/Year	2014	2015	2016	2017
No. of Dutch biotech companies	280	411	404	462
MedTech companies	102	116	102	122
HealthTech companies	29	40	38	39
Medical Facilities and other public organizations	116	135	128	181
No. of other life sciences related companies	659	813	803	877
No. of technologies developed	174	220	209	162

The life sciences and health industry's potential can be assessed also by taking into consideration the Dutch Association Innovative Medicines' initiative to transform the Netherlands into the "choice in Europe when it comes to research and development of medicines" (PharmInvestHolland, 2018). The life sciences and health industry is one of the nine key sectors of the Dutch economy, with more than 3,000 active companies and research organizations (PWC Report 2017). The Dutch life sciences companies exported more than 37 billion EUR in 2017, out of which 25 billion EUR are revenues from pharmaceutical products (PharmInvestHolland, 2018).

The development of this industry, not only in the Netherlands, but at the global level as well, started around 1590 with the invention of the microscope (Hans and Zacharias Jensen), and continued with other great discoveries, scientific, for example microbiology (Antoni van Leeuwenhoek), human anatomy (Andreas Vesalius) or physiology (Herman Boerhaave), or mainly technical, for example electrocardiogram (Willem Einthoven), or different medical appliances such as heart-lung machine and artificial heart (Willem Kolff), according to PharmInvestHolland report (2018).

According to Euro Health Consumer Index 2017, the Netherlands is the best country based on the healthcare system, because of the significant number of health providers, who act in competition, compared with other EU countries. The industry is supported by significant investments made in research and development, more than 2 billion EUR per year, according to the PWC Report (2017).

The *Leiden-Rotterdam-Delft-De Hague/West Holland* region is home of the leading life sciences cluster in the Netherlands, home of the three largest bio sciences parks and more than 400 companies, highly supported by five research and educational institutions and ten R&D facilities (West Holland Life Sciences Hub). The cluster's most important members are as follows:

1. Large industry players. The West Holland cluster hosts a significant number of large healthcare and pharmaceutical companies, which strongly influenced the evolution of the region. Some examples are: Crucell, Pfizer, DSM, Janssen (part of Johnson and Johnson), Thermo Fisher Scientific, 3M, Siemens Healthineers and MSD. Two of the most

important innovative solutions developed by the companies located in this cluster are for auto-immune diseases and the first vaccine for five childhood diseases.

Big players of the life sciences industry were supported by private equity firms in their early stages of development, such as Crucell (in late 1990), Viroclinics Biosciences (in 2001), and PanGenetics (in 2005).

Big players of the life sciences industry were supported by private equity firms in their early stages of development, such as Crucell, Viroclinics Biosciences and PanGenetics.

-*Crucell*, a Leiden-based company, was backed in late 1990 by the leading life sciences investor, Life Sciences Partners. In 2000, the company was listed on the Euronext Amsterdam stock exchange, and later merged with another life sciences company, Introgen. It continued as a public company until 2011 when it was acquired by the global pharmaceutical company, Johnson and Johnson, and today the company is one of the most important actors in the vaccines industry.

-*Viroclinics Biosciences*, a Rotterdam-based company, was founded in 2001 as a spin-off from the department of virology of Erasmus Medical Centre Rotterdam. It became a global clinical trial operation companies after it was backed by Gilde Healthcare, in 2014, and it continues its development with a new capital inflow from Parcom Capital, after it changed its main shareholder in 2017.

-*PanGenetics* is another example of private equity-backed company located in the West Holland (Utrecht) which rapidly grew up because of private capital inflow. According to Business Weekly (2006), the company received two rounds of funding for its drug development. Soon after its establishment in 2005, a 2 million USD seed round supported the research activities of PanGenetics.

2. *Knowledge institutions*. More than 6,000 students at renowned technical universities – TU Delft University, Leiden University, Erasmus University Rotterdam, Leiden Medical University Center and Erasmus Medical Center Rotterdam – are engaged in the cluster's research and development activities. For this purpose, there are ten R&D facilities available and three incubators.

3. *Government*. At regional level, the local authorities support this cluster through the West Holland investment agency which facilitates the companies' development, together with fiscal incentives for innovation. The West Holland region benefits of the Health Ministry located in this cluster. The Association of Innovative Medicine is another national authority, located in The Hague, which tries to create the best conditions for pharmaceuticals' development and manufacturing. In the same way, HollandBio supports the biotechnology companies. The local authorities support the life sciences companies not only through direct grants, but also through support to private equity funds. In 2010, around 35% of the funds raised came from the governmental institutions, according to Invest Europe statistics.

The public-sector supports the industry's development also through collaboration between the European Investment Fund (EIF) (part of the European Investment Bank) and the Dutch Minister of Economic Affairs for financing innovative companies. According to the EIF's website, the first collaboration, namely the Dutch Venture Initiative I, ended up in December 2016 with a total amount committed of EUR 148 million, to 13 different venture and growth capital investment funds, out of which 5 are exclusive dedicated to life sciences sector. In 2016, the second program was launched with focus on med-tech and life sciences alongside with ICT, clean-tech and renewable energy, fact that indicates the high level of innovation of these industries and how attractive they are for investments. Moreover, in September 2017, the Dutch Growth Co-

Investment Program was launched to support the transition of companies from early-stages to growth lifecycles.

4. *Patient Organizations.* For healthcare policies, the patient organizations (such as The Netherlands Patient and Consumer Federation (NPCF), Dutch Cancer Federation and other disease specific organizations - Parkinson Association and the Epilepsy Association) have a crucial role, especially for the new regulations. They play the role of sophisticated buyers for the cluster and all the research activities are conducted in order to satisfy their medical needs through innovative drugs or appliances (Van de Bovenkamp & Trappenburg, 2011).

5. *Supporting Industries.* The logistics hub from Rotterdam significantly influences the pharmaceutical imports and exports, not only in this area, but in the whole Europe. The Port of Rotterdam and The Hague Airport are vital for the international trade with medical and pharmaceutical products, as well as for strong connectiveness with other cities. High-technology companies supply life sciences companies with new solutions, for instance the 3D-printing used for medical appliances. In the same way, the chemical industry provides high-quality inputs for drugs development.

6. *Private Equity Investors.* Because the life sciences sector's activities are high research intensive, the demand of funding is substantial. The product development of healthcare companies requires more funding rounds compared with other business sectors. In some cases, after years of research, these companies obtain a prototype after 4 or even 5 investments rounds. In the West Holland region, Innovation Quarter, an economic development agency, supports financially the life sciences companies in this area. Alongside with this regional investor, there are also other private equity firms with a broader focus, such as Life Sciences Partners, Merck Ventures, Gilde Healthcare and Forbion Capital Partners.

According to Invest Europe statistics, the investments made in the West Holland regions, in the biotechnology and healthcare sector represents in average 21% of the total investments made in this industry (2007-2016 data). More than 60% of the investments are made in small and medium companies, in early stages of development. Also, in 2016, 23,29% of the total fundraising in the Netherlands was raised by funds oriented to life sciences companies (Invest Europe data). This inflow of funds, the highest since 2007, explains the increasing potential of the life sciences industry in the Netherlands and how attractive it has become for private investors.

The local authorities support the life sciences companies not only through grants, but also through support to private equity funds, therefore the aid is not only financial, but also strategic because of the business expertise of these firms. Another significant categories of investors for this industry is represented by the corporations, which can activate in the same sector or related, and academic institutions. The following graphs shows the type of investors which invest in life sciences funds in the Netherlands.

Figure 4. Type of investors in the Dutch life sciences funds (Invest Europe/European Data Cooperative)

The number of private equity backed-companies did not change significantly from 2007 until 2017, in average 11 companies received capital each year leading to increased workforce.

Figure 5. Number of private equity-backed companies and economically active population in the West Holland region (Invest Europe/European Data Cooperative, Eurostat)

Considering the economic growth of this region, mostly endorsed to the life sciences industry, around 13% of the increasing welfare is justified by the private equity investments made in the life sciences companies clustered in the West Holland, based on Invest Europe and Eurostat data.

Conclusions

Competitiveness at cluster level is enhanced through the high number of private equity-backed companies and follow-on investments which support the research and development activities. In the same way, new funding rounds increased productivity at the company level through expansion. But mostly, the private equity investments support the innovation in the West Holland life sciences cluster, throughout industry players, related-companies and governmental initiatives.

As this paper has emphasized, the success of the West Holland Life Sciences cluster is explained by a local context of strong cooperation between (1) large industry players, (2) knowledge institutions, (3) government and (4) patient organizations, (5) private

equity investors and (6) supporting industries, enhanced by the high competitive level within the region due to the large number of companies (the 18th most competitive European region according to Regional Competitiveness Index 2016).

The private capital inflows in this area are expected to increase in the following years due to the re-location of the European Medicine Agency from London to the Amsterdam. In the same way, some big industry players may change their operational activities in the European Union to take advantages of the community benefits, therefore the West Holland can become a better option for private equity investors instead of the United Kingdom, and a more successful life sciences cluster at the international level.

Abstract. *Labor productivity represents an economic growth factor together with labor and capital. Productivity affects inflation and exchange rate. Mismatching between wage costs and productivity favors increasing inflation. The competitiveness of a country is often analyzed through the correlation between wages and productivity. In this paper, we analyzed whether there is a correlation between productivity and wages in the industrial sector. In the analyzed period, January 2005-January 2017, the two variables – gross average earnings and labor productivity index – were strongly correlated, there is a very close linear association between them, which means that the evolution of the gross average salary in the industrial sector was closely related to the evolution of the labor productivity index in this sector. The industrial sector helped prevent the emergence of imbalances and dysfunctions in the economy by respecting these fundamental correlations between the gross average earnings and the labor productivity index.*

Keywords: *gross average salary; labor productivity index.*

Introduction

In this paper, based on data provided by the National Institute of Statistics, we aim to assess the impact of labor productivity on gross average wages in the industrial sector. In order to do this, we performed a statistical analysis of two selected indicators, which includes normality testing, correlation analysis and regression modeling (Druica, 2012). Based on the discovered association of the two variables, we built, as a result, the linear regression model which explains the nominal wages depending on the index of labor productivity in the industry (Duguleana, 2012).

We found this analysis suitable taking into account that the growth of labor productivity represents the foundation of real incomes increase and standard of living, and is the basis of income distribution in society as a necessary condition to avoid imbalances in the economy.

Theoretical aspects of salary, gross average wages, and labor productivity

Salary is one of the fundamental forms of income in the economy and it is of utmost importance in determining correlations between consumption and income, or between savings and investments. "The salary is the price at which transaction is made to exercise the factor production-work in a market economy" (Prahoveanu, 1998).

Salary is both revenue and cost. This double meaning gives it two opposite trends in establishing its size. The employee wants a salary increase to better meet the unlimited needs that s/he has, and the employer wants to reduce salary as a component of product cost. "In determining salary size, the economic rationality should be a priority, i.e. the ratio between the labor production factor productivity and the cost incurred by the company for this factor" (Prahoveanu, 1998).

According to Gheorghe (1999) "the substance of salary consists, at the same time, in the cost of the workforce and labor productivity. What the employee receives is a portion of labor product, conditioned by the labor productivity level".

"Labor productivity is somewhat a synthesis of the use of all production factors... However, because it is conditioned by the human production factor, labor productivity remains as important as man is to his creations, because all the other production factors – including the capital – are man's creations (as household means), while the coverage of human needs is the very purpose of household management" (Manoilescu, 1929).

The productivity or yield of the production factors is the efficiency of combining the production factors oriented to obtain the maximal effect with minimum resources (costs as small as possible). In the broad sense, productivity can be defined as the ratio between the quantity of wealth produced and the number of resources absorbed during production. Thus, it is basically determined as the ratio between the outputs (production - the output of an economic unit) and the efforts made in order to obtain them (the production factors used, i.e. the inputs). There are different ways of approaching productivity. Thus, in terms of the manner of measuring the established results, productivity is classified as:

- physical productivity - which measures the yields (in-kind) of the use of the production factors; it is expressed in physical units (natural or natural-conventional)
- measured productivity - which allows efficient financial-monetary measurement. It is widely used in the management of modern enterprises.

Another typology of productivity refers to the notions of:

- Gross productivity - which measures the production as a whole, with respect to the factors used (or the factor used). In this case, production is regarded as "final production", i.e. as a sum of the values added by various production activities.
- Net Productivity - which aims at eliminating – from the final production – the value of external acquisitions and the cost of using the installed capital (reductions in value, payments) in order to autonomize what is directly dependent on the productive effort of the analyzed company.

However, in the literature, productivity is addressed particularly in terms of the two consecrated types, namely:

- global productivity - which captures the effects of combining all production factors, measuring their overall performance and efficiency (Barre & Teulon, 1997).
- partial productivity - of each production factor, expressing the production obtained by using each consumed production factor (labor, capital, etc.)

Increasing labor productivity is the process whereby, with the same amount of work, we obtain a greater quantity of goods and services or vice versa, the same quantity of goods is made with less labor; it has a lawlike nature.

This implies a change in the production factors, in the way of combining them and, therefore, in the way of carrying out the working process. The productivity level of individual and national labor is under the influence of many primary and secondary, direct or indirect factors, which intertwine and sometimes act in different ways. Among these, we mention the following:

- technical factors - take into account the attained level of science and technology at a given moment;
- the economic and social factors - are connected to production and labor organization, both at the micro- and macroeconomic level, in terms of labor and living conditions;
- human and psychological factors - related to school education, culture level, adaptability to labor conditions, satisfaction offered, family life, the influence of religion and tradition in choosing the job. The workforce – the performers – and its rational use are decisive factors in the continuous increase of labor fruitfulness and, of course, of labor productivity.
- natural factors - related to climate conditions, soil fertility, accessibility of natural resources;
- structural factors - influence the level of labor productivity through changes in the structure of the national economy, by branches and sub-branches.

The economic agents are constantly concerned with increasing the yield of production factors and their efficient use, by resorting to different methods, depending on the material, human, natural and financial possibilities. Automation, robotization, the promotion of new techniques – essential coordinates of contemporary technical progress – entail productivity gains because they ensure higher productivity with the same labor costs, favor the diminishing of other expenses on products in general and increase savings.

Technical progress has increased the share of intellectual effort compared to physical effort, entailed more labor promptness and accuracy. In this context, the continuous raising of labor force qualifications is a prerequisite for the efficient use of human resources. Improving the organization of management, production and labor represents a complex, dynamic and continuous process that involves the adoption by the management of the economic units of a set of measures and the use of methods and techniques established on the basis of technical and economic calculations, which take into account new scientific findings.

Continuing vocational/ professional training and development represent the main self-capitalization and development way of the human factor, in order to capitalize better on the creative and anticipative human potential. This underlies the responsiveness and speed of adaptation to the new and the possibility of rapidly reintegrating the human

resources in other activities that are useful to the society. Labor material co-integration – it conditions the income of the population on their work results.

In this respect, it is very important to implement an apportionment system, which, on the one hand, determines as accurately as possible the size of each worker's salary, i.e., what is due for the work performed, and, on the other hand, a modern system of work norms whereby to determine the contribution of each person to social activity. Any neglect in this area is reflected unfavorably, sooner or later, in the sense of insufficient co-integration, when the incomes do not increase adequately according to the work performed, as in the case of higher revenues than the activity carried out, attracting the failure to observe a fundamental economic correlation, i.e. the increase in labor productivity and salary growth. It is widely accepted that, in order to have an efficient economic activity, productivity dynamics must be superior to salary dynamics.

Increasing labor productivity is of particular economic importance for the entrepreneur because:

- it creates the premises for reducing the total average (unitary) cost;
- it increases company competitiveness and its ability to cope with competition on the domestic and international market;
- it is possible to save the consumed production factors;
- it is possible for the owners of the production factors to obtain higher incomes when the produced goods are sold at the same prices or even lower, etc.

The effects of productivity growth are also felt at the consumers' level through:

- nominal salary growth;
- saving work time;
- increasing the satisfaction of needs, etc.

Productivity growth is also important for the national economy as a whole, because:

- more wealth is produced with the same volume of production factors;
- there is a mitigation of the tension between needs and resources;
- the population welfare increases;
- the national income per capita increases, etc.

The labor productivity level, among other factors, is a key element used for determining the salary level on categories of employees, observing the correlation between the dynamics of labor productivity and that of the average wage in the economy being essential in meeting efficiency-equity ratio in the economy (Ignat, 2004).

The theory of efficiency salary belongs to the American H. Leibenstein. The author starts from the idea that "individual productivity is an increasing function of the real wage (the number of goods that the employee gets). Therefore, an increase in salary attracts the increase in the direct cost of labor unit and labor productivity. On this basis, it is determined the efficient use of labor as work volume balanced with its productivity" (ASE, 1995).

"The return on labor capital-labor productivity expresses the efficiency with which labor is used, defined as the ratio between the amount of wealth produced and the number of resources absorbed during its production." (ASE, 1995).

The distribution of fundamental income in the economy – wages, profit, interest, annuity – must be correlated with labor productivity growth to avoid imbalances and dysfunctions in the economy.

It is very important that “labor productivity grows alongside the increase in employees’ wages, but this increase in wages must be, however, correlated with the personal contribution of each individual to labor productivity growth, wages not being able to increase faster than the rise in the newly created value” (Gheorghe, 1999).

We are among the leaders of Europe in terms of hours worked, but we earn among the lowest salaries on the continent. Employees in Romania work on average for almost 41 hours a week. Thus, we rank the 9th in the European Union in terms of the number of hours worked. For example, in one week, the Romanians work one hour more than the Spanish and about two hours more than the French or the Italians. It is also true that the Romanians work a little less than the British, who ranks first in this top.

Nevertheless, Romanians have among the lowest salaries in the European Union, i.e. 565 Euros per month, on average. Only Bulgarians earn less than we do, i.e. almost 460 Euros per month. Moreover, if we looked at the western states where people work less, we would notice that the net salaries are higher. Employees in Spain and Italy earn approximately 1,700 Euros per month and those in France and Germany earn over 2,200 Euros.

This phenomenon – as explained by specialists – is triggered by the fact that the Romanians work a lot but produce little. According to statistical data, labor productivity accounts for almost 62% of the European average. Even in this case, only the Bulgarians have lower productivity. On the other hand, in Western Europe, this indicator exceeds the European average.

Table 1. Labor productivity and revenues in the EU (Source: Eurostat)

Country	Hours worked per week	Average salary (euro)	Labor productivity (% of UE average)
Great Britain	42,3	1.990	101,1%
Poland	41,1	832	74,2%
Bulgaria	41	457	45,4%
Romania	40,7	565	61,6%
Germany	40,4	2.270	105,8%
Spain	39,9	1.749	101,9%
France	39,0	2.225	114,8%
Italy	38,8	1.758	107,4%

In the context of the recent economic monitoring at the EU level, the role of salary developments in influencing macroeconomic performance has attracted increasingly more attention. Salary changes represent one of the main channels of labor supply and demand adjustment and directly affect employment outcomes. Therefore, too high or too low salary growth (compared to productivity and rising prices) may indicate imbalances in the labor and product markets. This phenomenon can induce inflationary or deflationary pressures and may lead to a decrease or increase in the attractiveness of employing and retaining workers in the workforce. It can also affect job offers, including the decisions to participate in the labor market (European Commission, 2017).

Among the European countries, Romania has recorded the highest percentage increase of the minimum salary over the last 10 years, i.e. 195%. However, our salary level is still incomparably lower than the salary level in Western countries. Why does this happen?

According to KeysFin analysts, "The wages reflect, to a significant extent, the economic realities. Even if there is a significant economic growth, it comes largely from consumer spending thus not solid, sustainable in the long-term" (KeysFin, 2018).

The labor productivity in our country is still low, and companies avoid investing heavily in employees. By increasing salaries in the public sector, the state is trying to boost the market, but given the unstable economic framework, too few investors have followed this trend. In the absence of favorable investment conditions, such as infrastructure or the tax system, Romania remains attractive to investors, especially through low labor costs. In order to change this trend, macroeconomic policies are needed to support the horizontal development of investments. KeysFin analysts also explained that "only when the economy will not be that fragile will we see a real increase in Romanians' disposable incomes" (KeysFin, 2018).

Beyond the reality of 2018, the future of the labor market is quite bleak. The decline of the birth rate, the retirement of a whole generation of employees in the coming years and, in particular, the exodus of the labor force towards the West will cause Romania to face a growing labor force crisis in the coming years.

The education system, as it is currently set up, is completely useless in front of the challenges faced by the labor market. There are still being rolled out generations of unemployed graduates – i.e. with high school and university diplomas – that are not connected to economic realities", argued the experts.

According to them, the Romanian state needs to invest significantly in reorienting the educational system to the needs of the economy. "We need craft schools in all fields, from auto to agriculture, from materials processing to craftsmanship. It is also necessary to develop a real program of fiscal and financial support for firms that employ the young labor force. Without such measures, the crisis will deepen, and the alternative will be bringing workers from poor countries, from Africa and Asia, with inherent social consequences, as is the case in Germany", said KeysFin experts (KeysFin, 2018).

In this paper, we analyzed two indicators – the monthly gross average salary and the index of labor productivity per employee in the industry – to see if there is a connection between them and if labor productivity influenced the earnings.

The gross average salary represents (INSSE, 2017) "the ratio between the gross amounts paid to employees by economic units in the reference period, for whatever period it is due, and the average number of employees". In our case, we are interested in the industrial sector.

The ratios of labor productivity per employee in the industry are calculated according to the indexes of industrial production and the indexes of the average number of employees for the economic units with industrial activity (Sowell, 2007).

Statistical analysis of indicators

The statistical analysis of the economic indicators used in this study concentrated on the analysis of each indicator in terms of descriptive statistics and normality of the distribution. Then, we investigated the association between them. Q-Q plots were employed in order to visually analyze the distribution, but Kolmogorov-Smirnov tests were also considered in order to add significance to the study. Pearson correlation coefficient was computed to test the existence of the linear association between the two indicators. Based on the results, a linear regression model was calculated and the analysis of its residuals proved they are Gaussian white noise (Seskin, 2007).

The data series contains 145 monthly values recorded in the time interval January 2005 – January 2017, it was obtained from INSSE (2017). The statistical analysis was performed using SPSS (IBM Corp, 2013).

Based on the data from Tables 2 and 3, we calculated, for the two indicators, descriptive statistics – maximum, minimum, average, standard deviation, skewness coefficient, and kurtosis coefficient (see Table 4).

Table 2. Average gross monthly

Unit: Lei												
Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2005	835	819	877	923	913	921	941	954	968	939	971	1075
2006	952	944	1051	1048	1046	1059	1085	1098	1109	1101	1134	1254
2007	1129	1151	1274	1288	1267	1271	1321	1333	1319	1364	1375	1544
2008	1379	1385	1456	1626	1556	1583	1646	1598	1654	1627	1628	1836
2009	1615	1604	1688	1776	1704	1745	1820	1768	1802	1797	1796	1983
2010	1780	1775	1959	1867	1879	1905	1953	1932	1953	1915	1964	2180
2011	1945	1920	2044	2100	2022	2042	2077	2055	2064	2029	2094	2288
2012	2038	2021	2152	2208	2170	2147	2209	2155	2153	2160	2193	2389
2013	2111	2099	2221	2326	2260	2241	2326	2257	2262	2246	2308	2533
2014	2248	2240	2395	2445	2406	2389	2466	2375	2423	2394	2465	2720
2015	2409	2391	2563	2607	2536	2596	2637	2522	2573	2561	2663	2891
2016	2548	2556	2737	2831	2750	2807	2825	2777	2795	2774	2919	3144
2017	2891											

We notice that both have negative skewness coefficients, so there is some moderate skewness of the distribution. In terms of the kurtosis coefficient, we see that it is smaller than 0, thus the distribution has short tails (we call it 'light tailed'), without outliers. Since the values of these two indicators are moderate, we shall test the normality of the data using other complementary methods (Q-Q plot and the Kolmogorov-Smirnov test).

**(a)****(b)****Figure 1. Normal Q-Q Plot (a) and Detrended Normal Q-Q Plot (b) for ratios of labor productivity**

The graph Q-Q plot for productivity (Figure 1) index shows a seemingly normal character of the distribution, but a nonlinear trend of data is visually observed. The Kolmogorov-Smirnov test has the value $p < 0.05$ (0,047) - see Table 5, thus rejecting the hypothesis of data normality.

By visually analyzing the graph Q-Q of the variable monthly gross average salary it is seen that the data follows a normal distribution (all the points are close to the diagonal) (Figure 2). KS test obtains the p-value of 0.367, thus we conclude that there is no information which could lead to the rejection of the hypothesis that the distribution of salary is normal. Therefore, we can say that the monthly gross average salary is a normally distributed statistical variable.

Table 5. One-Sample Kolmogorov-Smirnov Test			
		ratios of labor productivity	gross average salary
N		145	145
Normal Parameters ^{a, b}	Mean	94.39	1909.80
	Std. Deviation	23.66	581.85
Most Extreme Differences	Absolute	.114	.076
	Positive	.075	.076
	Negative	-.114	-.072
Kolmogorov-Smirnov Z		1.370	.919
Asymp. Sig. (2-tailed)		.047	.367
a. Test distribution is Normal.			
b. Calculated from data.			

The histograms of the two indicators, accompanied by the normal curve, also show some deviation of the data from normality. The productivity ratio has a multi-modal distribution (analyzing the shape of the histogram) (see Figures 3 and 4).

Figure 3. Evolution of ratios of labor productivity

Figure 4. Evolution of gross average salary

For the analysis of the linear association between the two variables, we calculate the correlation coefficients. The calculated correlation coefficients reveal that the two variables are closely correlated. Pearson correlation coefficient is 0.922- see Table 6, which indicates a very close linear association between the two variables (the associated p-value is smaller than 0.01, so the coefficient is also statistically significant).

Table 6. Correlations

		Ratio of labor productivity	Monthly gross average salary
Ratio of labor productivity	Pearson Correlation	1	.922**
	Sig. (1-tailed)		.000
	N	145	145
Monthly gross average salary	Pearson Correlation	.922**	1
	Sig. (1-tailed)	.000	
	N	145	145
**. Correlation is significant at the 0.01 level (1-tailed).			

Given the documented association of the two continuous variables and that there are no significant outliers, we built the linear regression model which explains the salary based on the productivity index – see Table 7.

Table 7. Correlations^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-230.240	77.458		-2.972	.003
	Ratio of labor productivity	22.672	.796	.922	28.477	.000
a. Dependent Variable: Monthly gross average salary						

Thus, the model is: $-230.24 + 22.67 \cdot \text{index} = \text{salary}$

The Anova table characterizes the linear regression model. The significance level is <0.01 , thus, the regression model is statistically significant to predict the salary on the basis of productivity index – see Table 8.

Table 8. ANOVA^b

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	4.144E7	1	4.144E7	810.960	.000 ^a
	Residual	7308096.025	143	51105.567		
	Total	4.875E7	144			
a. Predictors: (Constant), Ratio of labor productivity						
b. Dependent Variable: Monthly gross average salary						

The residuals of the linear regression model follow a normal distribution – see Table 9 and Figure 5. This is important in order to have a well fit model.

Table 9. Residual Statistics^a

	Minimum	Maximum	Mean	Std. Deviation	N
Predicted Value	871.62	2760.20	1909.80	536.47	145
Residual	-468.86	853.10	.00	225.27	145
Std. Predicted Value	-1.93	1.58	.00	1.00	145
Std. Residual	-2.07	3.77	.00	.99	145
Dependent Variable: Monthly gross average salary					

Figure 5. – Regression Standardized Residual (Dependent Variable: Monthly gross average salary)

Conclusions

Gross average earnings and the labor productivity index were analyzed over a period of 145 months, between January 2005 and January 2017. The two variables were found to be strongly correlated, with a strong linear association. A linear regression model was built to model the evolution of the gross average salary in the industrial sector as a function of the labor productivity index in this sector. The industrial sector helped prevent the emergence of imbalances and dysfunctions in the economy by respecting these fundamental correlations between the gross average earnings and the labor productivity index.

THE IMPACT OF FISCAL AND MONETARY POLICY ON INFLATION: AN EMPIRICAL STUDY RELATED TO ROMANIA

Ramona-Mihaela BÂZGAN

*The Bucharest University of Economic Studies
6 Piata Romana, 1st district, Bucharest, Romania
bazgan.ramona.mihaela@gmail.com*

Abstract. *The study would develop an econometric Vector Error Correction Model (VECM model) that would determine the impact of fiscal policy and monetary policy on the evolution of inflation rate. There were used quarterly time series data over the period of 2007 (1st quarter) – 2017 (4th quarter) on the case of Romania. In order to explain the impact of fiscal policy and monetary policy on the evolution of inflation rate, the econometric model involved endogenous variables such as the growth rate of the money supply, the rate of change in the inflation rate and the rate of change in the public budgetary balance. Furthermore, the analyzed econometric model was used to forecast over a period of $t+4$ (4 quarters) the evolution of the variable budgetary balance along with the evolution of money supply using as an exogenous variable the annual target value computed by the central bank for the inflation rate. Thus a positive impulse or a negative impulse in the value of the rate of inflation could explain any influence on the value of money supply or the value of budgetary balance. The Granger causality test applied to the VECM model revealed a unidirectional causality form between the variable budgetary balance to the variable rate of inflation and from the variable inflation to the endogenous variable represented by the value of money supply. This revealed that an increase in the level of budgetary balance would be computed in an increase in the level of the inflation rate. Moreover, an increase in the rate of inflation would lead to an increase in the value of money supply according to the results generated on time series data taken into consideration over the analyzed period. The VECM model revealed under the variance decomposition that the fiscal policy such as the evolution of public revenues and of public spending would have a significant impact on inflation. On the other hand, monetary policy tended not to have a significant impact on the evolution of inflation over the analyzed period of time.*

Keywords: *fiscal policy; monetary policy; inflation; money supply; Vector Error Correction Model; forecast; Granger causality test.*

Introduction

Fiscal and monetary policies would generate an impact on the evolution of macroeconomic indicators. Fiscal policy could influence macroeconomic variables through each type of tax implemented by the state in order to generate higher public revenues or by implementing different values in the distribution of public revenues to public spending. Monetary policies could generate higher or lower money supply in the entire economy of a state that would further influence the level of interest rates and the level of inflation rate along with the market price levels which could further impact other macroeconomic indicators such as consumption, investment level, unemployment rate. Types of fiscal and monetary policies applied by the state in terms of inflation rate fluctuations have a significant impact on the entire development of the economy.

The first part of the article presents the recent specialty literature which involves econometric models that revealed the relationship between fiscal and monetary policy and their implications on inflation. The second part involves the methodology, namely the estimation of the econometric Vector Error Correction Model (VECM) with the chosen endogenous variables such as the variation of the inflation rate, the variance on the budgetary balance, the rate of change in the money supply. Fiscal policies would be generated in this study by analyzing trends in public spending and public revenues and their subtraction under the value of budgetary balance. Monetary policy would be reflected by analyzing the evolution of money supply generated in the market. The level of prices on the market will be reflected in this study by analyzing the evolution of the inflation rate.

The last part involves the conclusion consisting in forecasting the values of the endogenous variables chosen in the econometric model using as exogenous variable the annual target rate for inflation revealed on the statistical data published by the central bank.

Literature review

The impact of fiscal and monetary policy on inflation has been analyzed on several recent econometric studies. Boiciuc (2015) analyzed a Vector Autoregressive Model in order to explain the impact of fiscal policy on the main macroeconomic variables such as gross domestic product, inflation, interest rate, employment. The impact of fiscal shocks on macroeconomic variables related to Romania over the period of 2000:1 – 2012:4 was revealed not to be so significant. The variables used in order to compute the Vector Autoregressive Model were real output, inflation, interest rate, government expenditure, tax revenues.

Agbonlahor (2014) analyzed a Vector Error Correction Model on time series related to United Kingdom over the period of 1940-2012. The econometrical model revealed the impact of monetary policy on economic growth. The study revealed a long-term relationship between these variables. Inflation rate and money supply seemed to be significant to the evolution of economic growth.

Georgantopoulos and Tsamis (2011) analyzed a Variance Correction Model in order to develop the causality between budget deficit, consumer price index, gross domestic product and nominal effective exchange rate related to Greece over the period of 1980-2009. Empirical evidence revealed a cointegration between the chosen variables among with one-way causalities from effective exchange rate to budget deficit and from budget deficit to gross domestic product. It was also revealed a bidirectional causality link between effective exchange rate and consumer price index. The study disclosed no significance link between budget deficit and inflation in case of Greece.

Giordano, Momigliano, Neri and Perotti (2007) analyzed a Vector Autoregressive Model in order to study the effects of fiscal policy on private gross domestic product, on inflation and on the long interest rates using time series data related to Italy over the period of 1982:1 to 2004:4. Regarding the inflation, it was revealed that the response of inflation to fiscal policy has a small and short-term impact.

Cheung, K.I. and Cheung, L. (1993) applied the J-test to a IS-LM model consisting using as variables the rate of change in inflation rate, the rate of change in government tax revenue, the rate of change in government spending, the rate of change in money supply for Australia over the period of 1961-1990. Empirical findings revealed no significant impact of money supply on inflation. Fiscal policy revealed to be significant in explaining the level of inflation and unemployment.

Methodology

The econometric model chosen for this study would explain the impact of fiscal and monetary policy on the inflation rate. The study used quarterly statistical time series related to Romania for the period from 2007 (1st quarter) to 2017 (4th quarter). Time series were generated by using the Eurostat database and the data provided by the National Bank of Romania reports.

Figure 1. Evolution of the rate of inflation – Romania on the period of 2007-2017

As it can be displayed on Figure 1, the inflation rate recorded a downward slope from 2008 to 2016 – 2nd quarter, when it was registered a deflation rate of 2.63 percent. Before the year 2016, the value of inflation rate began to increase, the slope started to register an ascending trend and is maintaining this trend up to 2018.

Figure 2. Evolution in the level of public revenues and public expenditure – Romania - 2007-2017

There is an upward slope in terms of public revenue and government spending. According to Figure 2, the tendency is that public expenditure overcomes the level of public revenue over the analyzed period, registering in this way a deficit in the value of budgetary balance.

Figure 3. Evolution in the level of money supply – Romania – 2007-2017

The chosen econometric model comprises as endogenous variables the rate of change in inflation, the rate of change in the budget deficit, the rate of increase in the money supply on the Romanian market. The econometric model was developed using 44 observations with quarterly frequency, respectively 2007(1st quarter) - 2017(4th quarter). The econometric model was implemented using Eviews software.

Table 1. Notations of the endogenous variables used in the VECM model
(Source: author's own research)

The name of the variable	Notations
Rate of change in inflation (%)	inflation
Rate of variance in budgetary balance(%)	budgetary balance
Rate of growth in money supply (%)	money supply

In order to reveal the influence of fiscal policy and monetary policy on inflation rate, the chosen econometric model chosen would be represented by the following equation:

$$\text{inflation}_{1t} = \alpha + \beta_1 \text{inflation}_{t-1} + \beta_2 \text{inflation}_{t-2} + \dots + \beta_z \text{inflation}_{t-z} + \gamma_1 \text{budgetary\_balance}_{t-1} + \gamma_2 \text{budgetary\_balance}_{t-2} + \dots + \gamma_z \text{budgetary\_balance}_{t-z} + \delta_1 \text{money\_supply}_{t-1} + \delta_2 \text{money\_supply}_{t-2} + \dots + \delta_z \text{money\_supply}_{t-z} + \varepsilon_t \quad (1)$$

Where:

- β, γ, δ represents the coefficients that could significantly have an impact on the inflation rate;
- budgetary balance, inflation and money supply represent the endogenous variables used for the Vector Error Correction model;
- ε_t represents the error term;
- z represents a notation that refers to the fact that time series start from z and end up to a p number of lags.

Regarding the stationarity of the time series values, as shown in the values displayed on Table 2, inflation and budgetary_balance would be stationary at level, respectively integrated at grade I(0). In terms of time series generated for money_supply variable, t-static at first difference is -9.89 while p-value is 0.00 and the critical value is equal to -4.20. Because the probability is less than 5%, we will consider money_supply variable integrated of order one I(1). The step of evaluating the stationarity for the chosen variables was implemented in order to deseasonalized and remove any trend or shock

in the evolution of the time series which would further be necesarrelly in the prediction of the future values of the chosen time series.

Table 2. Augmented Dickey-Fuller test
(Source: author's own research using Eviews software)

Unit root test at level		Intercept			Trend with intercept		
		P-value	T-static	Critical value	P-value	T-static	Critical value
Variable	inflation	0.0000	-6.97	-3.59*	0.0000	-6.95	-4.19*
	budgetary_ balance	0.0000	-6.37	-3.59*	0.0000	-6.70	-3.59*
	money supply	0.9773	0.3346	-3.60*	0.9906	-0.20	-4.20*

Asterisk * denotes statistically significant values at 1% level.

Table 3. Lag Length Selection Criteria
(Source: author's own research using Eviews software)

Lag	LogL	Sequential modified LR test statistic	Final prediction Error	Akaike Information Criterion (AIC)	Schwarz Information Criterion (SC)	Hannan-Quinn information Criterion (HQ)
0	-97.54071	na	0.039876	5.291616	5.420899	5.337614
1	-80.82670	29.90928	0.026631	4.885616	5.402748	5.069608
2	-68.21455	20.57773	0.022251	4.695502	5.600484	5.017488
3	-52.38657	23.32544	0.015932	4.336135	5.628966	4.796115
4	-31.21341	27.85942*	0.008809*	3.695442*	5.376123*	4.293416*
5	-26.26172	5.733528	0.011824	3.908512	5.977042	4.644479
6	-14.12528	12.13644	0.011398	3.743436	6.199815	4.617397

As shown in Table 3, p number of lags that would be included in the prediction and in the deduction of the causality between the chosen endogenous variables would consist in a number of 4 lags. As seen in Table 3, the lag length criteria would consist in choosing the minimal values computed for Akaike Information Criterion and Schwarz Information Criterion.

Table 4. Cointegration Rank Test
(Source: author's own research using Eviews software)

Number of cointegrating vectors	Eigenvalue	Trace Statistic	0.05 Critical value	Probability
None*	0.474453	40.51658	24.27596	0.0002
<=1*	0.235145	13.49731	12.32090	0.0316
<=2	0.051901	2.238438	4.129906	0.1588

As displayed in Table 4, the Cointegration Rank Test indicated 2 cointegrating number of vectors at the 0.05 level due to the p-value which is higher than 5%. The evidence of existing of vectors at the 0.05 level shows a long-run relationship between the chosen endogenous variables. Thus, a Vector Error Correction model would be implemented using as endogenous variables such as inflation, money supply and budgetary balance.

Table 5. The results of the VECM Model
(Source: author's own research using Eviews software)

Variable	Coefficient	Standard Error	t-Statistic	Probability
CointEq1	-0.118712	0.33826	2.80684	
D(budgetary_balance(-1))	-0.120158	0.02114	-5.68485	0.1231
D(budgetary_balance(-2))	-0.032917	0.02313	-1.42331	0.8758
D(budgetary_balance(-3))	0.004894	0.04365	0.11212	0.5228
D(budgetary_balance(-4))	-0.028214	0.03162	-0.89235	0.5487
D(inflation(-1))	0.246130	0.246130	1.16245	0.5023
D(inflation(-2))	0.424070	0.15574	2.72287	0.0282
D(inflation(-3))	-0.22736	0.31091	-0.73129	0.5780
D(inflation(-4))	-0.48646	0.20788	-2.34008	0.9166
D(money_supply(-1))	3.904774	3.49622	1.11686	0.3807
D(money_supply(-2))	4.946580	3.39689	1.45621	0.7028
D(money_supply(-3))	-4.253700	6.99637	-0.60799	0.3894
D(money_supply(-4))	-4.357590	6.40185	-0.68068	0.4717
c	0.60898	0.13028	0.46742	0.0276
R-squared	0.821108			
Adjusted R-squared	0.728084			
F-statistic	8.826862			

By implementing the VECM Model, the results showed that 82.11% in the evolution of inflation would be explain by the evolution of money supply and of the budgetary balance.

Table 6. Serial LM Test
(Source: author's own research using Eviews software)

Lags	LM-Stat	Probability
1	19.0	0.0247
2	14.1	0.1164
3	5.57	0.7812
4	9.14	0.4236

According to *Table 6*, by implementing Serial LM Test and Heteroskedasticity Test, the validity of VECM model was approved due to the probability which registered a level higher than 5%.

Results displayed on *Table 7* indicate a unidirectional causality from budgetary balance to inflation variable and from budgetary balance to money supply due to the value of probability less than 5%. This indicates that any increase in the level of budgetary balance would consist in an increase in the level of inflation rate and money supply. Furthermore, due to the p-value generated of less than 5%, an increase in the rate of inflation would lead in an increase in money supply according to the results generated on time series used on Romania. As a consequence, it was generated that any change in budgetary balance could have a further impact on the forecast of the values of money supply and of the inflation. Due to the fact that no bidirectional causality was released, the contrary could not be explained on the case of Romania.

Table 7. Granger Causality Test
(Source: author's own research using Eviews software)

Null Hypothesis	Obs	F-Statistic	Probability
Inflation does not Granger Cause budgetary_balance	40	2.86068	0.0398
Budgetary_balance does not Granger Cause Inflation		5.92965	0.0012
Money_supply does not Granger Cause Budgetary_balance	40	1.88229	0.1385
Budgetary_balance does not Granger Cause Money_supply		6.27470	0.0008
Money_supply does not Granger Cause Inflation Inflation does not Granger Cause Money_supply	40	4.03130	0.0096
		1.21858	0.3230

Source: author's own research using Eviews software.

According to data displayed in *Table 8*, the variance of inflation is explained at about 38.1% by the evolution of budgetary balance while money supply seemed to have an insignificant influence of only 3.84% at period 10 when explaining the variance of inflation.

Table 8. Variance decomposition
(Source: author's own research using Eviews software)

Variance Period	S.E.	Money supply	Budgetary balance	Inflation
1	0.774973	0.237526	10.86440	88.89807
2	0.778206	0.236928	11.20895	88.55412
3	1.007510	0.836379	35.93789	63.22573
4	1.074887	3.393001	32.52943	64.07756
5	1.078873	3.439681	32.37753	64.18279
6	1.119804	3.243895	30.41560	66.33990
7	1.165756	3.972310	28.40518	67.62251
8	1.319639	3.458759	37.18038	59.36086
9	1.338833	3.846348	37.43903	58.71463
10	1.348905	3.846561	38.10182	58.05162

After the development of the causality forms generated between the variables, a forecast of the values of budgetary balance and money supply was implemented over a period of t+4 (4 quarters). The inflation was used as exogenous variable as it was generated in the reports retrieved from the National Bank of Romania reports. Due to the fact that on the first quarter of 2018 the inflation rate in Romania was approximately 0.5% higher than it was on the 4th quarter of 2017, on the first scenario of forecast (Baseline) we assume that the inflation rate on the first quarter of 2018 was higher with 0.5% than the previous quarter and furthermore in order to reach the annual target value computed for inflation rate by the central bank, we assumed that the inflation rate would decrease each quarter with 0.5% than the previous quarter until the 4th quarter of 2018.

Table 9. Generating scenarios in order to predict the evolution of variables
(Source: author's own research using EvIEWS software)

Forecasted periods	Baseline - scenario		
t = 2017(q4)	Budgetary_ balance	Inflation (%variation)	Money_ supply
t+1 (q1)	13.14424	+0.5	0.11
t+2 (q2)	4.401088	-0.5	0.11
t+3 (q3)	5.239381	-0.5	0.06
t+4 (q4)	4.962510	-0.5	0.07

Source: author's own research using EvIEWS software.

The results of the econometric model presented in *Table 9* represent the forecasted values of budgetary balance and money supply using as exogenous value the annual target value for the inflation rate. In case of decreasing the level of inflation rate with 0.5 percent each quarter as the previous quarter over the period of 2018: 2nd quarter – 2018 :4th quarter, the budgetary balance would increase with 4.96 percent in the last quarter of 2018, while for the value of money supply the increase would not be so significant, namely 0.07 percent.

Conclusion

The main object of this study was to reveal the impact of fiscal policy and monetary policy on the evolution of inflation. The empirical study explained the causality and variance between budgetary balance, inflation rate and money supply over the period of 2007 (1st quarter) – 2017 (4th quarter) on the case of Romania. These macroeconomic variables are significant for the improvement of any policy and strategy implemented by each state in order to stabilize the level of prices on the market. In order to adjust the effects of a high inflation, public authorities should implement sustainable monetary and fiscal policies. Empirical studies have revealed that any increase in the level of prices could be adjusted by public authorities by implementing new policies on the system of taxation or in the components of public spending. Most empirical findings revealed that increasing taxes would lead to a decrease in the level of disposable income which further contributes to a decrease in consumption and further on with consequences on inflation rate.

In case of Romania, the VECM model implemented revealed the existence of cointegrating number of vectors between the endogenous variables inflation rate, money supply and budgetary balance. Due to this fact, a long-run relationship could be developed and explained when taking into consideration the endogenous variables used on the development of the analyzed VECM model. The results of the economic model revealed that 82.11% in the evolution of inflation could be explained by the evolution in time of variable money supply or of the variable budgetary balance. The variance decomposition of 10 periods determined the fact that the variance of inflation rate could be explained at a maximum level of 38.10% while the money supply had an insignificant influence of only 3.97% at the period 7. As a consequence of implementing this model on the case of Romania, it was revealed that budgetary balance has a higher impact on the evolution of inflation rate than the evolution of money supply. Furthermore, the Granger Causality test revealed unidirectional causality forms from budgetary balance to inflation, from budgetary balance to money supply and from money supply to inflation. This indicated that any increase in the level of budgetary balance would consist in an increase in the level of inflation rate and of money supply. No bidirectional

causality form was released on the analyzed VECM model. Using scenarios on the analyzed VECM model, it was generated that in case of a prediction of the budgetary balance and money supply assuming that the inflation rate would decrease with 0.5% each predicted quarter, the budgetary balance and money supply would increase. The increase would be more significant in case of budgetary balance than in case of money supply. The results of the analyzed VECM model revealed that the inflationary tendency from the last years could be removed by implementing sustainable fiscal policies than to adjust the level of money supply.

REGIONAL DEVELOPMENT OF THE WESTERN BALKANS MAY NOT BE ESSENTIAL IN THE EU ACCESSION PROCESS

Tomasz GRODZICKI

Nicolaus Copernicus University
Jurija Gagarina 13a, 87-100 Toruń, Poland
tomgro10@wp.pl, tg@doktorant.umk.pl

Abstract. *Regional development is a widely debated topic, not only in the EU but also in the Western Balkan countries: Albania, Bosnia and Hercegovina, the former Yugoslav Republic of Macedonia, Kosovo, Montenegro, and Serbia. Majority of these countries have still felt the effects of the Yugoslav Wars so that their growth path is limited. Nowadays, the Western Balkan countries are aiming to be a member of the European Union. However, the accession path is considered to be a long and tough process with a number of criteria to be met. Many researchers suggest that regional development should be considered as one of the first issues to be addressed in the EU Accession Process. However, this paper takes the position that while regional development is indeed of great importance, it need not be a requirement to join the EU. The paper suggests that these countries should focus on meeting different EU accession criteria in the first place. Then once they become an EU member, they will have time and all necessary funds and financial aids to comply with regional development. The paper is based on a critical and synthetic literature review on the problem of regional development of the Western Balkans and in the perspective of the potential EU enlargement. It clearly addresses the issue of whether the Western Balkans should focus on the regional development and once it is achieved, the EU accession will come naturally. Many researchers think in that way, however, it seems that such a process might be time-consuming, so instead of focusing on regional development, the WBs countries need to focus on their economic, institutional, legal and political environment to speed up the EU integration process.*

Keywords: *regional development; Western Balkans (WBs); regional integration; EU accession, Yugoslavia.*

Introduction

The term Western Balkans (WBs) is designed for a group of countries in Southeastern Europe which are not yet EU member states. This group consists of the following countries: Albania, Bosnia, and Hercegovina (BiH), the Former Yugoslav Republic of Macedonia (FYROM), Kosovo, Montenegro, and Serbia. Except for Kosovo and BiH which are the potential EU candidates, they are all the EU candidate countries.

Regional development is crucial for the EU member states, which are supported by the European Regional Development Fund (ERDF) to help underdeveloped regions grow. However, the WBs are not the EU members so the ERDF does not apply to them. Considering economic integration, Bartlett (2008) rightly observes that the WBs are diverging not only in economic growth but also in living standards. As a reason for that, he blames trade liberalization that imposed deeper deindustrialization. There are a number of research papers and reports that clearly indicate that the WBs should develop regional integration further, as they are a new candidate or potential candidates

countries. This paper argues that there is no need to do so in the first place as they all still face their internal problems like high unemployment rate, high level of corruption, issues with the rule of law, etc. They are all placed in the specific EU chapters that have to be closed before a country accesses the EU. The time for regional development will come when the country becomes an EU member, as then it will receive EU funds and financial aids to address this issue. This paper takes the position that regional development in the WBs is not necessarily required for EU accession. Nevertheless, it is indeed a tremendous asset to have when applying for the EU membership. However, due to its complex nature involving money and proper functioning institutions, the WBs may face serious difficulties in achieving it without the substantial financial help from the EU. Instead, the paper argues that there should be the following order: at first, a country should join the EU and then (with help of the ERDF) develop its regions. Alternatively, this paper suggests the WBs to work on their institutions which are not efficient (Efendic & Pugh, 2015). Better functioning institutions have their positive impact on regional development (Rodríguez-Pose, 2013).

Firstly, this paper considers the necessary information on the economic overview of the WBs' economy. Then, it describes the role of regional development and institutions. Furthermore, it focuses on the regional perspective of the EU accession by the WBs. Then, this paper points out why regional development is not a necessary step in the EU accession. In the last section, it concludes.

Research methodology

This paper clearly addresses the issue of European Integration for the WBs from the perspective of regional development. The paper starts with the economic overview of the WBs' economy so it contains data on the past, current at the future economic situation. Further on, this paper mainly focuses on the problem of regional development and the question whether it should be a first step towards the EU integration of the WBs or not. In order to proceed with such an analysis, it should be mentioned that such a complex issue that is related to economic and political perspectives, seems to be unsolvable from the quantitative analysis because it would be difficult to build a model that contains all factors. It could be even more difficult to comment on the result and draw a reasonable conclusion. Therefore, this paper takes the descriptive approach and formulates the problem based on the literature on this topic. A critical review of the literature and its synthesis makes this paper clear and comprehensive.

The economic overview of the Western Balkans' economy

Almost all of the Western Balkans countries, except for Albania, used to form in the past a country of Yugoslavia. Uvalic and Cvijanović (2017) indicate that in the case of the former Yugoslavia, three phases of economic development can be distinguished, starting from 1989. The first period is the 1990s that can be described by the high political and economic instability, intensified conflicts, sanctions and, consequently, the breakup of Yugoslavia. Not without reason, this period is often referred to as "lost decade", integration with the EU (Hayoz, Jesien & van Meurs, 2005). The second period started from 2001 and lasted until 2008 that was the beginning of the integration with the EU characterized by the acceleration of economic reforms, a period of rapid economic growth based mainly on growing dependence on foreign capital (foreign direct investment), a credit boom, accumulation of structural problems. However, this phase

was interrupted by the global financial and economic crisis. Last period started in 2009, with the recession and a much lower rate of economic growth and even a negative result of economic growth.

A comprehensive analysis of the economic growth of the countries of former Yugoslavia is difficult because some of the currently existing countries have changed over the years. An extreme example is then Serbia, which has changed five times to the present. In the years 1945-1991 it was the Socialist Federal Republic of Yugoslavia, then in the years 1992-2003 the Federal Republic of Yugoslavia. Then, today's Serbia in 2003 - 2006 functioned as the Union of Serbia and Montenegro, in 2006. declare independence, and finally in 2008. Kosovo separated from it, despite the fact that Serbia still does not recognize this fact until today. Therefore, it is legitimate to ask which countries or groups of countries should be analyzed and where to get the data that could be compared.

Another problem is the availability of data. Data from the World Bank are not collected for countries that no longer exist, in this case for Yugoslavia. Eurostat for these countries only leads the latest statistics, but not for each country. Until recently, there was only one database, which had statistics for the countries of former Yugoslavia, unfortunately only available until 2010 (Uvalic, 2018). However, it has recently been updated until 2016 inclusive. Thus, the figure below shows the real GDP per capita in Yugoslavia and the countries that emerged after its collapse.

Yugoslavia was a rapidly growing economy at the time, and the records of increases up to the 1980s were impressive (Kukić, 2017). It should also be added that Yugoslavia was also a well-placed country in the international arena. This is evidenced by the Yugoslavian passport, which at that time was one of the "best" in the world because it enabled traveling both to the East and the West (Dijk, 2008, p.898). Unfortunately, in the 1990s, due to conflicts and political disputes that led to the breakup of Yugoslavia, the economies of the former Yugoslavia countries recorded a relatively high drop in GDP per capita.

One of the most common goals of each country in the world is to enter the path of long-term economic growth. It also applies to the countries of former Yugoslavia. In order to be able to refer to their current economic situation, one should look at the path of economic growth of these countries.

Figure 1 shows GDP per capita in the Western Balkans. It is worth noting that all the countries of the former Yugoslavia and each state separately characterize a similar trend of changes in GDP per capita over the years. At the beginning of the analyzed period, the republic with the highest GDP per capita was Montenegro, followed by Croatia, Serbia, Yugoslavia, Macedonia, Albania, and BiH respectively. The economic growth of all republics and total Yugoslavia to the early 1980s was impressive. Then, as a result of intensifying conflicts, stagnation took place. At the beginning of the breakup of Yugoslavia, in 1991, at the top of ranking this time Montenegro followed by Croatia, and then respectively: Serbia, Macedonia, Yugoslavia, BiH, and Albania. In addition to political tensions, there were also disproportions in economic growth in these republics. After a sharp drop in GDP per capita in all the republics at the beginning of the 1990s, these countries slowly began to rebuild their economies. This was not without temporary fluctuations (declines in GDP per capita) such as the second half of the 1990s

or 2008 when the global financial crisis took place. At the end of the analyzed period, disproportions among the leading countries in the GDP per capita ratio have widened. The country that is leading is Croatia and then: Montenegro, Yugoslavia (if it still existed), Serbia, Macedonia, Albania, and BiH.

Figure 1. Real GDP per capita in 2011US \$ in the Western Balkans countries for the period 1952 - 2016, benchmark 2011
(Own elaboration based on Maddison database, Bolt et al., 2018)

Table 1. Real GDP growth in the WBs, in a percentage scale for the period 2016-2019 (own elaboration based on the World Bank, 2018, p.9)

	2016	2017*	2018*	2019*
Albania	3,4	3,8	3,6	3,5
BiH	3,1	3	3,2	3,4
Kosovo	4,1	4,4	4,8	4,8
FYROM	2,9	0	2,3	2,7
Monenegro	2,9	4,3	2,8	2,5
Serbia	2,8	1,9	3	3,5
WB	3,1	2,4	3,2	3,5

Note: * estimated and forecasted data

As it is indicated in table 1, GDP growth in the Western Balkans decelerated from 3.1 percent in 2016 to an estimated 2.4 percent in 2017. Regional growth slowed in Serbia due to the severe winter and stopped in FYROM, where the political crisis discouraged both public and private investments. BiH noticed a similar growth as in the last two years. The dynamics of the smaller economic actors of WBs: Albania, Kosovo and Montenegro contributed to the regional increase in 2017, with the support of the higher growth of trade partners, increased prices of goods and the implementation of large investment projects (World Bank, 2018).

Although the increase in the number of jobs was slower than in 2016, it is noticeable that around 190,000 new jobs were created in the first nine months of 2017 in the

region. Professional activity was at a higher level in most countries because more people successfully entered the labor market. In addition, over 80 percent of new jobs concerned services, mainly retail and wholesale, supported by increased consumption. Although the level of unemployment declined in most countries, it still varies from 13.5 percent in Serbia to 30.4 percent in Kosovo. The level of poverty continued to decrease, in spite of rising food and energy prices. Albeit revenues increased in general, not all of the WB countries benefited from the possibility of reducing budget deficits. Only two countries managed to achieve surpluses in 2017, which are: Serbia and BiH; while all the others recorded deficits caused by a high level of recurrent expenditure, often due to poorly targeted social benefits and subsidies. Three WB countries: Albania, Montenegro, and Kosovo are currently working on reviving capital investments to boost economic growth. As it is advised, careful financial, public and budgetary management will help minimize fiscal risks associated with investments, which should ease the pressure on medium-term debt service capacity. Regional GDP growth is forecasted to increase from 2.4 percent in 2017 to 3.2 percent in 2018 and 3.5 percent in 2019. The WB countries are estimated to grow faster, supported by expected growth in Europe with the exception of Albania and Montenegro. There are the following threats for the WBs to be considered: trade protectionism, interest rate normalization on a global scale, low growth and uncertainty as to internal policy (World Bank, 2018).

The role of institutions in regional development

The reason the term regional development exists is that there are economic disparities between regions. The ERDF was created in order to address this issue and to make the chances of all regions equal by reducing economic disparities among regions. Brühlhart and Koenig (2006), empirically proved that border regions and capital regions are on higher development levels than the others. This is due to the following reasons: better access to the market, favorable initial conditions, and better economic environment to attract FDI. In order to foster regional development, the EU has its Cohesion Policy and Structural Funds.

The natural question then is if there are other options to improve regional development. Those can potentially be found in the New Institutional Economics (NIE) which may be helpful to address regional development for the WBs countries that do not receive such financial aids as EU member states. The approach towards the role of institutions in economic development had changed with the implementation of the NIE which considers institutions to be a crucial factor for economic development. The NIE was introduced by Coase, North and Williamson who originated the way of thinking about institutions as a key concept in expounding differences in performance among industries, nations, and regions (Brousseau & Glachant, 2008). Rodríguez-Pose (2013), however, goes one step further and asks whether institutions matter for regional development. He admits that policymakers would not have thought of this question until the 1990s because the institutions were not perceived as causing problems. His research clearly indicates that institutions play a significant role in regional development. When functioning properly, they cannot be overestimated in contributing to the economic growth in regions. However, the extent to which they impact the regional development still remains unknown. Albeit that he states that institutions are vital for economic development in regions, he does not provide ready-to-implement solutions on how institutional reforms should be undertaken. Instead, he underlines that there is no 'one-size fits all' policy and the key point is to properly define institutions and the way to measure them. That, however, is not an easy task.

Western Balkans on their way towards the EU integration: regional perspective

Regional cooperation was of great importance for the Western Balkans since it created a ground for peace and democracy as well as taken away potential conflicts (Erler, 2004, p.11). There were numerous regional initiatives in the Western Balkans undertaken in the period of 2001-2008 such as: Energy Community, European Common Aviation Area Agreement, South East Europe Transport Observatory, CEFTA and Bilateral Free Trade Agreements, Stability Pact for SEE, European Charter for Small Enterprises, Investment Compact, Electronic Southeast Europe Initiative, and Stability Pact for South East Europe that contributed to the removal of Non-Tariff Barriers initiative (Qorraj, 2018).

According to Bieber and Kmezić (2016, p.2), there is “optimism” for the WBs since the EU integration is considered to be the main driving force for change in the level of democracy and potential reforms.

There have been a number of programmes and funds directed to the Western Balkans. They aimed to improve the economic and financial situation to foster regional competitiveness. These programmes: CARDS 2000-2006, IPA 2007-2013 RSED2, IPA II 2014-2020, were designed to fully make use socio-economic, cultural and historical potentials for the WBs (Tošović-Stevanović & Ristanović, 2016).

In order to become an EU member state, a country needs to meet certain criteria which are officially called *acquis communautaire* (EU *acquis*) and are divided into specific chapters. In the 5th EU Enlargement, there were 31 chapters, and during the current 6th one, there are 35 chapters which have to be first opened and then closed. This means that a candidate country needs to work on 35 different matters, such as customs union, free movement of goods, energy, environment, taxation, etc. They need to comply with the requirements of each chapter and it is essential that they will close the chapter, which means they will manage to fulfill all necessary points from the checklist. The most advanced country from the WBs in this process is Montenegro with 28 chapters opened and 3 closed, then Serbia with 10 and 2, respectively (European Commission, 2017). Both Albania and FYROM have no chapters being opened, and remaining BiH and Kosovo are potential candidate countries so they have not even started the process yet.

Chapter 22 of the EU *acquis* entitled: “Regional policy and coordination of structural instruments” clearly states what needs to be done in terms of regional policy:

The acquis under this chapter consists mostly of the framework and implementing regulations, which do not require transposition into national legislation. . . .

The Member States must have an institutional framework in place and adequate administrative capacity to ensure programming, implementation, monitoring, and evaluation in a sound and cost-effective manner from the point of view of management and financial control. (European Commission, n.d.)

However, neither regional economic integration nor regional development was mentioned. There is only an emphasis put on institutions that should be able to transfer funds, (e.g. from the EU Cohesion Policy) to regions. Every candidate state does receive pre-accession funds, however, not as much as the funds for the EU member states, which access the ERDF.

Regional development as a (un)important element of the EU accession process

As Seroka (2008) rightly notices, one of the most prominent reasons why the EU wants the WBs to be integrated is to ensure security, political stability, and economic prosperity. He also admits that the EU accession conditions are set at a higher level for the WBs compared to the 2004 EU Enlargement. The underlying idea of promoting regional integration is to ensure that the WBs will focus on cooperation instead of going into potentially long-term conflicts or political disputes, which could eventually lead to the war. Therefore, in order to avoid the latter issues, it is very convenient for the EU to ask the WBs to deal with the problem of regional integration before joining the EU. In this way, the EU is not obliged to financially support this process, which normally would have to be supported if a country is an EU member state.

According to Sklias and Tsampra (2013), regional integration in the WBs is still not developed, so it negatively affects the socio-economic situation in these countries. This is indeed true, but we argue that not being a part of the EU is negatively affecting the WBs to a much higher extent. There is an extensive economic literature on regional integration and EU accession process (Börzel & Risse, 2009; Brusis, 2001). However, every accession process is different and so is the WBs one. Scalera (2017) indicates that a threshold for the EU membership is set at a higher level than ever before, which corresponds to the following logic of EU officials: the farther from Central Europe, the more difficult it is to become an EU member. As mentioned earlier, the EU demands more from the WBs in the field of regional integration. As Kathuria (2008) observes:

The eventual goal [for the WBs], of course, is full EU membership, which would allow the region to take advantage of a framework that in practice constitutes the deepest integration between countries. This report makes the case that regional integration is a stepping stone to the eventual goal of the EU membership. (p.69)

In this respect, we can draw an analogy between EU 2004 Enlargement and their approach to regional integration. It was the largest EU enlargement in its history and all these countries were quite diverse at that time. Nevertheless, there has been one official regional integration within four of these countries, namely the Czech Republic, Hungary, Poland, and Slovakia, which form the Visegrád Group. However, six other countries (Cyprus, Estonia, Latvia, Lithuania, Malta, and Slovenia) that joined the EU in 2004 did not establish such a group and could still manage to become an EU member state. Cyprus and Malta were outliers in terms of geographic location which are small island countries. Analyzing the current perspective of the EU accession by the WBs countries, one may express the connection between them and Croatia at the stage before the EU accession. Croatia joined the EU in 2013 but before that, it was considered to be (unlike Slovenia) a part of the WBs. Contrary to Kathuria (2008), we do not support the idea that a country needs to make all the effort to address regional integration as a priority on the EU accession path. We do not consider Croatia as a country that put more emphasis and efforts on regional integration in the pre-accession period. Owing to meeting all EU acquis, Croatia joined the EU and it seems that Croatia was not extremely active in regional integration in comparison to the other WBs countries. Seroka (2008) states that regional integration was perceived as a key element for the EU accession process of the WBs. Following this concept, at first, the WBs should be integrated, and then all of them should join the EU. However, this did not happen because Croatia joined the EU in 2013. Croatia was the most advanced country in the EU enlargement process and at some point, EU officials realized that they can no longer postpone Croatia's accession. If we assume that the idea of fully integrated WBs failed when Croatia joined the EU in 2013,

then we can simply treat regional integration as a voluntary activity, not as a requirement, in the EU accession path.

Conclusion

Fostering a regional growth in the WBs is still a significant challenge due to political disputes and events from the past, where the majority of WBs formed a single country called Yugoslavia. This paper clearly takes the position that regional development in the WBs should not be addressed in the very first place (before the EU accession), as they face many different economic problems which correctly resolved may truly contribute to the EU accession. Regional development only appears in the EU *acquis* in the institutional dimension. It requires a candidate country to be ready to transfer money, mainly from the ERDF, to regions. Instead of focusing on regional development *per se*, a country should consider a strategy that would positively impact institutions. Well-functioning institutions which are economically efficient have a positive impact on regional development. Most existing research papers directly relate the EU accession of the WBs with regional development. More specifically, they argue that weak regional development in the WBs excludes them from joining the EU and, in that sense, they recommend that this 'burning issue' needs to be treated with the priority. Out of all EU new member states, no country was perfectly regionally integrated, however, all of them managed to meet all the criteria (EU *acquis*) and owing to that become a member of the EU. It is much easier for them to work on regional development as an EU member, through the Cohesion Policy and Structural Funds, than doing so with their own resources, which would in many cases be, the so-called mission impossible.

FOSTERING SUSTAINABLE INDUSTRY, INNOVATION AND INFRASTRUCTURE AS A PART OF SUSTAINABLE DEVELOPMENT AGENDA IN THE EU COUNTRIES: SPATIAL ANALYSIS

Tomasz GRODZICKI

Nicolaus Copernicus University
Jurija Gagarina 13a, 87-100 Toruń, Poland
tomgro10@wp.pl, tg@doktorant.umk.pl

Abstract. *The EU has prepared a sustainable development package that is a part of the 2030 Agenda for Sustainable Development. The core of this agenda is sustainable development goals. One out of the seventeen sustainable development goals set by the EU is to promote inclusive and sustainable industrialization as a powerful driver for improving standards of living and ending poverty worldwide. This goal is measured by seven independent indicators including CO2 emissions, employment in medium and high technology manufacturing sectors, gross domestic expenditure on R&D, patent applications to the European Patent Office, R&D personnel, collective transport modes in total passenger land transport, and rail and inland waterways activity in total freight transport. The aim of this paper is to analyze industry, innovation, and infrastructure in the EU countries in order to find out: (1) which countries are leading in this field, (2) which countries need to work on these issues so that they can catch up with the leaders. The following methods are used in order to address the above-mentioned research questions: the taxonomic measure of development, linear ordering, spatial trend models, and spatial autocorrelation approach.*

Keywords: *EU countries; industry; innovation; infrastructure; sustainable development goals (SDGs).*

Introduction

The 17 Sustainable Development Goals and 169 related tasks are a continuation of the Millennium Development Goals. The aim of the Sustainable Development Goals and related tasks is to respect human rights for all people and to achieve gender equality and empower all women. The goals of Sustainable Development are interdependent and indivisible and provide a balance between the three aspects of sustainable development: economic, social and environmental.

United Nations (2015) imply that the 9th sustainable development goal (SDG 9) is to promote inclusive and sustainable industrialization as a powerful driver for improving standards of living and ending poverty worldwide. This goal aims to build a stable infrastructure, promote sustainable industrialization and support innovation. All these should be done by the following objectives: (1) by building a reliable, stable and sustainable infrastructure quality, including regional and cross-border infrastructure, supporting development of economic and human well-being. Ensure equal access of all people to infrastructure at an affordable price. Moreover, (2) sustainable and inclusive industrialization should be promoted and by 2030 significantly the aim is to increase the share of industry employment in generating GDP, taking into account national circumstances and doubling this share in the least developed countries. Next step that

shall be taken is to (3) increase access to financial and affordable services loans and turn them into value chains and provide them with market share, particularly for small and medium-sized enterprises, including industrial ones, in especially developing countries. In addition, (4) SDG 9 intends to modernize infrastructure and industry to ensure its sustainable development, while increasing the efficiency of the use of resources: clean and environmentally friendly technologies and production processes, with the participation of all countries, according to their capabilities, until 2030. Innovation is based on the research, so the next goal is to (5) strengthen research and increase the technological level in all countries, especially in developing countries, and by 2030, foster innovation by a significant increase in the number of employees the research and development sector for every million people and through increasing public and private financing for development. The United Nations also aim to (6) facilitate the development of sustainable and stable infrastructure in countries developing by increasing financial, technological and technical support for African countries, the least developed countries, and developing countries. In addition to that, there is a need to (7) support national technological development, research and innovation in developing countries, including policies that aim for industrial diversification and an increase in the added value of commodities. Last but not least, there shall be (8) a significant increase in access to information and communication technologies and provide affordable and universal access to the internet in the least-developed countries by 2020.

In line with these goals, table 1 presents some facts and statistics prepared by the United Nations (n.d.) in order to better address the problem of this specific SDG.

**Table 1. Facts and statistics about issues concerning SDG 9
(based on the United Nations, n.d.)**

In many developing countries there is a lack of basic road infrastructure, sanitary and water systems, electricity and information and communication technology.
Around 2.6 billion people in developing countries do not have 24-hour access to electricity.
2.5 billion people are deprived of basic sanitation and almost 800 million people have no access to water, of which hundreds of millions live in sub-Saharan Africa and South Asia.
About 1 - 1.5 billion people in the world do not have access to reliable telephone services.
Good infrastructure is associated with achieving social, economic and political goals.
Poor quality infrastructure leads to a lack of access to markets, labor, information, and training, and is a major barrier to business development.
Poorly developed infrastructure limits access to health care and education.
In many African countries, especially those with lower income, insufficient infrastructure reduces the productivity of enterprises by around 40%.
Manufacturing plants are an important employer - in 2009, they employed about 470 million people, i.e. about 16% of the world's workforce estimated at 2.9 billion people. It is estimated that in 2013 over half a billion people worked in such enterprises.
The effect of multiplication of jobs as a result of industrialization has a positive impact on society. Each workplace in manufacturing plants creates 2.2 jobs in other sectors.
The most important for the early phase of industrialization are small and medium-sized enterprises that carry out production and processing activities, which usually create the most jobs. They create 90% of global business and employ 50-60% of the workforce.

Available national statistics show that 2.3 million people currently work in the renewable energy sector. Given that the data on this subject are not complete, this figure is very undervalued. It is predicted that due to the growing interest in alternative energy sources by 2030, 20 million jobs will be created in the renewable energy sector.

Least developed countries have enormous economic potential in the production of food and beverages (agricultural industry), textiles and clothing. It is also good for the future of a generation that will benefit from sustainable employment and greater productivity.

Middle-income countries can benefit from industry and metal processing, which offers a whole range of products sought after in international markets.

In developing countries, only less than 30% of agricultural production is subject to industrialization. In turn, in high-income countries, this percentage is 98%. This illustrates how great opportunities for developing countries are created by agricultural business.

Many of the above-mentioned facts do not apply to Europe, however, it is of great importance that SDGs should be applicable in every country. It means that Europe may not have the same problems as African countries but Europe needs to work on every single SDGs as others because there is always room for improvement. Improving its performance in SDGs, Europe can also improve the performance of others in a direct (by directly helping weaker countries) or indirect way (by showing an example to follow).

Therefore, this paper is to analyze the EU countries in terms of their performance in SDG 9. It is interesting to see if the EU countries improved their level of SDG 9 measures and which countries are leading in this field. Although, European countries are in a comfortable position in comparison to some underdeveloped countries, e.g. in Africa, Asia, and South America, because they do not need to focus on addressing some burning issues like i.e. problems with water or electricity, they can still improve their performance in SDGs so that they can help those in needs (World Bank, 2017). However, one should remember that it is very problematic to achieve a sustainable way of an economic system in Europe in time of omnipresent phenomena of globalization (Barry et al., 2004).

Walz et al. (2017) clearly indicate that achieving sustainable development goals requires innovation. They also add that green innovation is of great importance in the sustainable development concept. The role of innovation in the prevention of global ecological catastrophe has been embedded in the North-South economic development from the very beginning. According to the Environmental hypothesis of the Kuznets Curve (EKC), environmental pressure is growing faster than income in the first stage of economic development. Then, there is a second stage, in which environmental pressure continues to grow, but slower than GDP. After reaching a certain level of income, the pressure on the environment decreases in spite of constant income growth.

Sarangi (2017) implies that science, technology, innovation and Capacity Building Technology are at the core of social, economic and environmental development. It is essential that there are a knowledge and technology transfers from developed to developing countries. This ensures an access to technology since many technologies are initially developed in developed countries. Technology transfer includes a complex process of sharing knowledge and adapting technologies so they can meet local conditions. Therefore, there is a need to implement scientific and technological knowledge in national development plans and strategies so that innovation can be fully

exploited. Thus, Gusmão Caiado, et al. (2018) underline that SDGs are to create more inclusive and equal nations all over the World. This may be done by i.e. encouraging co-creative practices in order to stimulate collaboration in innovative sustainable practices, especially in such a transfer of innovation between developed and developing countries.

Data and methodology of the research

The research concerns the situation of SDG 9 in EU countries. Data for this research are available in Eurostat (2018), however, due to the fact that some of the indicators are measured only from 2008, this paper focuses only for the period starting from 2008 and ending in 2016. SDG 9 is measured using seven indicators listed in table 2.

Table 2. Facts and statistics about issues concerning SDG 9

gross domestic expenditure on R&D by sector (S)
employment in high- and medium-high technology manufacturing sectors and knowledge-intensive service sectors (S)
R&D personnel by sector (S)
patent applications to the European Patent Office (S)
share of collective transport modes in total passenger land transport by vehicle (S)
share of rail and inland waterways activity in total freight transport (S)
average CO2 emissions per km from new passenger cars (D)

Note: (S) – stimulant, (D) – factors with opposite effects to stimulant

Statistical Office of the European Communities (2016, p.80) also proposes the eco-innovation index as ‘more holistic approach to measuring innovativeness of EU countries.’ However, it is omitted for the need of this paper, since the focus is to present official indicators set by the United Nations which are then approved by the European Commission and applied by Eurostat.

Patent applications indicator is excluded in this research because the data are only available up to 2014, whereas for all the others (except for transport modes where data are available until 2015) the data are available for at least until 2016. It should be noted that some of the missing data in indicators of SDG 9 (for some countries in some years) are estimated by Eurostat and some estimation is done for the need of this paper using estimating missing data methods, including trend models and cluster analysis.

In order to measure their performance in this SDG, the following methods are used: the taxonomic measure of development (TMD), linear ordering, spatial trend models (Schabenberger & Gotway, 2005, p.235), spatial autocorrelation approach (Moran, 1950; Schabenberger & Gotway 2005, p.21) and panel data models (Baltagi, 2008). The taxonomic measure of development is used in order to find out which EU countries are leading in the performance of fulfilling SDG 9.

Initially, we have to choose a set of diagnostic variables and determine their character. Due to the initial heterogeneity of variables, there is a need to make them comparable using normalization procedure. In this research, 0-1 scaling standardization is applied (Sobczyk, 2006, p.83). Then, standardized variables are used to designate the so-called Hellwig’s development pattern (Hellwig, 1968). After this, the distance of each point (country, in this case) from the development pattern is determined using a Euclidean distance (Pluta, 1977, p.21). The next step is to normalize synthetic measure for EU

countries for the period of 2008-2016. The synthetic measure is determined in line with Pluta (1977, p.25) and it is named in this paper as SDG 9. It should be noted that Croatia is excluded from this analysis due to the lack of complete dataset for the analyzed period. Malta and Cyprus are also excluded, partially because of incomplete data (not to this extent as in the case of Croatia), because they do not have neighbors since they are islands. Using the above mentioned spatial methods, there is a common border criterion that a country needs to have in order to proceed with the analysis, which Malta and Cyprus do not have. Table 3 shows the explanation (categories) of sections used in maps in figures 1 and 3.

Table 3. Category of countries according to SDG 9

Category	Section
The highest score of SDG 9 / GDP	>Median+Q
Medium score of SDG 9 / GDP	[Median, Median+Q)
Low score of SDG 9 / GDP	[Median-Q, Median)
The lowest score of SDG 9 /GDP	<Median-Q

All calculations and figures are made using the following software Gretl, R-Cran, Python and MS Excel.

Research results and findings

Table 4 presents the rankings of SDG 9 in EU countries for the period of 2008-2016. It is clearly seen that DE has been a leader in terms of SDG 9 throughout the analyzed period. Second and third positions are taken either by DK or FR depending on the year in the research period. It can be easily observed that the best performing countries (top 10 – the first 10 records in table 2) in this measure are the so-called the old EU member states. The first country from the new EU member states is the Czech Republic that is placed on the eleventh position in 2016. However, the Czech Republic is the only country from the new member states that managed to be above the EU 28 average in 2016 in SDG 9 indicator. It does mean that the Czech Republic is performing very well in this indicator while all the other new member states are lagging behind the EU 28 average.

Table 4. Rankings of SDG 9: innovation, industry, and infrastructure for the EU countries in the period of 2008-2016

Rank	2008	2009	2010	2011	2012	2013	2014	2015	2016

Figure 1 illustrates the spatial differentiation of taxonomic measure of development for SDG 9 in the years 2008 and 2016 in EU countries. The best performing countries are marked with the darkest blue color. In 2008, the best performing countries in this measure are Scandinavian countries and western EU countries, on average. While the central and eastern EU countries are the ones with the lowest score in SDG 9. In 2016, the situation, on average, seems similar to the year 2008, however, there are some changes in individual countries. Countries that managed to improve their situation (compare to median measure) in this measure are Ireland, the Netherlands, Slovenia, and Sweden. In turn, the following countries worsened their position: Spain, Italy, Poland, Hungary, and Finland.

Figure 1. A taxonomic measure of development for SDG 9 in the years 2008 and 2016 in EU countries

Note: White color in the above maps represent Germany that is the so-called outlier with the highest value of the variable.

Source: own elaboration.

Figure 2 presents the trend surfaces of the TMD of SDG 9 for the 2008 and 2016. It shows the supposition of the presence of the second-degree spatial trend. It would mean that on average, Scandinavian and western EU countries score the highest in SDG 9 while central and eastern EU countries are worse off.

Figure 2. Trend surfaces of taxonomic measure of development for SDG 9 across EU countries in the years 2008 and 2016

In order to find out about the spatial structure of SDG 9 in EU countries, the degree of spatial trend and Moran's test for spatial autocorrelation are applied, and the results are presented in table 5. There is indeed, a second-degree spatial trend for SDG 9 so it confirms the preassumption from figure 2 in the period of 2008 - 2016. The results from Moran's test imply that there is no spatial autocorrelation since the p-value for Moran's I statistics in every year is greater than the level of significance, which is 0.05. Therefore, it can be noted that the after taking into account the spatial trend, countries with similar values of the examined measure do not form clusters.

Table 5. Results of spatial trend and autocorrelation in the synthetic measure of SDG 9

Year	The degree of spatial trend	Moran's I	p-value
2008	2	-0.2464	0.1419
2009	2	-0.2599	0.1259
2010	2	-0.2838	0.1037
2011	2	-0.2582	0.1299
2012	2	-0.2619	0.1254
2013	2	-0.2890	0.0998
2014	2	-0.3497	0.0548
2015	2	-0.3290	0.0678
2016	2	-0.3268	0.0687

Analyzing innovation, industry, and infrastructure in EU countries, one should note that meeting the goal set by the United Nations may be related to how rich a particular country is. Therefore, intuitively, the next procedure checks whether GDP *per capita* has something to do with SDG 9. Therefore, the following research hypothesis is constructed: EU countries that are doing better, on average, in meeting SDG 9: industry, innovation, and infrastructure; at the same time, they are richer than the others in terms of GDP *per capita*.

$$GDP_{i,t} = \theta_{00} + \theta_{10}s_{1i,t} + \theta_{01}s_{2i,t} + \theta_{20}s_{1i,t}^2 + \theta_{11}s_{1i,t}s_{2i,t} + \theta_{02}s_{2i,t}^2 + \alpha SDG9_{i,t} + \beta SDG9_{i,t-1} + \varepsilon_{i,t} \quad (1)$$

where:

$s_{1i,t}, s_{2i,t}$ - coordinates of locations of the spatial units

GDP - Gross Domestic Product per capita

SDG9 - level of innovation, industry, and infrastructure SDG 9 measured with the use of a taxonomic measure of development

Figure 3 presents the spatial differentiation of GDP *per capita* in EU countries the years 2008 and 2016. The general tendency seems to be similar to SDG 9 in figure 1, on average, Scandinavian and western EU countries are richer than central and eastern European countries.

Figure 3. Spatial differentiation of GDP per capita in the years 2008 and 2016 in the EU countries

Figure 4 presents trend surfaces for GDP per capita across EU countries in the years 2008 and 2016. Figure 4 indicates the supposition of the presence of the second-degree spatial trend. In this case, there is also a similarity between GDP per capita and SDG 9 spatial distributions (this can be seen not only on the maps but also in the adjusting trend surfaces).

Figure 4. Trend surfaces for GDP per capita across the EU countries in the years 2008 and 2016

The results from panel data model are included in tables 6 and 7. After excluding statistically insignificant variables (which p-value is greater than 0.05) we do have the model that implies that the first time-lag SDG 9 do influence the performance in GDP *per capita*.

Table 6. Results of testing hypothesis – panel data model, random effects

Parameter	Estimate	Std. error	z-statistics	p-value
θ_{00}	154395.000	151807.000	1.017	0.309
θ_{10}	2171.760	1995.930	1.088	0.277
θ_{01}	-6378.630	6214.040	-1.026	0.305
θ_{20}	-49.114	27.240	-1.803	0.0714
θ_{11}	-40.716	40.874	-0.996	0.3192
θ_{02}	77.661	63.861	1.2160	0.224
α	-4585.740	10661.100	-0.430	0.667
β	26761.900	9356.890	2.860	0.004
Breusch-Pagan test: $\chi^2 = 663.636$ p-value = 0.000				
Hausmann test: $\chi^2 = 0.734$ p-value = 0.693				

Table 7. Final results of testing hypothesis – panel data model, random effects

Parameter	Estimate	Std. error	z-statistics	p-value
θ_{00}	7541.170	9509.320	0.793	0.428
θ_{20}	-38.490	10.622	-3.624	0.000
θ_{02}	8.929	3.740	2.388	0.017
β	24913.200	7039.180	3.539	0.000
Breusch-Pagan test: $\chi^2 = 670.539$ p-value = 0.000				
Hausmann test: $\chi^2 = 0.054$ p-value = 0.816				

The very last step of this paper is to check the rate of growth in SDG 9 across EU countries, for the year 2016 in comparison to 2008, what is shown in Figure 5. It is calculated by the difference in TMD of SDG 9 from 2016 to 2008 which is then divided by TMD of SDG 9 in 2008. The rate of growth in SDG 9 for EU countries is 0.1124. Countries that worsened their results, scored less than 0 and are marked with green color. Then, countries that scored between 0 and 0.1124 are marked with bright red. Finally, the best performing countries that score more than the rate of growth for the EU, are colored with dark red.

Figure 5. The rate of the growth in SDG 9 across EU countries

It is interesting to analyze the countries with a declining trend of performance in SDG 9, what is illustrated in figure 6. Countries that are lagging behind the others in terms of rate of growth in SDG 9 are LU, HU, ES, SK, PL and RO which is the worst-off.

Figure 6. The values of the SDG 9 in 2008-2016 for the countries with a declining trend of SDG 9

Sustainable development goals are indeed needed in the contemporary World but it turns out that it is not necessarily an easy task to fulfill them. One can expect that all countries would be trying to follow the 2030 agenda and improving their performance,

even slightly, in all measure. However, this paper shows that there is room for improvement for EU countries, in particular, central and eastern EU countries, in meeting SDG 9. The focus of the European Commission (2017) is to monitor progress in R&D, innovation, industry, and infrastructure, but the question for a debate is whether the EU can implement some strategy across its member states so the progress can be expected in the future in all SDGs.

Conclusion

Sustainable development goals have been set in order to improve the quality of life of human being on the planet. Although there is a common will in fulfilling agenda 2030, the economic measures of particular statistics show that more effort is needed. Analyzing innovation, industry, and infrastructure as SDG 9, it is clear that old EU member states are doing better than new EU member states, on average. The richer the EU country in terms of GDP *per capita* is, on average, the more advanced it is in fulfilling SDG 9: industry, innovation, and infrastructure. The rate of growth in SDG 9 across EU countries is quite differential what makes it more difficult to indicate what is the overall EU approach to this problem, which seems to be more country-specific one. Further research on innovation, industry, and infrastructure in the EU will: (1) include a wider range of indicators than only those supported by the SDGs, (2) focus on the regional dimension of a particular EU country or group of countries.

SPATIO-TEMPORAL ANALYSIS OF THE CONVERGENCE OF CONSUMPTION EXPENDITURES IN THE EUROPEAN UNION COUNTRIES

Mateusz JANKIEWICZ

Nicolaus Copernicus University in Toruń
Gagarina 11, 87-100 Toruń, Poland
mateuszj@doktorant.umk.pl

Abstract. *The paper presents an analysis of the convergence process of the households' final consumption across European Union countries in the period of 2004 – 2016, considering spatial dependencies. The consumption is the main factor of the Gross Domestic Product. Previous studies focused on the economic convergence – a few researchers analyzed consumption convergence. This paper is based on previous studies on consumption convergence. The primary aim of the study is to verify hypothesis about the occurrence of the convergence process in households' final consumption expenditures across EU countries. The second aim is to verify whether the sustainable consumption significantly influences the researched process. The sustainable consumption is one of the several Sustainable Development Goals (SDGs) defined in the 2030 Agenda for Sustainable Development. However, some EU countries that want to align the level of consumption expenditures do not pay attention at sustainability. It depends among others on the consumerism idea. In the analysis, the level of the households' final consumption expenditures per capita is applied as the consumption. The sustainable consumption process is calculated using Hellwig's taxonomic measure of development (TMD), based on four diagnostic variables: final energy consumption, energy productivity, share of renewable energy in gross final energy consumption, resource productivity and domestic material consumption (DMC). To verify spatial dependencies in considered processes the spatial autocorrelation is tested. Consumption convergence process is verified with absolute and conditional β -convergence approach. In the first place, β -convergence panel data models are estimated and verified. Then, models are supplemented with a spatial factor – the dependence on the neighborhood countries. The spatial autoregressive and spatial error β -convergence panel data models are used. In the investigation of the conditional convergence the following indicators are added: the sustainable consumption and the period of financial crisis. The financial crisis slowed down the consumption convergence process in EU countries. As a result of the study, the sustainable consumption does not have a significant influence on the convergence process.*

Keywords: *convergence process; households' final consumption; spatial autocorrelation; spatial panel data models; sustainable consumption; sustainable development.*

Introduction

One of the most important goals for a country is to grow fast and to catch up with the richer and more developed economies. That is why many researchers are interested in the convergence process, e.g. Barro et al. (1991), Carnicky et al. (2016), Corrado et al. (2005), Dall'Erba and Le Gallo (2008), Górna et al. (2013), Górna and Górna (2014), Kulhánek (2012) and von Lyncker and Thoennessen (2017). The convergence process means that the level of the Gross Domestic Product (GDP) of countries is becoming more

and more similar. Consumption is the main component of the GDP in most economies. According to Huang and Rust (2011) the final consumption expenditures of households mainly reflect the standard of living in every country. Many authors analyzed the convergence of the level of living (e.g. Attia & Bérenger, 2009; Kuc, 2014; Muszyńska & Müller-Frączek, 2015), but only a few of them identified this process with the level of consumption. The households in the EU poorer economies are seeking to increase the consumption in order to overcome the differences in its level. In some of them, sustainability in consumption can be violated. Sustainable consumption and production is one of the goals of the sustainable development.

The primary aim of the investigation is to analyze spatial dependence in the formulation of households' final consumption level across the European Union countries (excluding Croatia, Cyprus and Malta) in the period of 2004-2016. Next aim is to evaluate the convergence of the consumption process using absolute and conditional β -convergence approach for pooled time series and cross-sectional data (TSCS). In the conditional approach the influence of the level of sustainability in consumption on the convergence process is considered.

Sustainable development and sustainable consumption

The sustainable development is defined in many different ways. The most popular is Brundtland Report definition: "development that meets the needs of the present generation without compromising the ability of future generations to meet their own needs" (WCED, 1987). Other definitions have offered a slight change in emphasis or added further requirements. Sustainability is the basis for today's leading global framework for international collaboration – the 2030 Agenda for Sustainable Development. In this Agenda the Sustainable Development Goals (SDGs) are presented. The one of them is the 7th goal called Sustainable Consumption and Production (SCP). Analysis of this topic and relation between the SCP and the economic growth was conducted e.g. by Alshehry and Belloumi (2015), Bhattacharya et al. (2016), Lukman et al. (2016), Salimath and Chandna (2018). The following specific goals in SDG7 are identified (the 2030 Agenda for Sustainable Development):

- a) "ensure universal access to affordable, reliable and modern energy services",
- b) "increase substantially the share of renewable energy in the global energy mix"
- c) "double the global rate of improvement in energy efficiency"
- d) "enhance international cooperation to facilitate access to clean energy research and technology, including renewable energy, energy efficiency and advanced and cleaner fossil-fuel technology, and promote investment in energy infrastructure and clean energy technology"
- e) "expand infrastructure and upgrade technology for supplying modern and sustainable energy services for all in developing countries, in particular least developed countries, small island developing States and landlocked developing countries, in accordance with their respective programmes of support".

Subject and scope of the investigation

The study concerns the consumption convergence process in the European Union Countries (excluding Croatia, Cyprus and Malta) in the period of 2004-2016. Moreover, the influence of the level of sustainable consumption on this process is considered. The households' final consumption per capita indicator has been analyzed. The indicator of

the sustainable consumption (SCP) has been evaluated using Hellwig's taxonomic measure of development (TMD). Table 1 presents the diagnostic variables used in enumeration of this measure.

Table 1. Diagnostic variables used in enumeration of the TMD
(author's own elaboration)

Variable	Process	Character
X ₁	Final energy consumption (millions of TOE)	destimulant
X ₂	Energy productivity (euro per kilogram of oil equivalent)	stimulant
X ₃	Share of renewable energy in gross final energy consumption	stimulant
X ₄	Resource productivity and domestic material consumption (DMC) (euro per kilogram)	stimulant

In the Eurostat database, there are more variables characterizing sustainable production and consumption goal (for example CO₂ emission). However due to incomplete data these characters are not included in the investigation.

The adopted spatial aggregation and time range of this study makes it easy to adopt tools of the spatial econometrics to analysis of the consumption convergence process. The spatial dependence is investigated using the spatial autocorrelation (based on the Moran's *I* statistics). In the previous analysis of the consumption in EU the spatial dependence approach was used by Author (Jankiewicz, 2018). The pooled TSCS data models and spatial panel data models are estimated in order to verify the convergence hypothesis.

The first hypothesis in this study concerns the large diversity of the households' final consumption expenditures in the EU countries. The second one applies to significant influence of the spatial location on the consumption convergence process. Moreover, the third hypothesis concerns the dependence of the consumption on its sustainability (whether the improvement in the sustainable consumption and production has a positive impact on the consumption convergence).

Data

The data applied in this study come from the Eurostat database. All analyzed variables are taken directly from database. The calculations and figures are made using R-Cran software (version 3.4.1).

First of all, the spatial differentiation of the households' final consumption per capita (Y) in the first and the last year of the investigation is analyzed. Figure 1 shows the spatial formation of values in this process. High level of consumption is observed in West (except Portugal in 2004 as well as Spain and Portugal in 2016) and North part of Europe. Maps in Figure 1 clearly indicate the fact that the EU is divided into two parts: Central-Eastern and Southern-Western. Most of the EU countries that joined the EU in 2004 (except Cyprus and Malta) are characterized with a low level of consumption per capita (less than mean) in both years of the study.

Figure 1. Spatial differentiation of the households' final consumption expenditures per capita across the European Union countries in the years 2004 (a) and 2016 (b) (author's own elaboration)

Methodology

The research starts with a calculation of the SCP indicator. The synthetic variable is calculated with the use of the TMD. Few steps are needed to get the value of TMD. The first step is to choose the diagnostic variables – the ones which characterize the process. The diagnostic variables used in this research are presented in Table 1. Next step is to define a character of these variables – which is a stimulant (having a positive influence on measured process) and which is a destimulant (having a negative influence on measured process) (Kolenda, 2006). The third step of calculation is to normalize values of variables. The standardization formula was used:

$$x_i' = \frac{x_i - \bar{x}}{S(x)},$$

where: x_i' - standardized value of the process X for i^{th} object, x_i - real value of the process X for i^{th} object, $\bar{x}$ - mean value of the process X , $S(x)$ - standard deviation of the process X .

Next step of the TMD calculation is to determine the pattern of development (fixed for all period of analysis) – vector of standardized coordinates:

$$Q = [z_{01}, z_{02}, z_{03}, z_{04}],$$

where coordinates of pattern are identified as follows:

$$z_{0j} = \begin{cases} \max_i x_{ij}', & \text{for } j \in \{S\} \\ \min_i x_{ij}', & \text{for } j \in \{D\} \end{cases}$$

where: $\{S\}$ and $\{D\}$ are sets of stimulants and destimulants respectively.

After determining the pattern of development the distance of all objects (countries) from the pattern. The Euclidean distance formula is used:

$$d_{i0} = [\sum_{j=1}^4 (z_{ij} - z_{0j})^2]^{0.5} \quad (i = 1, \dots, 27).$$

The TMD is identified as follows:

$$SCP_i = 1 - \frac{d_{i0}}{d_0} \quad (i = 1, \dots, 27),$$

where: $d_0 = \bar{d}_0 + 2s_0$ – the norm of distance d_{i0} , where $\bar{d}_0$ is mean of distances of all objects, s_0 – standard deviation.

Based on this synthetic measure rankings of countries were created.

Next step of the study is to analyze spatial dependence of households' final consumption expenditures and sustainable consumption. The spatial dependence is evaluated using Moran's test based on Moran's I statistics (Moran 1950, Schabenberger and Gotway 2005). The test statistic takes the following form (Suchecky, 2010):

$$I = \frac{1}{\sum_{i=1}^n \sum_{j=1}^n w_{ij}} * \frac{\sum_{i=1}^n \sum_{j=1}^n w_{ij} [y_i - \bar{y}][y_j - \bar{y}]}{\frac{1}{n} \sum_{i=1}^n [y_i - \bar{y}]^2} = \frac{n}{S_0} * \frac{\mathbf{z}^T \mathbf{W} \mathbf{z}}{\mathbf{z}^T \mathbf{z}},$$

where:

y_i – an observed value of the phenomenon in the region i ,

$\mathbf{z}$ – a column vector with elements $z_i = y_i - \bar{y}$,

$S_0 = \sum_{i=1}^n \sum_{j=1}^n w_{ij}$ – a sum of the corresponding elements of the weights matrix (in the study weights matrix based on the common border criterion is used),

n – number of regions.

Spatial autocorrelation investigates whether the values of spatial process in neighboring spatial units are similar or not. Statistically significant positive value of the Moran's I statistics says that the processes in the neighboring spatial units are at the similar level. The negative value of this statistics says that the processes in the neighboring spatial units are at the different level. Random position of the values of the considered process is verified when Moran's I statistics is statistically non-significant.

After the investigation of spatial dependence, the convergence of the households' consumption expenditures is verified. The β -convergence approach is used (Barro & Sala-i-Martin, 1992) and the panel data and spatial panel data models are estimated (Baltagi, 2008; Suchecky, 2012). Models take the following forms:

1. Absolute convergence pooled model (Pooled)

$$\ln Y_{i,t} = \alpha_0 + (1 + \beta) \ln Y_{i,t-1} + \varepsilon_{i,t}$$
2. Absolute convergence panel data model with individual fixed effects (FE_IND)

$$\ln Y_{i,t} = \alpha_i + (1 + \beta) \ln Y_{i,t-1} + \varepsilon_{i,t}$$
3. Conditional convergence pooled model (Pooled)

$$\ln Y_{i,t} = \alpha_0 + (1 + \beta) \ln Y_{i,t-1} + \gamma \ln SCP_{i,t} + \delta CR + \varepsilon_{i,t}$$

4. Conditional convergence panel data model with individual fixed effects (FE_IND)

$$\ln Y_{i,t} = \alpha_i + (1 + \beta) \ln Y_{i,t-1} + \gamma \ln SCP_{i,t} + \delta CR + \varepsilon_{i,t}$$

5. Absolute convergence spatial autoregressive model (SAR_pooled)

$$\ln Y_{i,t} = \alpha_0 + (1 + \beta) \ln Y_{i,t-1} + \rho W(\ln Y_{i,t}) + \varepsilon_{i,t}$$

6. Absolute convergence spatial autoregressive panel data model with individual fixed effects (SAR_FE_IND)

$$\ln Y_{i,t} = \alpha_i + (1 + \beta) \ln Y_{i,t-1} + \rho W(\ln Y_{i,t}) + \varepsilon_{i,t}$$

7. Absolute convergence spatial error model (SE_pooled)

$$\ln Y_{i,t} = \alpha_0 + (1 + \beta) \ln Y_{i,t-1} + \eta_{i,t}, \quad \eta_{i,t} = \lambda W(\eta_{i,t}) + \varepsilon_{i,t}$$

8. Absolute convergence spatial error panel data model with individual fixed effects (SE_FE_IND)

$$\ln Y_{i,t} = \alpha_i + (1 + \beta) \ln Y_{i,t-1} + \eta_{i,t}, \quad \eta_{i,t} = \lambda W(\eta_{i,t}) + \varepsilon_{i,t}$$

9. Conditional convergence spatial autoregressive model (SAR_pooled)

$$\ln Y_{i,t} = \alpha_0 + (1 + \beta) \ln Y_{i,t-1} + \gamma \ln SCP_{i,t} + \delta CR + \rho W(\ln Y_{i,t}) + \varepsilon_{i,t}$$

10. Conditional convergence spatial autoregressive panel data model with individual fixed effects (SAR_FE_IND)

$$\ln Y_{i,t} = \alpha_i + (1 + \beta) \ln Y_{i,t-1} + \gamma \ln SCP_{i,t} + \delta CR + \rho W(\ln Y_{i,t}) + \varepsilon_{i,t}$$

11. Conditional convergence spatial error model (SE_pooled)

$$\ln Y_{i,t} = \alpha_0 + (1 + \beta) \ln Y_{i,t-1} + \gamma \ln SCP_{i,t} + \delta CR + \eta_{i,t}, \quad \eta_{i,t} = \lambda W(\eta_{i,t}) + \varepsilon_{i,t}$$

12. Conditional convergence spatial error panel data model with individual fixed effects (SE_FE_IND)

$$\ln Y_{i,t} = \alpha_i + (1 + \beta) \ln Y_{i,t-1} + \gamma \ln SCP_{i,t} + \delta CR + \eta_{i,t}, \quad \eta_{i,t} = \lambda W(\eta_{i,t}) + \varepsilon_{i,t}$$

The CR variable denotes the financial crisis period (years 2008-2010), Y is the level of the households final consumption expenditures, SCP – level of consumption sustainability, $W(Y)$ – spatial lagged dependent variable, ε – spatio-temporal white noise.

The convergence process is confirmed when in models (1) – (12) the parameter β is negative and $(1+\beta)$ is statistically significant. The significance of parameters ρ/λ confirms the meaningful influence of the spatial dependencies on the considering convergence process. Choice between the spatial autoregressive (SAR) model and the spatial error (SE) model is done using the Lagrange Multiplier tests (LM) and their robust versions (RLM) (Anselin et al., 2004; Arbia, 2006). The β parameter serves to calculate the $t_{half-life}$ value, which presents the time needed to reduce the difference by half. It is expressed as follows (Kusideł, 2013):

$$t_{half-life} = \frac{\ln(2)}{b},$$

where: $b = -\ln(1 + \beta)$ expresses the convergence rate.

Results of the research

The first step of the investigation is to analyze the spatial dependence of the considered variables. The level of the consumption sustainability for all EU countries is evaluated using the TMD. The spatial differentiation of the variable Y is shown in the Figure 1. Figure 2 presents the spatial differentiation of the level of consumption sustainability

across EU countries in the years 2004 (a) and 2005 (b). The Central-Eastern EU countries are characterized by a low and very low level of the considered process. Despite the very high values of the consumption in Germany and United Kingdom in 2004 (see Fig. 1), its sustainability is at the level below the EU average. The situation changed for the UK in the 2016 (level of the sustainability increased above the EU average). The consumption in the Northern-Western EU countries (except Germany and UK in 2004 and also Germany and Belgium in 2016) is more sustainable than in the rest part of the continent. Some countries with high level of the households' consumption expenditures are characterized by low consumption sustainability and vice versa. It is not a certain tendency in formation of the *SCP* variable.

Table 2 shows the rankings of countries based on the level of the households' final consumption expenditures (*Y*) and *SCP*. The certain differences in the rankings for both processes are observed. Portugal is in the second part of the ranking of the *Y* process (positions 15-16), while in the ranking of the *SCP* process is in the first part (positions 4-8). Countries with the highest level of the *SCP* process are the Scandinavian countries – Sweden and Denmark, while the lowest level of this variable is noted in Poland and Bulgaria. In Germany the consumption level is high, but less sustainable in comparison to other countries (Germany is at the bottom of the sustainability ranking). The rankings of the *Y* and *SCP* variables are slightly different.

Table 3 shows the results of analysis of spatial autocorrelation using Moran test. For variable Y, the Moran's *I* statistics is positive and statistically significant (p-value is less

than the adopted level of significance – 0.05) in whole period of the study. It means that countries with similar values of the level of consumption are located close to each other. For variable SCP the Moran's I statistics is not statistically significant. It means that the spatial autocorrelation does not occur.

Table 3. The results of the Moran test for processes Y and CSP (author's own elaboration)

Year	Final consumption per capita (Y)		Sustainable consumption and production (SCP)	
	Moran's I	p-value	Moran's I	p-value

Figure 3 presents comparison of the spatial differentiation of the level of consumption in the first year of investigation and its speed of growth. The certain tendency at the both maps in Figure 3 is presented. The countries with the lowest level of the households' consumption expenditures in 2004 have the highest speed of growth. Based on Figure 3, a presumption about occurrence of the convergence process is formulated.

Figure 3. Spatial differentiation of the households' final consumption expenditures per capita across the European Union countries in 2004 (a) and its pace of growth in the period of 2004-2016 (b) (author's own elaboration)

To verify convergence process of consumption, the panel data model is estimated and verified. Table 4 shows the results of estimation and verification of β -convergence panel data models.

Table 4. The results of estimation and verification of the β -convergence panel data models (author's own elaboration)

Parameter	Absolute Convergence		Conditional Convergence

Four types of models are estimated – absolute convergence pooled and fixed effect and also conditional convergence pooled and fixed effect models. The parameter $(1+\beta)$ is statistically significant in all types of models and β is negative. It means that the convergence process of the consumption occurs. Considering models with individual fixed effects the pace of convergence is higher than for the pooled models. For residuals of all models the Moran's I statistics is statistically significant. That is why, it is reasonable to supplement models with spatial factor. Based on the LM and RLM statistics the spatial error model better reflects source of spatial dependencies. Table 5 presents the results of estimation and verification of the absolute β -convergence spatial panel data models.

As in the models without spatial dependencies the parameter $(1+\beta)$ is statistically significant in all types of models and β is negative. Spatial dependencies are not statistically significant only for spatial autoregressive pooled model (SAR_pooled). Spatial autoregressive (SAR) models show the spatial autocorrelation in residuals. Based on the AIC criterion spatial error models better reflects spatial dependencies in convergence process (AIC is lower than in spatial autoregressive models). Next, the conditional β -convergence spatial panel data models are considered. Table 6 presents the results of their estimation and verification.

$t_{half-life}$	14.5796	1.8161	12.8601	2.4120

To verify hypothesis about conditional convergence, models are supplemented with the following indicators: sustainable consumption level (SCP) – parameter γ and binary variable characterized financial crisis period (CR) – parameter δ . Like in previous models the parameter $(1+\beta)$ is statistically significant, and β is negative. Parameter δ is statistically significant and parameter γ is not significant in all models in Table 6. In spatial error panel data model with individual fixed effects the significance of the parameter γ is close to adopted level of significance. The spatial error models have better characteristics than the spatial autoregressive models – the AIC value is lower and residuals do not show the spatial autocorrelation.

Conclusion

In the analysis the consumption convergence process is considered. The investigation shows the differences between the Central-Eastern and Northern-Western part of the European Union. The level of consumption in Central-Eastern part of Europe is lower than in the remaining part of continent. However, their pace of growth is higher. It means that the households consumption expenditures are becoming more and more similar. Sustainability of consumption (as specified in this paper) does not have a significant impact on its convergence process. It can be the result of the consumerism idea. Countries, which want to increase their consumption spending or stay at its high level (like Germany), do not pay attention to the sustainable consumption. The financial crisis period implied that the consumption expenditures decreased and the convergence process slowed down. Moreover, a formation of processes (not included in investigation) in neighboring countries (except for consumption expenditures level) has a significant influence on the consumption convergence process.

Abstract. *This paper provides an introduction to some of the principles and approaches related to the concept of a circular economy which is relatively new at the European level especially in Central and South-Eastern Europe. In essence, a circular economy represents an alternative to the currently predominant linear take-make-consume-dispose economic model, which is not sustainable and in many cases is causing the wasting of natural resources. The circular economy according to the Ellen MacArthur Foundation aims to maintain the utility of products, components and materials and retain their value. It thus minimizes the need for new inputs of materials and energy, while reducing environmental pressures linked to resource extraction, emissions and waste. In the article there are presented main schools of thought in which circular economy has its origins. Among analyzed concepts are: cradle to cradle, industrial ecology, biomimicry, dematerialization and performance economy. The concept of circular economy is essential for whole Europe, however Central and South-Eastern Europe is in a specific situation because on one hand, some indicators, for example recycling rate and the amount of waste going into landfills without treatment are much higher than in Western European countries, but on the other hand, in the countries of Central and South-Eastern Europe, the amount of waste generated per capita is many times lower than in Western Europe. Wise implementation of circular economy programs can cause that in these countries waste management systems will be significantly improved in a relatively short time. In the article the comprehensive assessment of the European waste management systems and circular economy programs - which aim to manage all natural resources more efficiently and sustainably - are analyzed. European Commission Circular Economy Package which is going to stimulate Europe's transition towards a circular economy has been also analyzed. In the paper benefits related to the implementation of circular economy programs have been analyzed: environmental benefits which bring less environmental impact; economic benefits which bring opportunities for economic growth and innovation and social benefits which bring sustainable consumer behavior and job opportunities. Moreover, new business models which play an important role in the circular economy and have significant potential for increased economic, social and environmental benefits are presented. Among analyzed models are: remanufacturing and reuse; selling services rather than goods and sharing economy business model.*

Keywords: *circular economy; recycling; resource recovery; waste management; remanufacturing.*

Introduction

Among the important challenges in today's economy, one of the most important is the availability of resources. That is why the idea according to which today's goods are tomorrow's resources becomes very promising and worth deepening knowledge and further analysis. Nowadays in the EU, each person consumes 16 tons of materials annually, of which 6 tons are wasted, with half going to landfill. Trends show, however, that the era of plentiful and cheap resources is over (European Commission 2011). Businesses are facing rising costs for essential raw materials and minerals, their scarcity and price volatility are having a damaging effect on the economy. Thus, the transition to this new circular economy is inevitable, however, the question is how and how fast the countries will develop and implement the relevant new business models.

Nowadays it is possible to observe many cases of unsustainable overuse of resources and also increasing environmental degradation. That is why the developing of the concept of circular economy can contribute to decoupling economic growth from environmental degradation. Clean cycles of resources could radically decrease the amount of pollutions which are released to the environment and at the same time can foster prosperity of societies.

Most of the world economies in the XXI-st century remain locked into a system where everything from production economics to contracts, and from regulation to mind-sets, favors the linear model of production and consumption. Replacing this linear world with new circular business models seems to be a challenge for decades not only for European Union countries but also for all countries in the world. The greatest resistance associated with the transition to the new model is related to the fear that revenue and profits of companies will be decreased due to the lower demand for incremental sales.

In the article there are presented principles and approaches related to the concept of a circular economy and the selected aspects of the transition path to a circular economy in the region of Central and South-eastern Europe.

The genesis of the concept of circular economy

The concept of circular economy has its origins in a few schools of thought such as cradle to cradle; industrial ecology, biomimicry, dematerialization or performance economy.

- Cradle to Cradle concept as a design philosophy was developed by Michael Braungart and Bill McDonough. It is built on three principles: 'Waste equals food'— 'Use current solar income'— 'Celebrate diversity'. They consider all material involved in industrial and commercial processes to be nutrients, of which there are two main categories: technical and biological. According to this design philosophy, the flow of industrial materials could be guided in a way similar to biological materials - „biological metabolism” as a model for „technical metabolism”. For such an effective recycling system precisely defining the molecular composition of materials is needed. (McDonough & Braungart, 2002)
- Industrial Ecology concept is focusing on the restoration of natural capital and social wellbeing. In practice, it concentrates on connections between operators within the „industrial ecosystem”. The aim of this concept is to create closed-loop processes in which waste serves as a raw material. It adopts a systemic point of view and assumes designing production processes in accordance with local ecological constraints. This

approach is enabling the elimination of an undesired by-products. Moreover, its principles can also be applied in the services sector.

- Biomimicry concept it was created by Janine Benyus, author of „Biomimicry: Innovation Inspired by Nature“. She defines her approach as „new discipline that studies nature's best ideas and then imitates these designs and processes to solve human problems“. Biomimicry relies on three key principles: Nature as model: Study nature's models and emulate these forms, processes, systems, and strategies to solve human problems; Nature as measure: Use an ecological standard to judge the sustainability of our innovations; Nature as mentor: View and value nature not based on what we can extract from the natural world, but what we can learn from it.
- Dematerialization and ephemeralization - there are two similar concepts of which first refers to reduction in the quantity of materials required to supply needs of societies and serve economic functions in society and the second refers to increase in the efficiency of achieving the same products and services while requiring less resources, time and effort (Bailey, 2001)
- Performance Economy is the vision from the 70's presented in the report to the European Commission „The Potential for Substituting Manpower for Energy“. In the vision there was presented an impact of economy in loops on job creation, economic competitiveness, resource savings, and waste prevention. Moreover, the author of the report - professor Walter Stahel who founded in 1982, the Product-Life Institute - Europe's oldest sustainability consultancy - pursues four main goals: product-life extension, long-life goods, reconditioning activities, and waste prevention. The institute also promote the importance of selling services rather than products, and the concept of 'performance economy' and circular economy which is perceived as a coherent model ensuring further development in conditions of limited resources and high prices of natural resources.

Above schools of thought contributed to the creation of the concept of circular economy, which is the most often characterized as an „industrial system that is restorative or regenerative by intention and design It replaces the 'end-of-life' concept with restoration, shifts towards the use of renewable energy, eliminates the use of toxic chemicals, which impair reuse, and aims for the elimination of waste through the superior design of materials, products, systems, and, within this, business models" (Towards the Circular Economy, 2013, p.8)

As Daly and Farley says waste is just a resource we have not yet learned to use (Daly & Farley, 2004, p.41). Nowadays, not only in Europe but also in another developed country in the world most of the production-consumption processes are still traditional linear patterns, which in short can be describe as take-make-dispose approach. In this model raw materials are extracted from the environment, transformed into products and eventually disposed of. It is leading to scarcity, and higher levels of pricing. One of the threshold condition for the transition towards this new circular economy is also the change of consumer behaviors. Unfortunately, very often consumption does not follow real needs, but it is wasting consumption. Using the figures of World Bank Indicators, it follows that the wealthiest 20% of the world accounted for 76.6% of total private consumption; the middle 60% consume 21,0 % and the poorest 20% just 1.5% (Shah, 2014) Moreover the United Nations organization for many years alerts that: „the dynamics of the consumption-poverty-inequality-environment nexus are accelerating. If the trends continue without change — not redistributing from high-income to low-income consumers, not shifting from polluting to cleaner goods and production

technologies, not promoting goods that empower poor producers, not shifting priority from consumption for conspicuous display to meeting basic needs — today's problems of consumption and human development will worsen." (UNDP, 1998, p.1), according to what UN presents the real issue is not consumption itself but its patterns and effects.

The core principles of circular economy were outlined in the report of Ellen Macarthur Foundation „Towards the Circular Economy" and there are as follow:

- Waste are „design out" from processes. It determines that component and product have to circulate in economy. Reusing and recycling for the large scale prevent from disposal of materials.
- Demarcation between consumable and durable components of a product is introduced. Consumables component/products are made of biological renewable ingredients and durables one such as metals and most plastics are designed for reuse.
- Energy for production processes should come from renewable sources.

Moreover, in circular economy, in case of durable technical products the concept of consumer is assumed to be replaced with the concept of user. Such a shift from consumer to user means that instead of buy-and-consume approach the new solutions are promoted such as: leasing, renting or sharing. And for the consumer who are buying products there are incentives ensuring the return of the product, which could be reuse or could be recycled.

The „Towards the Circular Economy" report also indicates four sources of value creation by circular economy:

- The 'power of the inner circle' refers to minimizing comparative material usage vis-à-vis the linear production system.
- The 'power of circling longer' refers to maximizing the number of consecutive cycles
- The 'power of cascaded use' refers to diversifying reuse across the value chain,
- The 'power of pure circles', finally, lies in the fact that uncontaminated material streams increase collection and redistribution efficiency while maintaining quality (Towards the Circular Economy, 2013, p.30)

The concept of circular economy has a potential to create multifaceted economic, social and environmental benefits for economies, companies and customers. Benefits for Economies include substantial net material savings, mitigation of price volatility and supply risks. According to OECD, positive economic effects can arise from the availability of cheaper materials diverted from waste as an alternative to virgin materials, moreover costs of waste disposal can be reduced and residual economic value of existing material streams can be captured (OECD, 2013) Economies may also benefit from reducing the dependence on imported resources and providing new economic opportunities and contributing to long-term competitiveness. Benefits expected for companies include both short-term benefits, consisting mainly of cost reduction and some longer-term strategic opportunities. Key benefits include reduced material bills and warranty risks and improved customer interaction and loyalty. Benefits for customers consist of shortening the premature aging of ready-to-use products or reusable products. For the customer, this will mean a reduction in the cost of ownership. Benefits also include increasing the choice and convenience of customers because manufacturers can adjust the duration, type of application and ingredients of the product to a specific customer, offering a wider set of contractual options

Among the environmental and social benefits of the transition towards circular economy there are preserving and improving the quality of the environment, especially natural resources and better human health.

Policy supporting circular economy

In the face of challenges and opportunities related the transition from linear into circular model of economy, the EU aims to evolve its economic and social systems. Through the strategy for Europe 2020 – the EU has already expressed its belief in necessity to move to a more restorative economic system that drives substantial and lasting improvements of our resource productivity. The transition is supported by the EU Directives such as Waste Framework Directive 2008/98/EC, in which EU's five-step waste hierarchy prioritizing the prevention of waste generation was established, and another Directives such as: Directive 1999/31/EC on the landfill of waste; Directive 94/62/EC on packaging and packaging waste; Directives 2000/53/EC on end-of-life vehicles; Directive 2006/66/EC on batteries and accumulators and waste batteries and accumulators, and Directive 2012/19/EU on waste electrical and electronic equipment.

Even though, the waste prevention programs were established in all EU member states, the problem of waste is still a big challenge. In Europe, 2.7 billion tons of waste were generated in 2010, but only about 40% of that was reused, recycled, or composted and digested. Current recycling rate are significant for only a handful of waste types, mostly those that occur in large, fairly homogeneous volumes. A recent UNEP report, for example, notes that only around one-third of the 60 metals it studied showed a global end-of-life recycling rate of 25% or more (UNEP, 2011).

The waste management systems in most of European countries are inefficient. In these systems, most recyclable waste ends in landfills or is incinerated, with potentially harmful environmental impacts and significant economic losses. Over the past two decades many Member States have gradually improved their waste management. In 1995, on average 64% of municipal waste was landfilled in the EU. In 2000, the average had been reduced to 55% while the average recycling rate stood at 25%. In 2016, landfilling of household waste in the EU as a whole dropped to 24%, with recycling having increased to 46%. In 2016, ten Member States still landfilled over 50 % of their household waste and six of them incinerated 40% or more. However, there are huge variation in landfilling between Member States, with rates from 80% to 5% (European Commission, 2018). Municipal waste treatment methods and waste per capita is presented in the Figure 1.

Most of the countries with the highest landfilling rates are states from Central and South-eastern Europe. This is the biggest weakness of the waste management systems in these countries. However, the amount of municipal waste per capita is the lowest in the Central and South-eastern Europe countries and this is the biggest strength. In six countries: Romania, Slovakia, Latvia, Estonia, Czech Republic and Poland the amount of waste is smaller than 300 kg per capita which is much less than EU average: 481 kg per capita. Among the countries that produce the most waste per capita are Western European Countries: Denmark, Germany, Austria, Ireland and the Netherlands.

Figure 1. Municipal waste treatment methods and waste per capita in EU28
(Bourguignon, 2016, p. 2)

New business models and circular economy programs

When looking for new business models, which are possible to implementation in Central and South-eastern Europe it is necessary to focus on the specific business sectors especially the resource-intense one and the mainstream products reflecting the specificity of the economies of those countries. Nowadays economy is locked into a system where everything favors the linear model of production and consumption. Among the trends which support the transition from linear take-make-dispose into circular businesses there are following:

- Resource scarcity and tighter environmental standards;
- Advanced information technology enabling to trace materials through the supply chain, identify products and material fractions, and track product status during use. Furthermore, social media platforms exist that can be used to mobilize millions of customers around new products and services instantaneously.;
- New behaviors of consumers that prefer access over ownership (Bourguignon, 2016, p.2)

Among the mainstream products or waste categories with the highest rate of recovery, recycling or reuse are end-of-life vehicles, packaging waste and electrical and electronic waste

In case of end-of-life vehicles (ELV) it is estimated that every year, 8-9 million tons of ELV are generated in the EU and in all Member States. 80% to 100% of materials from ELVs are recovered or recycled. Apart from generating huge amount of waste from ELV, there are significant emissions of pollutants to the air caused by the use of vehicles. That is why in some European countries electromobility programs have been adopted. They have a large potential for improving air quality. The biggest impact on the quality of air in European cities is transport, thus development of electromobility creates real prospects for improving air quality. It will therefore affect not only the improvement of public health but also the reduction of damage to the environment and to the substance of buildings.

One of the first countries in Central-Eastern Europe in which Electromobility Development Plan was adopted is Poland. The government adopted the document in March 2017. The Plan forms the foundation for the development of a completely new and competitive market and it aims to create conditions for the development of electromobility, the development of industry associated with this new sector and the stabilization of the power grid. It is worth noting that among companies producing electric vehicles in Europe, one of the leader is Solaris Bus & Coach company from Bolechowo near Poznań in Poland, in which series production of electric buses began in 2013. Solaris Urbino bus has won a prestigious „Bus of The Year” title in 2017, awarded by Association of Commercial Vehicle Editors.

In case of packaging waste, which are made up of paper and cardboard (40%), glass (20%), plastic (19%), wood (15%) and metal (6%), average rate of recycling in EU is 65%, however material-specific recycling rates varied a great amount: 84% for paper and cardboard packaging; 72% for glass and metallic packaging; 38% for wooden packaging and 36% for plastic packaging. In this category there are wide variations in recycling rates for specific packaging materials across Member States. It is worth noting that among the countries with the highest rates of packaging waste recycling are countries from Central and South-Eastern Europe: Czech Republic, Slovakia, Slovenia and Bulgaria. The recycling rates in packaging waste by materials in EU28 was illustrated in Figure 2.

Figure 1. Recycling rates in packaging waste by material in EU28
(Bourguignon, 2016, p.2)

The third category of waste with high rate of recycling is electrical and electronic waste, also referred to as ‚e-waste’. The average rate of recycling and reusing for this category EU-28 is 71%. However, e-waste is one of the fastest growing waste streams, increasing at 3-5% per year (Bourguignon, 2016, p.3).

There are also other diverse products for which circular model works and they are not always small niche segments. To analyze this issue, it is useful to divide all products into three categories:

- Long lived products - this category includes products such as buildings, roads, bridges

- Medium-lived complex products - This category generally includes products which contain multiple parts and are subject to frequent technological innovation. The eight sectors, as categorized by Eurostat, which belongs to this category: machinery and equipment; office machinery and computers; electrical machinery and apparatus; radio, television, and communication equipment and apparatus; medical, precision and optical instruments, watches and clocks; motor vehicles, trailers, and semi-trailers; other transport equipment; furniture and other manufactured goods.
- Short-lived products and consumables — This category include products with a short usage period which are often consumed within days to months of initial production. It includes textiles, food, beverages and other agricultural products

For each of above categories there should be undertaken different steps towards a more circular economy. In case of long lived products, the key approach is eco-design which enable the products for a longer life, enabling refurbishment and remanufacturing. Moreover, such products should be based on the sustainable and minimal use of resources and enabling high-quality recycling of materials at the end of a product's life. Additionally, substitution of hazardous substances in products should enable cleaner material cycles. Circularity for long-lived has a great potential for value retention. The pilot initiatives from USA and Japan demonstrated that replacing demolishing with deconstructing approach may divert huge part of rubble from going to landfill and thus preserve valuable building components and materials for recycling and reuse. Moreover, deconstruction approach creates many additional jobs, which is of great social importance.

In case of medium-lived products repair, refurbishment and remanufacture should be given priority, enabling reuse of products and components. Moreover, in this category high-quality recycling of as much waste as possible should be applied. Enabling factors for this category will include not only development of well-functioning markets for secondary raw materials but also focus on offering product-service systems rather than product ownership; collaborative consumption; collaboration and transparency along the value chain and collaboration between companies whereby the wastes or by-products of one become a resource for another (industrial symbiosis).

In case of short-lived products, the transition should include the shift from technical nutrients to biological one whenever it is possible. Closing the loops for short-lived products will definitely help to build a restorative model that decouples economic growth from natural resource use. Key approach for this category should be innovative design of daily materials and products like biodegradable packaging or easy to disassemble office equipment. In addition, actions may be taken regarding the extension of the use of products or the cascading use of products.

Implementation of new circular business models for all above product categories will require leading corporations and municipal authorities to develop a new set of tools which could reinforce circular economy. It may include developments in resource markets, technology and information systems, and consumer preferences. Some examples of such tools were presented in the report: Towards the Circular Economy: Opportunities for the Consumer Goods Sector: urbanization that centralizes flows of consumer goods and waste streams; new technologies that enables dramatic improvements in the way value is extracted from today's biological waste streams; new

IT capabilities that support more precise management and tracking and tracing of biological flows in the system; new business models that improve control over scarce resources; a new models of collaborative consumerism; new packaging technologies and systems that extend food life and minimize packaging waste (Towards the Circular Economy, 2013, p.10).

An example of well-functioning recovery and recycling market is the market of used tires in Poland. As far as the legal obligations for recovery and recycling are defined for certain types of waste, for used tires it is 75% for recovery and 15% for recycling. The obligations in recovery and recycling of tires can be realized by the tires manufacturers and importers independently or through recovery organizations and the economic instrument to ensure a required level of recovery and recycling of waste is product payment. In Poland, the amount of new tires placed on the market is systematically growing and it has already reached the level of more than 200 thousand tones, few years ago. The required levels of recovery and recycling of waste tires are achieved every year and according to the Ministry of Environment record 36.6% level of recycling was reached in 2010 and a record 96.6% level of recovery was reached in 2013. The data shows that despite relatively low legal obligations the market mechanism are encouraging the entrepreneurs to reach higher levels of recovery and recycling than required.

In Poland, the recovery of used tires takes place primarily through energy recovery, where about 60% of the collected tonnage of used tires goes to cement kilns. The processes of material recycling are much more complicated. The tires should be cut, crushed and subjected to heat treatment. The different size rubber particles which are obtained in these processes, after adding the appropriate binders are used as surfaces of playgrounds and sports fields, and also as a material for sound absorbing and shock-absorbing coverings. Rubber dust is usually used for production of rubber mats. In addition, in recycling process steel and textile waste are also obtained. It is important to be aware that the process of recycling is very energy-intensive - about 125 kWh / 1 ton of tires and that it is accompanied by a large emissions of noise.

There are also research on using rubber as an admixture in a new type of asphalt surface. Some studies shown that such a new asphalt has better parameters than the asphalt produced by traditional methods. The vehicles moving on it, have shorter braking distance and emit less noise. Moreover, in the rain, the cars have better grip and the surface itself has great durability.

Taking into account all weaknesses of linear economy on one hand and opportunities of circular economy on other hands, there can be a few new business model identified. Such business models emerging in the market can somehow jeopardize the fundamentals of the linear economy and somehow they are worrying some of competing companies. There are three key new business model in circular economy:

- 1) **Remanufacturing and reuse** - it is based on a series of manufacturing steps acting on an end-of-life part or product in order to return it to „like-new” functional state and possibly better performance. Such remanufacturing processes are organized by start-up companies who are building their whole business around this approach and also global companies are using remanufacturing as part of their overall product. This model contributes to preserving energy embodied in products and to reducing production of new waste. The main benefits for companies are: reduction

of costs of raw materials, improved product lifecycle knowledge, improved profits, reduced negative environmental impact and also closer relationship with customers. Among industries in which remanufacturing, refurbishment or other reuse strategies are the most developed are: aerospace, automotive, ICT equipment, ink and toner cartridges, and textiles. Development of remanufacturing businesses is also connected with the organization of a reverse logistics system with different levels of renovation or refurbishment.

- 2) **Selling services rather than goods** - this model focus on the shift in business thinking from selling products to providing service solutions to customer needs - selling the function that the products provide not the product itself. This model as it becomes more popular, bring the changes in product design such as modular construction, use of biodegradable components and reduction of the number of different raw materials used in one product. It will also cause the necessary changes in the supply chains. The model provides customers with a high quality of products for the period they need it and moreover customers can avoid transaction costs of having to sell the products on the second-hand market. This model can be used for both brand new product but also for remanufactured products.
- 3) One interesting example is the Romanian company Getpony. It is a small company, started it 2015, that has developed an app which can be downloaded on smartphone. One can book a car, use it, pay 1 leu per minute, leave it whenever she or he finishes the job, the next citizen can use it, and the cycle resumes. The rate of payment varies depending on the model of the car and the duration of renting; the payment is made exclusively with the card. The investors started with an investment of 100,000 euros; in two years they have reached an investment of one million euros, and now they are trying to change the culture of urban transport in Cluj and Bucharest
- 4) **Sharing economy business model** - often called as a peer-to-peer (P2P) economy business model is a decentralized model whereby individuals interact to buy or sell goods and services directly with each other, without an intermediary third party. What is characteristic for this model is that acquiring and sharing access to goods and services are facilitated by a community based on-line platforms. The sharing economy business model utilizes already existing assets, whereas traditional businesses own the assets they use to provide services or goods. There are already many well-known platforms such as platform connecting drivers with passengers: Uber or BlaBlaCar or platform for renting private apartments: Airbnb; but there are constantly new players appearing on the market - also in Central and Eastern European countries. Very interesting and innovative examples are platforms created in Poland: Skilltrade platform for exchanging skills or Trejdoo - the money exchange platform. What drives this business model the most are economic benefits for consumers, thus societies can expect new community based on-line platforms in the coming years.

All of above models have a significant potential for increased economic, social and environmental benefits also in Central and Eastern European countries, however, further researches on a specific groups of products are needed.

The future of circular economy in Europe

More than ten years after the EU Waste Directive was approved, and two years after the adoption of EU Circular Economy Action Plan and creating the European Circular

Economy Stakeholder Platform which is a virtual open space aiming to promote Europe's transition to a circular economy by facilitating policy dialogue among stakeholders, European Union continue effort to transform Europe's economy into a more sustainable and restorative economy. In January 2018 the European Commission adopted a new set of measures, including:

- 1) EU Strategy for Plastics in the Circular Economy and annex to transform the way plastics and plastics products are designed, produced, used and recycled. By 2030, all plastics packaging should be recyclable. A Communication on options to address the interface between chemical, product and waste legislation that assesses how the rules o
- 2) n waste, products and chemicals relate to each other. A Monitoring Framework on progress towards a circular economy at EU and national level.
- 3) A Report on Critical Raw Materials and the circular economy that highlights the potential to make the use of the 27 critical materials in our economy more circular.

In April 2018, the European Parliament and in May 2018, The Council of Europe approved the EU's landmark Circular Economy Package (CEP). It is expected that new rules will make EU the global front-runner in waste management and recycling. The new waste rules include the key target for reduction of landfilled waste which must be 10% or less of the total amount of municipal waste generated, by 2035. It also includes more ambitious recycling targets as shown below in Table 1 and Table 2.

Table 1. EU CEP: Recycling targets for municipal waste (Directive of the European Parliament and of the Council, amending Directive 2008/98/EC on waste; PE-CONS 11/2/18 REV 2 Strasbourg, 30 May 2018)

By 2025	By 2030	By 2035
55%	60%	65%

According to new Circular Economy Package EU member states will be obliged to reach higher targets also for packaging waste:

Table 2. New recycling targets for packaging waste (Directive of the European Parliament and of the Council, amending Directive 2008/98/EC on waste; PE-CONS 11/2/18 REV 2 Strasbourg, 30 May 2018)

	By 2025	By 2030
All packaging	65%	70%
Plastic	50%	55%
Wood	25%	30%
Ferrous metals	70%	80%
Aluminum	50%	60%
Glass	70%	75%
Paper and cardboard	75%	85%

In addition, the Circular Economy Package encourages separate collection of hazardous household waste by 2022, bio-waste by 2023 and textiles by 2025. Moreover 30% reduction in food waste by 2025, and a 50% reduction by 2030 is expected. This equals the sustainable development goals set by the United Nations, however, other than the recycling and landfilling targets, these goals are not legally binding.

Furthermore, new legislation package determines stricter rules for calculating recycling rates and foresees more use of effective economic instruments and other measures in support of the waste hierarchy. Producers to a greater extent will be responsible for

their products when they become waste. In addition, mandatory extended producer responsibility schemes will have to be established for all packaging by 2024.

Despite determining higher and higher indicators regarding waste recycling - which are in fact late for decades - shifting to a circular economy is not a straight forward process. Circular economy is the approach which goes far beyond waste management, recycling and reuse of products. It takes a systemic approach to the vast flow of resources and waste through societies. It also requires substantial changes in the value chain, such as; adapted design of products, better water management, minimization of waste, reduction of consumption and creating products in a way they can be reused, repaired or recycled back into nature or the marketplace. Possibilities related to circular economy are recognized by many companies from the smallest SMEs to the biggest multinational companies and also by many other stakeholders. What is the most needed now and in the future is the shifting of attitude among the citizens and customers who can boost circular economy by their decisions and choices.

Conclusions

Current dominant linear economic systems result from existing educational system and in order to pursue the transition towards circular economy should be preceded by a change of the educational system. Due to the fact that circular opportunities may be lost at various stages in the lifecycle of a product, consumer education becomes particularly important because in developed countries losses are concentrated at the consumer level, whereas in developing countries, more circular opportunities are lost at the manufacturing stage.

The new the Circular Economy Package adopted by European Union represent the most modern waste legislation in the world. Now the move is on the side of the Member States, which have to implement new rules into their legal systems. However, a special challenge is therefore for the countries of Central and South-eastern Europe. Western European countries which are leaders in the field of waste management in can be examples for the countries of Central and South-eastern Europe. Circular economy in CEE countries has a chance to move from the side-lines into the mainstream, however there are some obstacles for circular economy and they include current product design patterns and cultural resistance.

Abstract. Capital markets have become one of the drivers of economy growth in frontier and emerging economies and Romanian case is no exception. Bucharest Stock Exchange is the second capital market in Central and Eastern Europe by the number of IPO successfully concluded in 2017 and is the sixth in terms of the largest return among world capital markets. In recent years, Romania's capital market has made significant efforts in order to upgrade to the emergent market status in terms of development of market infrastructure, increasing the accessibility and attractiveness of the Romanian capital market through listing of public and private IPO's. Our research is focused on a quantitative approach – content analysis, by taking into consideration the ratings of FTSE Russell and MSCI considering Romania's country classification. The results of our study indicate that despite the positive changes, Romania's rating as a frontier market implies a set of challenges that Romania must face in order to become an emergent capital market: free and well-developed equity market- market accessibility and facilities for international investors and liquidity. A very important criterion for Romania to achieve the emergent capital market status is represented by listing new public (such as Hidroelectrica and the National Company Bucharest Airports) & private IPO. The evolution of BET and BET-TR as compared with the evolution of CDS over 2007-2017 shows that BVB is very sensitive to the country risk, which also influences foreign capital investments.

Keywords: frontier capital market; emergent capital market; Bucharest Stock Exchange; economic growth; Romania.

Introduction

Capital markets have become one of the drivers of economy growth in frontier and emerging economies and Romanian case is no exception. Bucharest Stock Exchange is the second capital market in Central and Eastern Europe by the number of IPO successfully concluded in 2017 and is now sixth in terms of the largest return among world capital markets (PwC, 2018). Despite significant positive changes in terms of development of market infrastructure, increasing the accessibility and attractiveness of the Romanian capital market through listing of public and private IPO's, Romania will continue to be in 2018 a frontier market. This is due especially to the political and economic local context that on the long term can generate uncertainties or exposure to adverse business, financial, or economic conditions that could lead to the obligor's inadequate capacity to meet its financial commitments on the obligation (Standard &

Poor's, 2018). The evolution of BET and BET-TR as compared with the evolution of CDS over 2007-2017 shows that BVB is very sensitive to the country risk, which also influences foreign capital investments (PwC, 2018).

Our research is focused on a quantitative approach – content analysis, by taking into consideration the ratings of FTSE Russell and MSCI considering Romania's country classification. The results of our study indicate that despite the positive changes, Romania's rating as a frontier market implies a set of challenges that Romania must face in order to become an emergent capital market: free and well-developed equity market-market accessibility and facilities for international investors and liquidity. A very important criterion for Romania to achieve the emergent capital market status is represented by listing new public (such as Hidroelectrica and the National Company Bucharest Airports) & private IPO.

Frontier versus emerging markets: challenges and opportunities

"Frontier markets are among the fastest-growing economies in the world ... In essence, they are the emerging markets of tomorrow" (Rowader, 2015, p.2). Frontier markets are a subset of emerging markets, with lower market capitalization and liquidity or more investment restrictions than more established emerging markets, or both, depending on the country under consideration (Bond & Dyson, 2016, p.147). Being variously described as "emerging-emerging," "next-generation emerging" and "frontier" (EY, 2017) or "pre-emerging markets" are more volatile than other stock markets and are defined by greater social or political instability (Barclays, 2018).

When it comes to the most important opportunities for private equity industry to invest in frontier markets, we can distinguish the following features: 1) Less competition and access to largely untapped markets carries the potential to deliver significant returns with proven business models. Frontier markets contain niches of high economic growth - the opportunity to generate strong returns investing 'off the beaten path', often in assets that are under the radar or not part of the geographic remit of mainstream investors (*Financier Worldwide Magazine*, 2017); 2) Frontier markets tend to have little correlation either with developed markets or emerging markets and this can make them a possible portfolio diversifier (Barclays, 2018). This idea is also emphasized by Rowader (2015) that indicates that frontier markets offer growth potential and low correlations within markets and with other asset classes, along with relatively attractive valuations.

EY (2017) indicates a series of risks and challenges when determining which particular frontier markets to pursue for portfolio diversification: 1) *Regulatory and trading-execution risk* – such as foreign ownership restrictions, currency limits, local custody rules, local funding and registration requirements; also, some markets even require foreign market participants to execute trades via local brokers; 2) *Transaction costs*: high local transaction fees and commissions inflate trading costs; 3) *Currency risk*: investors that seek to build a frontier market portfolio need to be aware that they face a higher risk of investment exposure to potentially volatile currencies; 4) *Governance risk*: standards of corporate governance and financial reporting among listed companies in some frontier markets can be uneven; 5) *Sector and sovereign risk*: part of the attraction of frontier markets is their low correlation with developed and emerging markets. However, investors should be aware that frontier markets are dominated by a few sectors, thus a

sizeable allocation can result in concentrated exposures to certain sectors. Frontier market equities are highly exposed to sovereign risk. 6) *Liquidity risk*: illiquidity is a feature of many frontier markets. Investors may be unable to execute trades when they want, or at the size they want. Bid-offer spreads can also be relatively wide. 7) *Operational risk*: in some frontier equity markets, investing entails increased operational risk. Failed trades may occur more frequently than in developed markets, as settlement processes may be less standardized, less automated and more prone to errors. 8) *Political risk*: many frontier markets have fragile systems of government that can be prone to instability. Turmoil can in turn lead to rapid declines in the market value of securities traded in impacted countries.

J.D. Stanford (2009) defines emerging economies as developing economies that have adopted market-oriented policies and have established stock markets in order to obtain foreign capital to increase economic growth. The defining characteristic of emerging markets is that their economies are still very much in the development phase; they typically boast very young populations, a rising middle class and some, but by no means all, are enjoying robust levels of economic growth and industrialization (Barclays, 2018). The most important features of emerging capital markets are: High growth rates and potential to become developed economies in the mid/long term; A unique risk profile; Lower per-capita income, with differences in consumption behavior when compared to developed economies; Either untapped talent pools or are undergoing specialized labor shortages (e.g. Brazil); Transparency, market regulation and operational efficiency under development; Unique economic and political environments which are still stabilizing (PwC, 2013).

The most important limits of emerging capital markets are: high volatility, the existence of bubbles, panic, speculation, anomalies, high-risk investment opportunities, a low level of liquidity, reduced capitalization, strong correlation with developed capital markets, reduced number of transactions, insufficient development of financial instruments, exchange rate instability (Birău, 2012). Most of the emerging markets lack the institutional strength to take full advantage of an open capital account; this is due to weak financial supervision and poorly developed domestic capital markets (sudden changes in capital inflows may result in significant current account reversals, crises and currency collapses (Edwards & Garcia, 2008, p.2). The challenges for emerging capital markets regarding the availability, diversity and pricing of capital are emphasized by McKinsey Report - *Deepening capital markets in emerging economies* (2017, p.5): 1) *Significant funding gap* - Primary markets are more volatile and less reliable sources of funds for issuers in emerging markets; 2) *Limited choice*: Emerging market issuers lack options to diversify funding and to match funding with their needs. For example, the absence of a long-dated bond market reduces the flexibility of corporate borrowers to align funding structure with assets and future earnings; 3) *Expensive capital*: Issuers in these markets face a more volatile and higher cost of capital compared with developed markets. For example, they pay roughly a 120 percent higher real cost for debt securities.

In comparison with frontier markets, emerging markets could grow around twice as fast as advanced economies on average by 2050 (PwC, 2017). According to J.P.Morgan -*Long-Term Capital Market Assumptions Report* (2018) - despite outperforming in 2017, emerging market equities remain attractive. These points of view can be correlated with the following reasons: 1) *Global growth remains robust* - rates of growth have slowed

from their best levels in the first quarter, but the current pace of activity is still pointing to near double-digit annual gains in corporate profits; 2) *The dollar is unlikely to keep rising* - the U.S. dollar has reached a top for this cycle and could enter a multi-year bear market due to growing U.S. deficits and inflationary pressures; 3) *Commodities prices are going up* - Emerging market returns usually correlate with commodity prices. That hasn't happened this year, mainly because of surprising dollar strength, but it is expected that commodities and emerging markets to start trading more in sync as the dollar weakens; 4) *Capital spending is strong* - S&P 500 companies are continuing to spend on capital projects. That tends to benefit emerging markets, which often supply parts and raw materials for those projects; 5) *China-U.S. trade conflicts could be a benefit* - Long-term, no country wins from trade wars, but in the short-to-intermediate term, emerging markets could get a boost from any potential escalation in trade conflicts between the U.S. and China (Shalett, 2018). When it comes to emerging capital markets, Asia could dominate growth in global equity market capitalization over the next 10 years; at the same time, there is a rapid deepening of intra-regional bank lending, FX, rates and credit markets (Morgan Stanley, 2018).

Financial market development of Romania

Ioana Andrada Moldovan (2015, p.460) indicates that the real economy influences the market capitalization in Romania only on the short run, the financing function being performed almost exclusively by the banking system, while the capital market is small and does not fulfil properly the function of financing the real economy. When it comes to financial market development, The Global Competitiveness Report (2017) that comprised 138 countries - indicates that Romania was ranked 86 (with a score of 3.73), much lower than top 3 countries: New Zealand (5.79), Singapore (5.69) and United States (5.64). Top 5 most problematic factors for doing business in Romania are: access to financing, inefficient government bureaucracy, tax rates, inadequately educated workforce and corruption. The most important indicators of the Financial market development pillar from the Global Competitiveness Report (2017) that ranked Romania between 125-121 out of 138 countries are the aspects concerning financial services meeting business needs, venture capital availability, financing through local equity market and affordability of financial services (*see the figure below*):

8th pillar: Financial market development			
8.01 Financial services meeting business needs	125	3.4	
8.02 Affordability of financial services	121	2.9	
8.03 Financing through local equity market	123	2.8	
8.04 Ease of access to loans	110	3.1	
8.05 Venture capital availability	125	2.1	
8.06 Soundness of banks	90	4.4	
8.07 Regulation of securities exchanges	114	3.5	
8.08 Legal rights index 0-10 (best)	8	10	

Figure 1. 8th pillar: Romania Financial market development
(World Economic Forum, 2017, p.305)

When it comes to the economic development of Romania, Bucharest Stock Exchange has an important role due to the potential of attracting foreign investments: "Romania is now sixth in terms of the largest return among world capital markets and third in the European Union. Moreover, the Romanian stock market is one of the very few in the

entire world sharing consistency as regards the valuations of assets, being in `plus` also in three years' perspective backwards. The Bucharest Stock Exchange has come a long way from where it was five years ago and its continuing efforts to ensure the upgrade to the Emerging Market status are quintessential" (Sobolewski, 2017).

In the last years, the strategy of Bucharest Stock Exchange (2014, pp.4-11) has been focused on:

1) *Enlargement of the local investors' base*: The "Eight Barriers Removal" program served directly or indirectly the interests of local institutional investors, namely the pension investment funds;

2) *Enlargement of the individual investors' base*: initiatives relating to financial education (Investors Clubs, Fluent in Finance, Individual Investors Forums, Financial Expos, InvestQuests, Experts Call Center, Open Doors Day), to new transactional tools (ArenaXT), to the upgrade or release of new communication means (websites, mobile applications), to the creation of new market segment naturally dedicated to retail investors (AeRO), to the decrease of transactional costs and reliability of the dividends distribution and special schemes promoting day-trading (inactive);

3) *Transforming the BVB into a marketplace for financing of already listed issuers*: segmentation of the market, new indexes, including "total return" indexes", new obligations attached to the presence in the "premium" segments and for constituents of the BVB main index. Other initiatives that consisted of organizing investors' meetings with listed companies were arranged by the BVB, including a brand-new project of the "reverse road shows", engaging international investors coming to Bucharest.

4) *Transforming the BVB into a marketplace for financing of new companies*: BVB launched many initiatives aimed directly at potential new listings, both from the private sector and SOEs. The requirements for admission to trading of companies were simplified. Road shows and presentations involving candidates for listings and confronting them with potential investors, the creation of AeRO, are among them.

5) *Enhancement of intermediaries' efficiency*: Partnerships with brokers-members of the BVB in several educational and marketing-intense initiatives, new instruments designed for the brokers (market-making revenue schemes, issuers' market making), instruments giving outreach to retail clients (ArenaXT platform on mobile devices), institution of Authorized Advisors – marked the new approach of the BVB which consisted of real support given to brokerage industry. This line of actions will be continued and intensified;

6) *Modernizing the market infrastructure to face challenges and opportunities*: The most relevant envisaged the separation of trading and post-trading systems, the increased flexibility of settlement on gross basis, the T+2 implementation, and the introduction of two settlements cycles. The trading environment got improved with new market making programs, reduction of suspension from trading, elimination of the Odd-lot market, new tick size, new trading hours and new market stage, implementation of the auction models. The trading tools brought mobile apps and ArenaXT platform enhancements (Bucharest Stock Exchange, 2014, pp.4-11).

Ioana Andrada Moldovan (2015, p.447) indicates that "the development of capital market is a sine qua non condition for modernizing the Romanian economy, by increasing funding potential and enhancing competition in the financial market". The author claims the need for government support and recommends economic policy measures in order to accelerate financial market's expansion in the Romanian economy.

Discussions

At present, Standard & Poor's credit rating for Romania stands at BBB- with stable outlook (Trading Economics, 2018). An obligation rated 'BB' is less vulnerable to nonpayment than other speculative issues. However, it faces major ongoing uncertainties or exposure to adverse business, financial, or economic conditions that could lead to the obligor's inadequate capacity to meet its financial commitments on the obligation (Standard & Poor's, 2018). "The advance of the Romanian economy, focused on consumption, could generate wide external fiscal deficits and could increase the vulnerability of Romania's economy to a sudden drop in activity in the medium term. However, Romania's level of public and external debt is modest and the economy growth could remain solid for a considerable period of time" (Romania Insider, 2017).

When it comes to the FTSE Russell classification, Romania that was added to the Watch List in September 2016 for possible reclassification to Secondary Emerging market status from frontier markets, doesn't meet the criteria. Despite this, FTSE Russell acknowledges the efforts of the Bucharest Stock Exchange to bring IPOs to the market and to improve liquidity levels on the exchange (FTSE Russell, 2018, p.6). The indicators taken into consideration are: 1) *Quality of Market* – the quality of regulation, the dealing landscape, custody and settlement procedures, and the presence of a derivatives market would all be taken into account; 2) *Materiality* – a country needed to be of material size to warrant inclusion in a global benchmark; 3) *Consistency and Predictability* – a pathway to classification changes would be set out by announcing a "Watch List" of countries that were being considered for promotion and demotion as well as the criteria by which countries would be judged; 4) *Cost Limitation* – the cost of implementing a change would be taken into account when assessing a market for promotion or demotion; 5) *Stability* – a phased approach would be taken to the introduction of new countries; a new country would only join as an emerging market; and promotion would only occur in response to permanent changes in market status and global acceptance; and 6) *Market Access* – international investors should be able to invest and withdraw funds in a timely and secure manner at reasonable cost.

The main criteria that Romania doesn't meet are: *Free and well-developed equity market, Custody - Omnibus and segregated account facilities available to international investors, Liquidity - Sufficient broad market liquidity to support sizeable global investment and Off-exchange transactions permitted*. "An important criterion to be achieved is liquidity adequate to the implementation of large international investment," and in practice refers to the need to attract new companies to increase capitalization, free float and consequently share trading. Information is read as a harbinger of promotion of Romania to the "Watch List" by the international rating institutions" (Carpathia Capital, 2017). In comparison with Romania, Saudi Arabia (also included in the watch list from 2016) and Kuwait (included on the watch list from 2008) will be reclassified from September, respectively, December 2018 to Secondary Emerging Market Status (see the figure 2).

The MSCI Market Classification Framework (2018) consists of following three criteria: economic development, size and liquidity as well as market accessibility (see the figure 2). Romania is included by Morgan Stanley Capital International in the category of frontier markets. The MSCI Romania Index is designed to measure the performance of the large and midcap segments of the Romanian market; with 5 constituents, the index

covers approximately 85% of the Romania equity universe: Banca Transilvania, S.N.G.N Romgaz, OMV Petrom, BRD Group Societe Generale and Electrica.

Developed	Advanced Emerging	Secondary Emerging	Frontier

			Tunisia
			Vietnam

Figure 2. FTSE classification of markets
(Source, FTSE Russel, 2018, p.1)

The most important sectors in terms of market capitalization are: financials (52,69%), energy (39,67%) and utilities (7,64%). According to MSCI (2018), Romania is included in the category small frontier, along with countries such as: Morocco, Argentina, Sri Lanka, Nigeria, Oman, Bangladesh, Croatia, Ivory Coast, Slovenia, Kazakhstan, Tunisia, Vietnam and Mauritius (MSCI, 2018). The main challenge for Romania in becoming an emergent market is low liquidity. In order for Romania to reach the status of emerging market it must comply with the following aspects: 1) *Size & Liquidity Requirements* – Number of companies meeting the Standard Index Criteria must be 3; company size: USD 1260 mm/ security size: USD 630 mm; security liquidity – 15% ATVR; 2) *Market Accessibility Criteria* – openness to foreign ownership & ease of capital inflows/ outflows – must be significant; Efficiency of the operational framework must be good and tested; Stability of the institutional framework – Modest (MSCI, 2018).

Figure 3. MSCI ROMANIA INDEX (USD)
(MSCI, 2018, p.1)

BNR (2017) indicates that the capital market posted an upward trend in 2017. The index of the top 13 most liquid shares listed on the Bucharest Stock Exchange, namely the BET, reached a nine-year peak in May 2017, followed by a slight correction in 2017 Q3, on the backdrop of uncertainties regarding the future of the Pillar II (private pensions). Nevertheless, the rise in the BET index was below the benchmark indices of the Hungarian and Polish stock markets, yet above the European average. In terms of volatility, evolutions on the Romanian capital market exceeded those recorded by some more developed markets.

January 2017 through September 2017, the most significant dynamics were posted by the BET-FI index, which increased by 26 percent in the first three quarters of the year compared with end-2016, followed by the BET-BK and BET-XT-TR indices, while the sectoral index for utilities, the BET-NG, decreased slightly starting with the second half of the year. Moreover, in August 2017, the average traded value of listed shares was 38 percent higher year-on-year. In order to support portfolio diversification, the local stock exchange could attract new companies to contribute to lowering sectoral concentration, while increasing representativeness in relation to the national economy (BNR, 2017, p.117).

Romania still aspires to advance from the status of frontier capital market to that of emerging market with increased visibility among the investors and implicit benefits in terms of depth and liquidity. In this regard, ASF (2014) developed *STEAM project – Set of Actions Toward Establishing and Acknowledgement of the Emerging Market Status* - a priority project the development of the capital market and its inclusion in the category of emerging market. The set of measures proposed through the STEAM Project are: increasing the accessibility and attractiveness of the Romanian capital market; streamlining financial instrument borrowing and short selling transactions; development of the primary and secondary local market of bonds (municipal and corporate); increasing liquidity and attracting new investors; increasing the visibility of the Romanian companies listed on the capital market, by listing them on other markets; increasing the implementation of corporate governance principles at the level of issuers, intermediaries, market operators, depositories, etc.; improving the accounting system of regulated and supervised entities - by aligning with IFRS.

Figure 4. Market shares of sectors listed on the BSE & Dynamics of key stock market indices in the region (Source: BNR, 2017, p.118)

By now, BVB and ASF have improved the legislation through public bills (such as Alternative Investment Funds, Financial instruments etc.), modernization of the capital market infrastructure (merger of BVB and SIBEX, DC reauthorization, CCP in progress), development of bond market, increasing the number of emitents (transfer of the companies from RASDAQ on the principal market or ATS), programs of financial education (Negrițoiu, 2017). An important criterion in order for Romania to achieve the status of emergent market that by now hasn't been attained is represented by public IPO's: Salrom, Hidroelectrica and National Company Bucharest Airports listing are very important for 2018 (Țințeanu, 2018). STEAM project also implies listing other national companies where the state has majority shares such as Distrigaz Sud – GDF and Distrigaz Nord – E.ON, according to ASF (Negrițoiu, 2017).

Despite the significant initiatives taken by BVB and ASF through the STEAM project, liquidity remains an important challenge for the Romanian capital market and affects directly the market efficiency; it is not efficient in light of the fact that the stock price changes can be forecast (Oprean, Tănăsescu & Bucur, 2017, p.1680). The evolution of BET and BET-TR as compared with the evolution of CDS over 2007-2017 shows that BVB is very sensitive to the country risk, which also influences foreign capital investments (PwC, 2018, p.4).

Conclusions

Romania – BVB and ASF- has made significant improvements in order to upgrade from frontier to emergent market status: *Enlargement of the local investors' base*: The "Eight Barriers Removal"; initiatives relating to financial education (Investors Clubs, Fluent in Finance, Individual Investors Forums, Financial Expos, InvestQuests, Experts Call Center, Open Doors Day), to new transactional tools (ArenaXT), to the upgrade or release of new communication means (websites, mobile applications), to the creation of new market segment naturally dedicated to retail investors (AeRO), new indexes, including "total return" indexes, new obligations attached to the presence in the "premium" segments and for constituents of the BVB main index; launched many

initiatives aimed directly at potential new listings, both from the private sector and SOEs; the separation of trading and post-trading systems, the increased flexibility of settlement on gross basis, the T+2 implementation, and the introduction of two settlements cycles. At the same time, the Romanian stock market recorded one of the highest dividend yields in the world in 2016 and 2017. BET total return index, which includes the dividends granted by the blue chips listed on BVB has increased by over 19% in RON terms in 2017 (PwC, 2018).

Despite the positive changes, Romania's rating by FTSE Russell inclusion in the Watch List and MSCI as a frontier market indicate the main challenges that Romania must face in order to become an emergent capital market: market accessibility and facilities for international investors, development of market infrastructure and liquidity. The evolution of BET and BET-TR as compared with the evolution of CDS over 2007-2017 shows that BVB is very sensitive to the country risk, which also influences foreign capital investments (PwC, 2018). Although the initiatives taken by BVB and ASF through the STEAM project are significant, liquidity remains an important challenge for the Romanian capital market and affects directly the market efficiency. A very important criterion for Romania to achieve the emergent capital market status is represented by listing new public & private IPO.

In order to accelerate change, Romania must continue the development of the capital market infrastructure, "so that it can offer a range of services that support financial institutions, companies, governments and investors in building businesses and contributing to growth in the wider economy" (McKinsey, 2017, p.6).

Abstract. *This paper addresses the chances of upgrading to the status of an Emergent Market of the Romanian Capital Market, and what actions can be taken in order to achieve this goal. In this regard, the objectives of the paper are to establish an understanding of both the capital market in Romania and what it means to include companies in the MSCI-Morgan Stanley International Index. In this respect, the hypothesis of the research is that Romania has the potential to upgrade to the Emergent Market status given that at least three companies meet the minimum requirements, including those related to the Annual Traded Value Ratio proposed by the MSCI. Following a technical analysis using the MSCI methodology, it was found that the hypothesis is confirmed as three companies meet the ATVR target of at least 15%, such as Romgaz, Banca Transilvania, BRD Group Societe Generale except for OMV-Petrom, which only reached 12.62%. The company needs 19% of the total volume of the total stock market to bring the ATVR level to at least 15%, or USD 1,017,050,098. It can also be said that BRD Group Societe Generale should increase the Free Float market capitalization by 1.0534% that should reach the minimum required by MSCI USD, 763mln. By increasing offer through listing more companies on the Bucharest Stock Exchange and increasing demand through attracting retail investors, trade volumes will grow consistently. Also deepening the financial market, liquidity increases facilitating the decreasing of, trade interests and prices leading the Romanian capital market a little bit less expensive. Data was collected from Bucharest Stock Exchange, Trading Statistics section, and daily reports. The methodology has two stages. As a first stage we establish the Annual Traded Value Ratios for 12 months (ATVR 12M) and ATVR for 3 months (ATVR 3M) for each company. The companies are Romgaz, OMV-Petrom, Banca Transilvania, and BRD-Group Societe Generale and the study case in the paper was be OMV-Petrom. During the analysis was elaborated by taking into consideration the MSCI Methodology. The second stage of calculations includes we find out what is the percentage of the total Market Volume that would lead key MSCI OMV-Petrom to increase its ATVR to 15%-minimum level imposed.*

Keywords: *Morgan Stanley Capital International; ATVR-Annual Traded Value Ratio; Upgrading to the Emergent Market Status; Market Capitalization (Mcap); Free Float; Market Capitalization Free Float (Mcap FF); OMV Petrom; Monthly Median Traded Value(MTVR); Traded Volumes; trading; Retail Investors.*

Introduction

The present paper aims to study the conditions for upgrading from Frontier Market to the status of Emergent Market. Also it is an objective to follow the evolution of a company that has a real potential to fulfill the conditions for inclusion in the MSCI watch list. This theme was also chosen because the Bucharest Stock Exchange is a strategic hub that links important bridges between individual investors and listed companies (a strategy that is worth analyzing). Such a paper was undertaken to develop an understanding of how to think long-term strategies that favor the development of the Romanian capital market. At the moment, the capital market is an opportunity for those who develop their business and for individuals who want to invest in the stock market. BSE is the most important representative of the Romanian capital market and operates on two markets: the regulated and the junior, AeRO. The AeRO Market provides trading opportunities for SMEs and was launched on February 25, 2015. Bucharest Stock Exchange's revenue is generated by three business sectors such as post-trading services, registry services and trading services. The Bucharest Stock Exchange is one of the stock markets that, although it has an impressive growth in the total capitalization of 20 billion euros, has a trading level that does not have an equal regional performance. The shareholder structure currently shows that around 72% of legal entities hold shares, and around 13% are individuals with shares. The most important institutional shareholder are NN Private Pensions Group, SIF Transilvania and EBRD. Following the 2016 September success of being included in the FTSE Russel watch list, Romania continued its major ambition to upgrade to the status of an emergent market by marking its presence on the MSCI and other important international indices like S&P. Trading volumes remained below market potential. The transaction costs are higher compared to other regional peers due to lower trading volumes, which makes it essential to adopt measures that stimulate the capital market performance by attracting retail and institutional investors.

There are both quantitative conditions imposed by MSCI, such as a stock market capitalization of \$ 1,375bn, Free Float market capitalization, recognized as Mcap Free Float of \$ 763m and a 12/month annual trading rate (12M-Annual Traded Value Ratio) of 15%. At least three companies must be listed on the watch list to bring the capital market to the next level. In addition to the quantitative conditions imposed by MSCI, there are also qualitative conditions that the Romanian capital market has to optimize. These refer to the level of trading, securities lending and regulatory transferability. The merger with the Derivative Stocks Exchange SIBEX boosted the overall market capitalization of the BSE. This led the Bucharest Stock Exchange onto a stronger position on the capital markets in relation to regional peers. Bucharest Stock Exchange is remarkable through its financial and investment education platforms, its own capabilities and various opportunities that attract retail investors.

Once upgraded to Emerging Market status the benefits lead to the increase of the value of the investments compared the frontier markets. Also due to increased demand the companies' EBIT/EV multiples will improve resilience to economic changes will be consolidated. Once volumes have grown from this perspective, trading fees may decline, better positioning the capital market among regional peers.

Methodology

In order to understand the evolution of the transition to the emerging market status, four companies were analyzed from the level of medians traded between January and December 2017, the ATRV annual traded values ratios (at 12 months and 3 months). The analysis was based mainly on the MSCI specific methodology for January -December 2017. The hypothesis states that Romania has the potential to upgrade to the Emerging Market position given that at least three companies meet the conditions, including those related to the annual trading rate, (Annual Traded Value Ratio) required by MSCI. The technical analysis has gone through several stages, after data collection. The daily traded values and prices of ROMGAZ (SNG), Banca Transilvania (TLV), BRD-Group Societe Generale BRD and OMV Petrom (SNP), were collected from the BSE website. Then the values were turned into US Dollars, because all indicators are calculated in US Dollars, as proposed by MSCI.

First we calculate the ATVR 12M and ATVR 3M for each company using MSCI methodology.

According to MSCI, Free Float (FF) SNP 20%. (BVB, 2017)

FF Market Cap is calculated using the last price in that specific month * number of securities issued * 0.2 (FF)

(Median Traded Value, MTV)

We calculate the monthly median traded value = *Median Traded Value (USD)* * number of traded days within that month.

$MTVR = \text{Monthly Median Traded Value} / \text{FF Market Cap}$

$ATVR_{12M} = \text{Average } (MTVR_{i=1,12}) * 12 \text{ (Jan2017 - Dec2017)}$

$ATVR_{3M} = \text{Average } (MTVR_{i=1,3}) * 12 \text{ (MSCI,2017)}.$

Second, an adjustment will be made to the total volume of the market so that as much as one percent of the total volume of the market would imply OMV Petrom (SNP) to reach at least 15% ATRV annual trading level. To do this, MS Excel we will fine tunes a percentage multiplied with the daily traded values throughout the year until we would reach at least 15% ATRV on OMV Petrom. Then multiply the % to the overall volume of the whole market and find %* daily traded values and %* total market volume.

Based on the technical analysis, the results of the ATRV and Market Capitalization (Mcap FF) calculations of the companies will be presented in the form of technical tables. Overall, the methodology has two parts. First is the technical analysis of the most important levels of Mcap, Mcap FF, ATVR 12M, ATVR 3M of Romgaz (SNG), Banca Transilvania (TLV), BRD-Group Societe Generale, OMV-Petrom (SNP). The second part will determine what percentage of the total volume of the market would imply OMV Petrom to reach the ATVR target of 15%. To confirm the hypothesis that Romania has the potential to update to emerging market status, specific calculations of the MSCI index methodology have been performed.

Results

In order for the Romanian financial market to become an Emerging Market, according to MSCI, minimum three companies must meet the minimum 15% ATRV-Annualized Traded Value, Ratio, Free Float market value of at least 763 million USD and 1,375 million USD. A technical analysis has been made for four companies that have the

potential of being included on the MSCI Emergent Markets, Romgaz, Omv Petrom, Banca Transilvania and BRD Group Societe Generale. As far as the Mcap FF and Mcap levels are concerned, almost all the companies analyzed meet the quantitative conditions imposed by MSCI. Romgaz (SNG) and Banca Transilvania (TLV) only exceed the annual traded value ratio. Following the raising of the Free Float Mcap standard from \$ 635 million to \$ 763 million in 2018, it can be noticed that BRD Group Societe Generale (BRD) does not meet the Market Capitalization Free Float capture condition, as it reports a value of USD 724,3 mio. In order to meet the MSCI condition BRD should increase its Mcap FF by 1.0534%. This was calculated by dividing the minimum imposed by MSCI to what actually BRD reported as Market Capitalization Free Float. Following calculations consistent with the MSCI methodology, OMV-Petrom reached, a 12.62% annualized ATRV value, which means it does not reach the standard imposed by MSCI. With OMV Petrom as a case study that did not reach at least 15% of the ATRV it was revealed what percentage of the total market volume would cause OMV Petrom to achieve a 15% ATRV minimum. Following a calculation, it was confirmed that 19% of the total volume increase of the market would cause OMV Petrom's ATRV to reach at least 15% and a volume of RON 4,017,347,887lei equivalent of USD 1,017,050,098. Even if OMV Petrom does not meet a 15%, it has the potential to be included on the MSCI Emergent Market Indices, with the Mcap and FF way above the required minimum. Given that at least three companies surveyed meet the conditions of MSCI, including ATRV 12M and ATRV 3M, it can be said that the hypothesis that Romania has the potential to upgrade to the emerging market position given that at least three companies meet the conditions, related to the annual trading rate is confirmed.

OMV-Petrom (SNP)

OMV-Petrom registered on the Stock Exchange under the initials of SNP, is the most important industrial and industrial group for gas and oil extraction in Southeastern Europe, being an industrial leader in Romania. OMV Petrom is doing business on three operational sectors namely Downstream and Upstream oil and gas. OMV Petrom's portfolio in Romania and Kazakhstan holds reserves of 566 million Bep (1P) and hydrocarbon production of about 61 million boe in 2017 (of which 3.8 million tonnes of crude oil and natural gas and 5.2 billion cubic meters of natural gas). The downstream oil downstream sector contains the Petrobrazi refinery with a capacity of 4.5 mn tons per year and processes the crude oil of OMV Petrom. This operational segment also includes a network of 786 gas stations located in Serbia, Bulgaria, Romania and Republic of Moldova (OMV Petrom Annual Report 2017). The power stations are operated under the two brands, OMV and Petrom. In total, the downstream oil downstream sector produced 5.1 million tons of refined product. The Upstream gas industry is the only company and also a gas sale and purchase channel. In 2017 there was a sales volume of 51.4 TWh (of which 45.3 TWh was sold to third parties). In 2017, the gas portfolio covered 860 MW power plants at Brazi and 45 MW, such as the Dorobantu wind farm, which produced 2.7 TWh of electricity. At the end of 2017, the wind farm has completed the sale of Dorobantu Park to keep Petrom to its initial strategy through its specific activities. The OMV Petrom Group is currently an important international player for gas and oil representing OMV Aktiengesellschaft, the OMV holding company, which is among the most important listed companies on the Vienna Stock Exchange. The Romanian State through the Ministry of Energy holds 20.64% of the shares of OMV Petrom. According to OMV Petrom report, the companies listed on the Vienna Stock Exchange hold 51.01% of the group. The Property Fund holds 9.99% and the remaining 18.35% is the free float

other shareholders trading in the shares on the Bucharest Stock Exchange and Deposit Certificates, Global Receiver Receipt (GDR) on the London Stock Exchange, London Stock Exchanges. Following the privatization, the company's position strengthened on the oil and gas market. This was favored by a modern strategy, which was supported by investments of over 13.5 billion EUR over the last 13 years during which it contributed to the stability base in the Romanian economy in quality as an energy supplier and by attracting more employees and contributing heavily to the state budget. The company's efficiency strategy favored increasing the value of the company for potential customers by improving customer experience and satisfaction.

Optimizing the company's performance through the new strategy has meant a smaller number of engagements than in the previous year, 2016 for example from 15,288 employees to 14,210. In order to improve the satisfaction of OMV Petrom's employees, the main objective was to reduce the rate of injury. The Company also sought to reduce water intensity and greenhouse gas emissions. With increased performance, the company's profit amounted to approximately EUR 1.1 billion for the period 2012-2017. Operational year 2017 OMV Petrom generated profit from the Upstream and Downstream gas and oil sectors, worth RON 27,599.76. OMV Petrom managed to increase its profit before tax to 2,904.12 compared to the previous year when it generated 1,264.93 RON. From the perspective of its potential to reach the MSCI watch list it the company's financial performance comes not only from a well thought strategy of operational optimization the sectors but also from the 51.01% by the Austrian parent. This favored an optimized performance leading to a rise in the company's stock prices. Following a technical analysis, it is clear from the total volume of the entire market, the annual turnover of USD 1,017,047,087 billion is required to reach RON 4,017,347,887. A fall in prices would devalue OMV Petrom's position (SNP) against the conditions imposed by MSCI. Concerning the upgrade to emerging market status, it can be argued that while OMV Petrom is the only company that has not reached at least 15% ATRV 12M, it reported the highest total market capitalization, compared to the other companies analyzed, 4,837,406,852 million USD. Also, the company surpasses BRD Group Societe Generale in what it needs to capitalize on the Free Float market, Mcap FF-967,481,370 USD.

Banca Transilvania (TLV)

With a streamlined strategy, TLV has increased the volume of transactions and has stimulated the use of banking services by lowering customer tariffs, so that its market share has risen by 7.07% in 2017 compared to the previous year. According to the Banca Transilvania Report the number of customers increased from 2.27 million to 2.43 million. Customers of Transylvania Bank are classified as individual users, small and medium-sized entrepreneurs, medium and large corporations and micro business owners. Most of the users of banking services are considered to be small and medium enterprises, at a rate of 14%. In 2017 the volume banking transactions at Banca Transilvania increased by 20%, taking into account that 40% of the newly established companies in Romania decided to cooperate with this bank. The bank report reveals that more than 937 thousand customers use the internet banking application. The end of 2017 shows a 6.03% increase in the number of traded shares. It can also see a 14.60% increase in capital investment. Total assets of Transilvania Bank amounted to RON 59,302,095, equivalent to USD 15,013,188.61 million. The Bank's net profit is RON 1,185,979, up by 3.46% as compared to 2016. The net profit of the BT Group is RON

1,242,031, up 2.74% over the previous year, according to (Banca Transilvania Annual Report, 2017). The company's growing financial and operational trend can lead to the explanation of the optimal levels of total and free float market capitalization, along with the 12-month and 3-month annual turnover rate that reach the MSCI rates so Banca Transilvania meets the conditions to be included in the Emerging Market Universe by MSCI.

Compared to the other companies analyzed, it is the only entity that does not have a major shareholder, which makes the Free Float trading space at 70%, so it holds the largest number of nominal shares 4,341,439,404 compared to OMV Petrom 56,644,108,335 and Free Float 20%, BRD 696,901,518 shares and Free Float 30% and Romgaz 385,422,400 shares, Free Float 30%. Taking into account that Banca Transilvania does not have a main shareholder, it is worth noting the capitalization of the Free Float market, which reaches USD 2,164,381,200, which is the highest in comparison to the other analysed companies.

Sector benchmark

The companies surveyed focused on three main sectors in the Romanian economy: Oil-energy OMV-Petrom, natural gas-energy, Romgaz and the financial sector Banca Transilvania and BRD Group Societe Generale. When it comes to company investment decisions, a sector-by-sector perspective can be relevant and display the potential of companies. To make the analysis, we can consider the multiples of value that represent the ratio between the price per share and the earnings per share. In 2017, total stock market capitalization increased 20% more than in 2016 and was estimated to reach 14% attributable to the growing number of new listed companies and 6% attributable to organic business growth. This increase provided a total capitalization of over RON 90 billion. The sectors with the highest EV multiple were 9%, the electricity sector, 35% the financial sector and 40% the oil / gas sector. Although value multiples are high in oil and gas companies, profitability was among the lowest. The same cannot be argued in the financial sector that has shown a high profitability. This is also reflected in the financial sector that has reported multiple value in the past 5 years at the lowest level compared to gas and oil companies. This relationship between EV/ multiples and profitability may cause some confusion, when the analysis is actually made from the perspective of companies' evolution over the last 5 or 11 years, because that is how volatility or vulnerability can be traced to economic cycles. The 11-year Price Waters Coopers (PWC) survey shows that in the financial sector it is noticed that it was affected by the recession. It was also confirmed that the most volatile sectors in economic cycles were the financial sector itself, which shows the discrepancy between multiple value and profitability. It is also confirmed that the value multiplier is a relative value, which may suggest that if Price/earning (PER) is less, the price of the action may be optimal. This aspect can be considered relevant to investors when considering a medium-term business. For example, according to the PWC (2018), although PER for the financial sector was 9.3, compared with the oil and gas sector 11.7, the profit margin for financial companies was 44% compared to oil and gas companies 13%.

The most resilient sector in the economic phenomena seems to have been the oil and gas sector. For the period 2009-2016, the PWC analysis shows that the least affected by the progress of industrial production were multiples of value for the energy sector. PER negative, -0.34, multiple EBITDA 0.27 and 0.26. Compared to the energy sector, the

financial sector reports a more significant correlation between service evolution and financial multiples, showing a PER 0.27, multiple total assets 0.30 and value of 0.55 (PWC, 2017). It can be noticed that in companies reactive to economic cycles the prices of companies rise in economic growth and decrease in recession. As a 2018 perspective, the energy and oil sectors will be influenced by the regulations in early 2017 that could lead to an increase in gas or oil prices, which, on the one hand, may promote profitability but, on the other hand, may affect operators and distributors according to PWC. Consequently, there is primarily an inverse correlation between margin and multiple EBITDA. This correlation indicates that both in industrial and financial terms, multiple fall into complicated economic contexts. The analysis of companies' multiples of money undergoes changes in economic contractions, indicating the dependence of investor perceptions on country risk, which determines the evolution of investments (PWC, 2017).

It can be mentioned that although the Romanian capital market reports steeply increasing figures over the past years, it still remains a rather more expensive market compared to the bigger peer markets, despite the decrease of the fees in the last years. According to Concorde (2017) starting from the low level of trading on the stock exchange, it can be argued that the value of the companies and their performance is below potential which determines the prices of the shares to be undervalued. In other words, in order for stock prices to be smaller, better performance of listed companies is needed, and an increase in the level of trading that can help boost liquidity. To reach the impact, it would be necessary to deepen the financial market by increasing trading volumes. One of the recommendations is to improve the architecture of the capital market to allow the increased of supply and demand. Bucharest Stock Exchange aims to relaunch the derivatives market. In 2018, the BVB will change its price-limiting mechanism by implementing a new volatility control module that aims to optimize the quality of the financial market. The stock market aims to launch a new version of an online trading platform that includes new financial trading instruments and attracts new investors and market participants. To increase demand, roadshows investors will be organized to increase awareness about the local capital market performance and development. Investors from different centers like Prague, London, Vienna, Warsaw, Stockholm, Tallinn and other large centers will be visited. The efforts of the Bucharest Stock Exchange to develop the local capital markets, should be supported by all market participants and key economic decision makers. This will lead the entire country to develop better and faster. Another recommendation is to further develop financial education and investment through educational platforms such as fluentinfinate.ro. Also restarting the listing process for big state owned companies such as Hidroelectrica and Bucharest Airport will increase chances to upgrade local capital market to Emerging Market status. If reached this upgrade, this might lead to the biggest economic performance of Romania after EU accession. This implies that the Romanian stock market can be upgraded to emerging market status if macroeconomic indicators tend towards optimal financial stability and predictability that attract foreign investment. Listed company's evolution alongside other regulations on financial reporting and corporate governance are associated with country perspective that influences equity investment. Country perspective is associated with both the ability of companies to pay their debts to partners or the state, as well as the ability to transparently report information in line with international financial reporting standards.

Conclusions

There are listed companies that demonstrate the ability to contribute to the upgrading of the Romanian capital market to Emerging Market status. This already places the Romanian capital market closer to the big European capital markets, thus increasing the confidence among many investors, both institutional and retail investors regarding the good perspectives of the Romanian capital markets.

THE SOCIO-ECONOMIC LIFE OF THE INHABITANTS OF STANISLAVOV DURING THE FIRST WORLD WAR

Adam Adrian OSTANEK

Military University of Technology

2 Urbanowicza St., 00-908 Warsaw, Poland

adam.ostanek@wat.edu.pl

Abstract. Every war is a specific period in the area of social and economic life of people and cities. The ongoing fights always destroy both infrastructure and crops. This, in turn, translates into a reduction in the ability to conduct any business activity, as well as affects the increase in prices and impoverishment of the society. All of this in turn affects the public mood and the widely understood state of security in a given area. The Great War, as the World War I was then called, was the first global military clash between two significant military-political blocs. Its economic effects were extremely large for Europeans, regardless of the country. Everywhere, it triggered inflation, the rationing of basic necessities and the need to co-finance armaments by citizens. However, not everywhere, the course of the war and its economic consequences were identical, which resulted even from the fact of the existence or non-existence of the phenomenon of occupation. This article is intended to show what economic consequences are caused by war and occupation in micro-regional terms. The main re-search problem is the analysis of the social and economic life of the population of the third largest city in the province of Galicja, Stanislavov (Austro-Hungarian Empire), during the First World War. For this reason, the then state of industry, the level of development of trade and services, and the devastating impact of military activities on the economic progress of the city and its residents were analyzed. The article also draws attention to the process of gradual impoverishment of inhabitants resulting from the ongoing military operations, lasting for long periods of occupation and orders issued by the occupation administration that focused on plundering state assets belonging to the Habsburg Empire and charging the population with the costs of maintaining the occupation army. At the same time, the initiatives of the civil (au-tochthonous) city authorities, which sought to counteract all the negative effects of the occupation, were pointed out. The work is characterized by a chronological-problem approach to content. The initial conquest is the outbreak of World War I, and the final end of the war in November 1918. The source basis of the article are archival materials collected in the State Archives of the Ivano-Frankivsk Region in Ukraine, compact publications and articles, as well as materials posted on the Internet.

Keywords: First World War; Stanislavov; safety; defense; industrial enterprises; food-stuffs; trade establishments; services; speculation.

The First World War brought suffering and destruction to Stanislavov, which was in a whirlpool of world geopolitical changes. After that, the level of socio-economic life of the city was declined by destruction during military operations and by three Russian occupations (from September 3, 1914 to February 20, 1915, from March 4, 1915 to June 8 in 1915, from September 11, 1916 to July 24, 1917), and the safety of the inhabitants was under great threat. In the first days of the war, Austrian troops, which were constantly dislocated in Stanislavov, began to search for "traitors" of the empire and disclose the Russophile movement.

Austrian authorities did everything possible to ensure peace in the Habsburg Empire. Back in July 1914, Stanislavov, along with Lviv, served as a forward evacuation point (DAIFO, ф.п. 909.1.1186, p.4).

Immediately after the arrival of the Russian army in the city, the "Regulations of the Commandant of Stanislavov" dated September 5, 1914, were posted on the streets, determining the life of the city under Russian occupation. They also determined the timetable for the work of all enterprises of trade and services. Thus, grocery stores were supposed to open 6:00 am or 8:00 am, and closed at 8:00 pm. Restaurants and cafes could be opened until 10:00 pm. Certain permits were received only by the cafe "Under the Golden Eagle" P. Rubin and "Edison" P. Ferber, which could work until 2:00 am, as well as the restaurants of M. Gavbenshtok, A. Stigar, I. Shmid, P. Knizhat-ka, Ф. Malashinsky, K. Schweisser and the cafe: "Union" by V. Krovitsky and "Aus-tria" P. Belle, which could receive visitors (mostly Russian military) by 4:00 am. Such measures were connected with the institution of martial law, which was aimed to maintain order and protection in the city in time of war. All employees of trade were obliged to accept Russian money at the rate of one ruble to three silver Austri-an crowns. It was strictly forbidden to sell or let soldiers consume alcohol (DAIFO, ф. 636.1.4, p. 1). Also, the above-mentioned decisions prohibited thefts, the offenders were punished by a martial court, and in some cases were punishable by death penal-ty. The city's population had to fulfill its previous obligations, and refer it with "full respect and honor" to the Russian army.

Note that the prohibition on the sale of alcohol to the lower ranks of the Russian army was ignored by Jewish entrepreneurs, and already on October 5, 1914 the Rus-sian government was to post in the city announcements about the ban of Jews, through drunken soldiers, who sell alcohol (DAIFO, ф. 636.1.4, p.9).

In order to calm the local population September 11, 1914 the occupation authorities promised that trade and industrial will not be oppressed, but the sale of alcohols was banned, and the cost of the Austrian crown was set at 30 Russian kopecks (DAIFO, ф. 636.1.4, p.8).

Later, on October 23, 1914, the Russian army guaranteed the preservation of mone-tary savings in banks for citizens loyal to the occupation authorities (DAIFO, ф. 636.1.4, p.17). On December 15, 1914, residents of the city were forbidden to buy goods at the rankers of the Russian army by the decisions of the governor-general (DAIFO, ф. 636.1.4, pp.5-6).

However, occupation conditions did not contribute to economic prosperity and to the food security of the city. This is a natural result of military operation. So, at the end of 1914 the Russian authorities issued an official communication about the need to take into account the products and fuel within three days that were available from the sellers and the population. What was hidden, requisitioned free of charge and transferred to the city government for distribution to the poor inhabitants of the city (DAIFO, ф. 636.1.4, p.28).

In the tasks and military strategies of the Russian Empire, Stanislavov played a large role. The first important point was that the city was in the so-called "buffer zone", and

therefore served as an outpost for the protection of the empire as a conditional, cordon city. On the other hand, Galician in the eyes of then political leaders was a theatre of a possible military conflict with Austria-Hungary. Regardless of the imperial regime, Stanislavov was considered as the future territory of the Russian Empire.

The obligatory resolution of the Galician governor-general on January 26, 1915 forbade the export of money, securities, silver, gold and platinum beyond the borders of Galicia and Bukovina (except Russia) for an amount of more than 500 rubles per person. It also, prohibited the payments, deliveries or transfers of any sums of money by Austrian, Hungarian, or German and Turkish nationals. At the request of the payer, payments could be contribution to a special fund formed in the Lviv field treasury (DAIFO, ф. 636.1.5, p.1).

From 7 to 20 February 1915 the city was under the control of the Austrian troops. The Burgomaster K. Fiedler immediately spread the proclamation about the need to follow the rule of law and the punishment for illegal actions. The city authorities prohibited the sale of alcoholic drinks, exceeding the maximum prices for goods, encroachments on property, resistance to law enforcement officers (DAIFO, ф. 636.1.5, pp. 6, 11).

As a result of escapes and migration of the population due to ongoing military operations in the city and its surroundings, in the city remained many empty apartments. According to reports of the Russian authorities, on the Lithuanian street had 52 vacant apartments, on the street. May 3 – 56 apartments, st. Sapizhinsky – 79 apartments, st. Goluchovskygo – 45 apartments, st. Petra Skarga – 30 apartments, etc. (DAIFO, ф. 528.1.21, pp.31-37).

However, there were cases where the homeowners returned. One such example is the Jew A. Brill, who had a building and trade shop on the Koliyova street. The Russian police, in the context of the struggle against Austrian intelligence service, could not understand why the businessman at the beginning of the war was wicked and mocked up the Russian prisoners, fled with his family during the retreat of the Austrians, but later returned and opened a store (DAIFO, ф. 528.1.58, p.59).

According to the report of the Stanislavov' police chief: "... in the city trade and crafts were very developed and were exclusively in Jewish hands...". Russian troops recorded the presence of such enterprises in the city: stearin candle and match factories, a yeast plant and a rectification plant, a wool factory, a vodka factory, a brewery, a basket factory, four leather, three brick and tile factories, a steam mill and two oil refineries (DAIFO, ф. 528.1.1, p.177).

The Russian occupation called the city's butchery, electric and gas plants, "sling-shots", city taxes and a cemetery as sources of incomes of city authorities (DAIFO, ф. 528.1.1, p.177).

As of 1913, there were 909 trade enterprises in the city, in particular Jewish ones – 843 (92, 7%), Polish – 50 (5.5%) and Ukrainian – 16 (1.7%) (Monolatiy, 2017, p. 76). It should be noted that private individuals actively applied for permits to open shopping agencies in the city. There were cases of opening a business in the city by foreigners. So, a Greek subject to Anastasius Kistinius in the Market Square opened a grocery store (DAIFO, ф. 528.1.58, p.91).

The occupation authorities tried to regulate and limit the consumption of food products in the conditions of war, one of which was the order of the governor of Galicia dated May 15, 1915 on restricting meat consumption – on Tuesday and Friday it was forbidden to sell meat or dishes from it (DAIFO, ф. 636.1.5, p.4).

The Russian army brought with it a significant number of uneducated and corrupt officials, who carried out numerous abuses. In April 1915, the police chief of Stanislavov noted that the "okolotochny" (an urban police officer-author) Karpenko, being drunk, burst in to the inhabitant of Knyagin-girki the Jew Leon Zilber and demanded a thousand rubles from him. Later it became clear that the Zilber helped the policeman in receiving bribes from other persons in the amount of 50 kopecks to 5 rubles (DAIFO, ф. 528.1.14, p.175).

In the circular of the Ternopil governor of March 3, 1915 it was reported that Russian officials often borrowed various goods and products and did not pay for them (DAIFO, ф. 528.1.58, p.80). Russian soldiers did not always behave in an exemplary manner.

Despite the war, the Russian police recorded the presence of prostitutes in restaurants, cafes and cinemas, and in Prokaty, Pasechnaya and Mikintitsy, "prostitution freely hidden" (DAIFO, ф. 528.1.16, pp.44-45. According to the Austrian police in 1907 in the city there were 198 registered prostitutes and 710 hidden, of which only 15 passed the medical examination in the spring of 1915). It should be noted that according to the order of the chief of the Russian garrison on April 14, 1915, restaurants for officers were open until 12:00 am, cinemas were up to 11:00 pm, and private persons were allowed walk through the streets, visiting restaurants, etc. only up to 10:00 pm (DAIFO, ф. 528.1.58, p.80).

Since June 8, 1915 Stanislavov came under Austrian occupation. After the return of the Austrian authorities, the urgent issue was rebuilding the destroyed infrastructure again. On July 14, 1915, representatives of M. Stanislavov participated in the organization "Union of 30 cities of Galicia", which operated in Krakow. The organization decided on a large-scale action for the economic and technical reconstruction of cities. The ways for reconstruction would be mostly subventions and other resources. To receive assistance, it was necessary to assess the military damage to the economy and individuals. In order to analyze the losses suffered, magistrates had to open special bureaus, which consisted of architects, officials and members of the public. Work on damage assessment should be completed by August 10, 1915 (DAIFO, ф. 7.1.268, p.1).

In addition, on August 12, 1915, in the city was made an announcement about the possibility of declaring to the Magistrate about the damage caused by the war, and from August 19 it was possible to inform the Magistrate about the material losses from the flattening during the war of the military or the maintenance of horses in the buildings of citizens (DAIFO, ф. 636.1.5, pp. 31, 34).

In the conditions of military poverty, the Austrian authorities tried to avoid speculation in the food market and rigidly regulated social and economic life. June 12, 1915 was determined by the official course of the German mark – 1 crown 30 halercz. September 20, 1915 it was reported that payments on bank liabilities were not canceled, but only was delayed payment of certain obligations (DAIFO, ф. 636.1.5, pp. 15, 39).

The announcements of the city's Magistrate of June 8, 1915 allowed the merchants of flour and grain to keep their reserves untouched, and trade with private persons only after special permission of the city authorities (DAIFO, ф. 636.1.5, p.15.). On June 14, 1915, the Magistrate banned the sale of alcoholic beverages, the export of consumptive goods and cattle from the city without special permits, announced the acceptance of weapons and ammunition, as well as property that got to people by robbing the real owners. Public closed institutions could work from 9 pm to 6:00 am, restaurants to 11:00 pm (cafe "Union" and "Habsburg" to 12:00 am), and movement around the city was prohibited from 11 pm to 3.30 am (DAIFO, ф. 636.1.5, pp. 19, 20).

Warfare and the ultimate occupation always have a direct impact on the economic situation of the local population. The occupation authorities almost always pursue a policy of plunder against state and private property. In addition, residents often have to supply a number of different products to the professional army. This applies in particular to persons running a business and farmers. Reducing the amount of food products on the market, in turn, translates into higher prices and rationing of goods.

June 15, 1915 in the city was issued a warning to the Magistrate on the punishment of the population for concealing consumer goods, inflating prices for goods, speculation, give light weight (DAIFO, ф. 636.1.5, p.8). According to decisions of the magistrate on June 19, 1915 the work of food stores was mandatory. Besides, residents pledged to report on the availability of their livestock. Since September 23, 1915, began a mandatory census of foodstuffs among the population (DAIFO, ф. 636.1.5, pp. 21-22, 40).

According to the order of August 18, 1915, it was possible to bake only rounded buns in water weighing 35 grams and sell them at a price of 4 halerz per piece. Flour for biscuits to be only wheaten, and for baking bread – both wheaten and rye. Bread should be baked in loaves weighing not less than 280 grams, and its price should be 5 halers for 70 grams (DAIFO, ф. 636.1.5, p.5).

January 25, 1916 was introduced a number of rules and limitations for bakeries and confectionery. In particular, it was forbidden to bake bread from wheat flour, cookies from yeast pastry, confectionery products could not be baked from wheat and rye flour, and could only be sold two days a week, it was forbidden to put biscuits on tables in bakeries and confectioneries, bread sellers could sell it by pieces at the buyer's request (DAIFO, ф. 636.1.6, p.12).

February 5, 1916 Magistrate banned the manufacture and sale of cookies. Bread could only be baked in long and round loaves, which, with full cooling, should weigh 280 grams and the bread should also be refrigerated. The loaf should be easily divided into four pieces of 70 grams each. In addition, 20% of the potato mixture had to be forcibly added to the bread. The price of bread could not be more than 3-5 halerz for 70 grams and 7 halerz for every 140 grams (DAIFO, ф. 636.1.6, p.17).

As a result, the social and economic crisis forced the government to announce on November 3, 1915, the introduction of cards for bread and flour in the city, and from November 7 persons who were in Stanislavov for more than 24 hours were to receive special permits (DAIFO, ф. 636.1.5, pp.47-48).

By order of the imperial royal governor of the province of G. Kollard on January 11, 1916, the city set the maximum price for flour. Thus, wheat flour and rye flour should cost no more than 50 halercz per kilogram. In case of failure to fulfill these price requirements, the authorities and police warned about requisitions and punishment of fines up to 2000 crowns or arrest up to three months. The Magistrate banned the sale of bread and confectionery products in the absence of bread cards (DAIFO, ϕ . 636.1.6, pp. 1, 14).

In the end, on February 4, 1916, a restriction was imposed on the consumption of bread per person (for working people – 300 grams per person, for working families – 200 grams per person). The residents of the city were warned: "...if someone uses carelessly his stocks or otherwise gets rid of them, he will feel hunger because there will be no bread for him." On March 13, 1916, in order to prevent a deficit, it was announced that it was possible to buy bread and flour only in the gmina where the bread card was issued. Since March 16, inhabitants of the city had to decide on a trade institution (with 25 offered), where they would to receive their bread cards (DAIFO, ϕ . 636.1.6, pp. 15, 28, 31).

To deal with speculation and concealment of sugar stocks, the Magistrate on January 14, 1916, determined 17 sugar sellers who had the right to sell it at a fixed price – 1 crown and 6 halercz per kilogram. But on January 27, 1916, were announced the maximum prices for oil (1 liter of oil – 44 halercz). On February 5, 1916, the government demanded from all producers and sellers of sugar to report its stocks and warned that concealing sugar supplies would be punished with arrest from 1 month to 1 year (DAIFO, ϕ . 636.1.6, pp. 9, 13, 16.).

The order of the Austrian governor on March 6, 1916 prohibited the sale of milk and dairy products in establishments of catering from 02:00 to 07:00 pm. An exception was the dining room, where ate poor citizens. There, dairy products were sold from 02:00 to 03:00 pm and from 06:00 to 07:00 pm (DAIFO, ϕ . 636.1.6, p.2).

The socio-economic situation did not improve due to the ongoing war and prolonged occupation, during which the occupying authorities were still demanding the supply of further contingents, and imposed quantitative restrictions on the population in the purchase of basic necessities. So on March 20, 1916, sugar cards were introduced for those families who had sugar reserves of no more than 2.5 kg per person. Confectioneries, coffee houses, restaurants had to submit information about their needs for sugar to the authorities, and also to report on the available reserves of coffee. At the same time, agricultural producers, traders and entrepreneurs should report to the city on the state of potato stocks in the city (DAIFO, ϕ . 636.1.6, pp.34-36).

The Magistrate also initiated a number of actions in the city that should help Austria in the war. August 14, 1915, it was announced the beginning of the purchase in the population for military needs, "all sorts of metals." September 30, 1915 The city's magistrate appealed to the population with a request to help military with food, for-age and firewood, after that citizens should receive the compensation for expenses, and on October 1 was held in Stanislaw a "patriotic gathering" of metal for the needs of the army (DAIFO, ϕ . 636.1.5, pp. 32, 42-43).

October 5, 1915 in the city was circulated appeal of the imperial royal governor of the province G. Kollard on the need for participation of the population in a military loan

(DAIFO, ф. 636.1.5, p.42). April 21, 1916 "patriotic loan" for military needs was repeated. Possible patriotic appeals to the city's public did not have a significant effect, because on October 20, 1915, was announced the requisition of any metal dishes for the needs of the army, on 11 November, the collection of metals began, only industrial enterprises that had military orders received privileges (the declaration of January 25, 1916 established proportions for requisitions – 1/3 of metal items from manufacturers and industrialists and 1/2 from owners of restaurants, taverns, bakeries). November 12, 1915 there were announcements of collecting "for reward" items of gold and silver. December 5, 1915 and May 10, 1916 in the city again announced the purchase of metal dishes from the public, and December 9, 1915 began to purchase food (DAIFO, ф. 636.1.5, p. 46, 49-50, 52, 54; DAIFO, ф. 636.1.6, pp. 11, 44).

Despite all the poverties of the war, the city continued to develop. By the decision of the Magistrate of May 5, 1916, permission was given to start work on laying sewer networks between the streets of Sapizhinska and Sobieski (DAIFO, ф. 7.1.269, pp.1-2). At the same time, the Magistrate on January 14, 1916, announced that the owners of agricultural land would agree to help with the spring field work. In addition, despite the war, the Austrian authorities made a transition to daylight saving time on the night of April 30 to May 1, 1916, in order to save costs for lighting (DAIFO, ф. 636.1.6, pp. 7, 43).

In the summer 1916 the "Brusilov Offensive" began, when Russian troops under the command of General A. Brusilov on a broad front line broke through the defense of the Austrians and rapidly began to move deeper into the territory of the enemy. On August 11, Stanislavov was captured by the Russian army (Первая мировая война. Брусиловский прорыв, 2018). Stanislavov found himself in the front-line zone and underwent considerable destruction. As a result, the town hall was damaged, many houses around were destroyed. The Armenian church and the building of the former Jesuit collegium received significant damage (Bondarev, 2007, p.25).

Immediately after the arrival of Russian troops, the chief of the garrison, Major-General Osipov and the commandant of the city, Lieutenant-Colonel Dolinsky announced the introduction of a curfew. Exit to the streets of the city was allowed from 6.00 am to 9.00 pm hours, restaurants should be closed at 6.00 pm, cafe at 8.00 pm (except for the restaurant and cafe at the hotel "Austria", which could be opened until 11.00 pm).

The notification of the Russian authorities on August 13, 1916 informed the population that it was forbidden to export copper, zinc and other metals from the city; skin; as well as food products. Note that on August 27-28, 1916 was made requisition of motorcycles and bicycles for army needs. In the city, had to be stopped the sale of alcoholic beverages, as well as the production and sale of publications, ridiculing the Russian Empire (booksellers should have been withdrawn from the sale of similar literature, otherwise the owners were threatened with exile to Siberia). In addition, residents of the city were forbidden to buy things into soldiers (DAIFO, ф. 636.1.6, pp. 47, 50).

The occupation regime began issuing new bread and sugar cards, and food trade was allowed. Stores that did not open were subject to requisition. Jews were given bread and sugar cards separately from Christians, which was a manifestation of national discrimination (DAIFO, ф. 636.1.6, pp. 49, 55, 57).

The following course was set for monetary circulation: the Austrian crown was 39 Russian kopecks, the German crown – 46 Russian kopecks (for a gold coin), the Austrian crown – 25 kopecks, the German crown – 30 Russian kopecks (for a silver coin), the Austrian crown – 15 Russian kopecks, 17 Russian kopecks (for banknotes) (DAIFO, ф. 636.1.6, p.47).

According to the data of the Magistrate of Stanislavov on September 3, 1916, there were about 28,000 inhabitants in the city (according to the registration cards of November 27, 1916, the police gave more accurate figures – 4,067 men, 10,521 women, 11,429 children), both permanent and evacuated from other gmins. Probably there were about 6,600 inhabitants in the Knyaginín town, about 3,000 in the Knyaginín colony (these gmins were separate administrative units and had separate administrations) (DAIFO, ф. 528.1.36, pp. 2, 109).

For a weekly needs of the city, were necessary 1500 poods of wheat flour, 1500 poods of bread, 1500 poods of cereals, 400 poods of sugar, 20 poods of tea, 20 poods of yeast, 1500 poods of various fats, 400 poods of salt and 20 pigs (DAIFO, ф. 528.1.43, p.30). So, in January 1917 the city planned to spend 6,500 poods of wheat flour, 6,600 poods of rye flour, 6,600 poods of various cereals, 2,000 poods of sugar, 100 poods of tea, 100 poods of yeast, 6,000 poods of various fats, 2,000 poods of salt, 100 poods of wax candles, 2000 puds of kerosene (DAIFO, ф. 528.1.43, pp.73-74).

The statistical reports of the police department of the city contained data on factories, warehouses and workshops in the area of Stanislavov. Namely: 5 tanneries, 2 brick factories, a carpentry workshop, a cart factory, a liquor factory, a brewery, a yeast factory, a cast iron foundry, a weaving factory, an alcohol-cleaning plant, an alcohol factory, two mechanic workshops, a sawmill and forest warehouses (DAIFO, ф. 528.1.36, pp.59-60). Some of these enterprises at that time did not work, and most of their owners moved deeper into Austrian territory. Urban enterprises could also be stopped through requisitions, as it happened with the city butchery on the Golu-khovska street, which did not work through the requisition of machine belts from July 25, 1916 (DAIFO, ф. 528.1.46, p.8).

There were also data about a mill, a sausage factory, a city gas plant, a parquet factory, seven shoe shops, and seven pharmacies. The number of trade establishments was 171, in the city there were hotels – Habsburg (20 rooms), Union (34 rooms), Hübner (20 rooms), Austria (18 rooms), Central (18 rooms), European (16 rooms), Black Eagle (12 rooms) (DAIFO, ф. 528.1.36, pp. 64-67, 73-74, 81, 113-117). Despite the war, ten carriers operated in the city. The fiacre travel price ranged from 1 crown 20 halves to 4 crown, depending on the comfort and duration of the trip (DAIFO, ф. 528.1.43, pp.142-143). For the ramming and preservation of highways the city had only one tractor (DAIFO, ф. 528.1.51, p.134).

Even before the war, the city developed in the socio-cultural sphere. There were three printers in Stanislavov, four cinemas, a theater for them. Stanisław Moniuszko and seven shops with books and paper articles. They all existed almost continuously during the occupation, although the activity of printers, cinemas and theater was under the supervision of the Russian authorities.

As of November 20, 1916, in the inhabitants numbered 267 units of large and small cattle, 166 pigs, 102 working horses. However, not more than 1/3 of the harvest was collected, and the rest was destroyed in the course of military operations. The harvested crop was not enough for food provisions, and besides, winter wheat was sown with no more than 40% of the agricultural land (the rest was occupied with fighting positions) (DAIFO, ф. 528.1.36, pp. 51, 86).

In connection with these circumstances, food aid in the city required 10,480 people, of whom 19% (1,906 people) were intellectuals. The situation was partially solved with the assistance of charitable organizations. Thus, under the Magistrate, the Meshchansky Committee and the All-Russian Zemsky Union created two shops and a food point. 12 stores were organized by the Magistrate, 1 shop by the Union of Cities. In these shopping centers you could buy goods at a cost price, and the food point provided up to 200 free lunches. The city also had six shelters for the homeless, the infirm and the elderly (DAIFO, ф. 528.1.36, p.109).

At the same time, according to official government data, as of November 1916, rye bread of grade 1 in Stanislaviv county cost 47 kopecks per 1 kg, wheat bread 75 kopecks per kg. Flour rye (80 kg) of 1 grade could be purchased for 30 rubles, wheat flour – for 36 rubles. For veal and pork meat, the price was about 1 ruble per kg, the oil cost 4 rubles per kg, the egg was sold at a price of 60 kopecks per 1 piece, and 1 liter of milk could be purchased for 35 kopecks. Against the backdrop of the prices of food products, the possible earnings of the residents of the city looked scant. Thus, an unskilled worker for a day of work with food received 1 ruble of salary (a woman for the same job – 75 kopecks, and a teenager – 50 kopecks). Somewhat more was the salary for work in plasterers – 1 ruble 50 kopecks; at carpenters and locksmiths – 2 rubles 40 kopecks, a bricklayer and a smith received 3 rubles for labor (DAIFO, ф. 528.1.33, p. 21).

Police monitored that the sale of essential goods in the city was not carried out at inflated prices. Sellers, violators were subjected to administrative fines in the amount of 10 to 50 Russian rubles (DAIFO, ф. 528.1.38, pp. 39, 49, 77, 109). The fines were also imposed for the passage without the established passes, the illegal purchase of various things (15 rubles a penalty) from lower ranks of the Russian army, the increase in house prices, the sale of alcoholic beverages and their illegal drinking (100 rubles in fine), and the prostitutes who did not undergo medical examination, was arrested for three days (DAIFO, ф. 528.1.38, pp. 55, 132, 162, 165, 193). Only for October – December 1916, the fine collected for violation of mandatory regulations amounted to 2,975 rubles (DAIFO, ф. 528.1.41, p.27).

The Russian authorities also actively carried out requisition for the needs of the army of various products and goods – from washstands and toilets to sewing machines and dynamo machines. At the same time, money for goods was not paid, which in official documents was explained by the fact that the owners were absent during requisition (DAIFO, ф. 528.1.35, p. 110-160).

After the February revolution in Russia, the occupation authorities declared a radical change in attitude towards the population of the seized territories. Thus, in the appeal of the regional commissar of the Provisional Government in Galicia and Bukovina, D. Doroshenko to the population of the occupied territories of May 20, 1917 it was stated that " [...] the new government considers it fair to take all measures to facilitate the fate

of the inhabitants of the occupied territory, namely, to give the population freedom both in restoring old forms of self-government in rural and urban areas, and in restructuring them on new broader grounds, if that population wished [...]" Under the new conditions, the Russian government set itself the task of streamlining the food business and organizing councils in the counties and provincial commissars (DAIFO, ф. 636.1.7, p.1).

The city continued to operate restrictions on the work of trading establishments and institutions for recreation (according to the decree of February 20, 1917, trade was to be carried out from 8.00 am to 08.30 pm, cinemas, cafes, etc. should be closed at 08.30 pm.), and from 9.00 pm the started curfew (DAIFO, ф. 636.1.7, p.6).

July 8, 1917 began the last large-scale offensive of Russian troops. The army struck at the Galich – Stanislav section in the direction of Kalush, Bolekhov, and its offensive was successful (Zayonchkovskyy, 2002). However, demoralized by revolutionary events at home very quickly, Russian troops began to retreat and left Stanislav. At that time in the city massively destroyed factory equipment and occurred harassment the local population (Havryliv, Arsenych & Protsak, 1998, p.74).

In the center of the city many houses were burned and throughout the province the war left deep traces (Tsekler, 2007, p. 68). Then the house of Khana Landa burned down, which divided the modern Viche' Maidan into two parts. The passage of Gartenberg was completely destroyed and the houses were placed around it (Bondarev, 2011, p. 20). Broken by ammunitions, shattered by the bombing of the city, devoid of any conservation, the city hall was cracked and could collapse at any time (Bondarev, 2011, p.14). The greatest destruction took place along Karpinsky Street (now it is a segment of Galitska Street from its beginning to the Town Hall), along Kosciuszko Street (Sotnyk Martynets), the whole area of Franz Josef disappeared from the map of the city, etc. the Austrians even held a narrow-gauge railroad to the center, along which they removed construction debris (Bondarev, 2009, p.20).

In connection with the military actions, the city was in a difficult financial situation. Evidence of this is a loan received from the regional authorities in September 1918 (DAIFO, ф. 27.1.1, p.5). In the amount of 2 million 382, 281 crowns (Chernov, 1971, p.62). During the last two years of the war, prices for essential goods rose by 1,000 percent or more. For any stabilization of the socio-economic situation, the Magistrat attempted to distribute responsibilities among all residents of the city. In particular, it was decided to register all residents of the city with their addresses in order to evenly distribute apartment duties to all residents of the city (DAIFO, ф. 636.1.8, p.8).

The Austrian authorities tried to limit the growth of consumer prices in order to reduce social tension. Thus, by order of the mayor from August 26, 1917, those in need could claim food aid, whose monthly income for one member of the family did not exceed 75 crowns (DAIFO, ф. 636.1.7, p.16). But in pursuance of the order of the vicegerency in Galicia on November 20, 1917, the city determined the maximum prices for wholesale and retail trade in sugar. Thus, by order of the mayor from August 26, 1917, those in need could claim food aid, whose monthly income for one member of the family did not exceed 75 crowns (DAIFO, ф. 7.1.272, p.1).

For the impoverished population, in the city worked military cuisine (DAIFO, ф. 636.1.7, p.25). Furthermore, the government practiced overtime sales of bread. So, since

February 14, 1918 they sold half of the bread for each member of the family, besides that, it was possible to exchange flour cards for bread. But from 3 to 7 October 1918, they sold 1 loaf of bread for each member of the family. The resolution of January 28, 1918 permitted to increase the consumption of flour for those who work hard from 1150 to 1850 grams, also facilitated the life of the poorest (DAIFO, ф. 636.1.8, pp. 1, 5-7).

Simultaneously, the city suffered from the continuation of the war. Announcements of the imperial-royal stage team on August 4, 1917 provided for informing the inhabitants of the city about their food supplies. The commoners should keep with themselves 20 kg of flour, 10 kg of cereals, 10 kg of beans, 1 kg of sugar, salt, tea, a half kilo of soap, and the excess was pledged for military needs. In October 1917, conducted the requisition of horses from the population for the needs of the army (DAIFO, ф. 636.1.7, pp. 3, 15, 20). Authorities even banned the produce of moonshine from pears, plums and apples, except for vegetables that were not able to consume in raw form. Although for produce of moonshine, were needed special permits (DAIFO, ф. 636.1.7, p.19).

The Great War, which ended, did not bring a peaceful period for Stanisławów and its inhabitants. In addition to the Poles waiting for the reconstruction of the Polish statehood, Ukrainians became active in the town, who on October 21, 1918 created the National Council, which on the night of November 1, 1918 took power from the Austrians, proclaiming the establishment of the Western Ukrainian People's Republic. Although the situation in the city was not occupation-like, the residents were waiting for the full liberation and inclusion of the city in Poland until May 1919. However, this is a separate element of the history of the city and the region. (Grajny, 2016, pp. 131-132, 139-140).

Summarizing, it is worth noting that during the war the city was occupied several times, so the authorities and their priorities changed. This had a significant impact on residents, infrastructure and the city itself, including the economic and economic situation. As mentioned in the text, especially the occupation carries quite significant economic consequences. I am talking here specifically about the reduction of the amount of goods on the market and the resulting price increase for individual goods. The above situation is important in relation to sellers and intermediaries on the one hand, and buyers on the other. The former, often trying to seize the opportunity, artificially raise prices in order to get rich faster, which in turn affects the impoverishment of consumers and the rapid deterioration of social moods.

In the presented example, you can see that economic mechanisms are triggered during the war. Not for all people, the period of war and occupation only means financial losses, although it must be admitted that few are getting richer on this occasion, while most people are poor.

Abstract. *The authors draw a parallel between the economic and financial crisis of 2008 up to 2010 and the crisis of Economics as a scientific discipline. Both bankers' greed, with their toxic products, and consumers' greed who, most of them, had borrowed money to buy a second home, were the most important causes of the recent financial crisis. The recent financial crisis has shown us that the Economics itself is in crisis because it is grounded on hypotheses unproven by reality. It refers both to the assumption of spontaneous market regulation and to that of the capitalization of interest. The work demotes these assumptions and proposes as the solution a sustainable development in which the individual returns to the fundamental values: family, environment, community, partnerships, resource saving, communion with others. The main conclusion is that the economy should be understood from the following holistic approaches: economic, social, cultural, philosophical, political and spiritual. With regard to money (as the subjects and the main objects of Economics), the rich is the one who gives, the one who helps his fellows and not the wealthy people of these days who have perverted the economy so that to justify the usury, the speculation and the financial engineering.*

Keywords: *holistic; the sustainable development; the crisis of economics; the economic crisis; greed.*

Introduction

There have been a lot of discussions about the causes of the recent financial crisis. The clearest voices have led to one fundamental cause: greed. It was not only the greed of the bankers who gave easy credit by bulletin and with good interest for them but also the greed of the borrowers who, although most of them had a dwelling, wanted one more, as if you could live in two houses at the same time.

If at origins, in Adam Smith's view, capitalism had moral foundations, then they disappeared altogether. Why is abstinence important, fasting? Why is no greed good? There is even a Romanian proverb, "greed ruins humanity"

Going ahead, we ask our next question: why are there rich and poor? Why do people have no equal income? From a Christian perspective, there is a very simple answer that is incomprehensible to economists, sociologists, philosophers or politicians. The rich achieve redemption through the poor and the poor through the rich. How can this be done? The poor ask the rich for help and the rich give mercy to the poor. In this context,

they both live heaven on earth. But does this actually happen? Do not the rich despise the poor, and the poor envy the rich? Based on these feelings, each one lives like hell, and basically, the two are irreconcilable enemies.

The economic crisis

Some authors consider that in the years before the 2008-2009 market crisis, in the old core of the capitalist world capital system, capital, and debt transactions have overtaken industries that generate jobs and profits for everyone. If financial instruments accounted for only a quarter of the investments in the 1970's, in the 1980's the financials raised the total to 75%. Globally, financial assets accounted for 4 times the value of all investments and 10 times the world's global GDP. The recent financial crisis reveals the main internal vulnerability of capitalism. This is a systemic risk - that is, risks that are part of the complex network of internal connections that constitute the modern financial system. The impact of this financial crisis has been multiplied by the enormous increase in global finances over the past decades and the extent to which financial assets have come to dominate advanced Western economies. (Wallenstein et al., 2015, pp.204-209)

We basically find out how the symbolic economy overinflates the real economy in its own right, and this grows inexorably. Financial crises appear just to correct this imbalance between the real economy and the symbolic economy.

"It is characteristic of the fractional reserve system that virtually all money is created as debt, which means that all money brings interest to the bank. The problem is that banks, with each new loan, create the principal credit, but not the money to pay interest. Their payment must be made by contracting new loans, and interest on these new debts may also be paid through other loans. This leads to the conclusion of an "impossible contract" because there is never enough money to repay the loans without taking out other loans. In other words, loans must be constantly imposed on the economy to pay interest on older loans. Ultimately, there is an overdevelopment of the system, which results in a credit crunch. People most affected by the recession are usually not part of the group who benefited from credit expansion. Therefore, rewards are privatized, and risks, socialized. Winners are looking to keep their profits, while ordinary people are required to cover their losses. (Médaille, 2012, pp.72-75)

Hence the perverse morality of capitalism: in good times, the bankers earn, in the bad ones the losses are borne by the population. Such a background flaw has no long-term and even medium-term coverage.

Kennedy argues that our monetary system is based on the exponential growth of compound interest, a model that is present in mature natural organisms only in diseased cells, mainly in cancer cells. As long as the economy has to follow the pathological growth of compound interest, which keeps the money in circulation, we will have to increase our economic growth even at the cost of destroying the environment. The current monetary system allows us to choose between two types of collapse: social or environmental. The growth of the real economy, dependent on the availability of natural resources, differs from monetary growth to such an extent that the requirements of the financial economy can no longer be met. Thus, while monetary assets in Germany increased 46 times from 1950 to 2010, and bank interest rates 37 times, Gross Domestic Product grew only 8 times. It is as clear as possible that the exponential growth required

by our money can no longer be maintained by the real economy. (Kennedy, 2012, pp.12-13)

The assumption of interest capitalization is not sustainable in the medium and long-term, and excessive funding brings about the emergence of financial crises that are more and more powerful and hit the center of the financial system.

Saint Basil the Great considers that poverty is not a shame. "Why should we add debt repayment? Nobody heals a wound by another wound, nor does he heal evil by evil, nor deny the poverty of interest. Are you rich? Do not borrow! Are you poor? Do not borrow! If you are rich, you do not need to borrow, and if you have nothing, you will not have what to pay for your loan." (St. Basil the Great, 2009, pp.58-59) If mankind had obeyed and had applied the wise counsels of Basil the Great, we would not have had today's financial capitalism and the unprecedented gap in the history of mankind between the rich and the poor.

The crisis of the economics

Globalization is a dynamic, non-stop, dynamic system that has both beneficial and unfavorable results. Therefore, when looking at globalization, we need to look at it in terms of the balance between these results and their impact on long-term growth. Some comparative estimates illustrate how creative, in terms of economic dynamics, can be some interrelations. It appears that under the same conditions common language contributes to a 42% increase in sales turnover. The growth is 47% if the respective countries belong to the same trading block, 114% if they have the same coin and 188% if they have a common colonial past (Kolodko, 2015, p.75). The inter-correlations established between states call on the table the main economic actors: the national states, the United Nations, the World Bank, the International Monetary Fund, the World Trade Organization and the transnational companies.

Economics cannot be a natural science. It is closer to the quaternary structure of reality and being: the human-cosmic-God and the unfathomed equation of existence. Because man lives in history, the new economic science also needs a new theory of history, understood as the development of meaningful structures over time. It can be reduced neither to neoclassical abstractions, nor to institutionalism, but must take into account the anthropological background, the richness of ideas and symbols by which the human community expresses its fundamental existential experiences (Brăilean, 2011, pp.83-86).

Essential is the human-society equation-Cosmos-God. Basically, the answer to all the problems of mankind is this: the return to the sacrament and the consciousness that we are stardust. The old man-society paradigm has brought us to the crises of our day: that is, a sum of economic, spiritual, ecological, social, political, environmental crises.

"The economy counts itself as the ablest to interpret the social world of our time, but we always find that it needs a myth for this role. The economy uses the myth in several respects or in several ways. First, it serves the myth in its starting hypothesis, and then it creates itself myths and stories. Homo economicus' model is precisely such a model-myth. The fact that it tells us a story by covering it with a mathematical coat that does not change its mysticism. As an example, take the myths and stories about total

rationality and assumptions about perfect information or the invisible side of the market, but also the story of man's freedom and self-determination, or the myth of eternal progress or self-regulating markets. No one has ever seen any of these things, but they are stories, beliefs or myths that resonate strongly in economic theory. And our disputes, experiments, and statistics that we are doing are leading to the confirmation or overthrow of these narratives." (Sedlacek, 2012, pp.194-195)

That is why we advocate for *Homo spiritualus*, which transcends consumerism and emphasizes on balance, temperament, love of nature and knowledge of spiritual laws.

We believe that we can solve all current problems through "masculine" means: by changing institutions and adopting new laws through planning and computing. However, in the end, they alone will not resolve them and will never succeed. What will always succeed, even though apparently defeated, is something as different as possible: a vision, an experience behind all these structures, which, alone, can give them meaning: the overwhelming humility of the personified Church in the Mother of God... behind all the struggles and conflicts that have sprouted the world is the secret desire, unknown and unconscious after the final synthesis, after a convincing image of man and humanity. It is what the Church, and it alone, can offer to the world." (Schemann, 2014, pp.81-83). The Mother of God is glorified and glorified by both the Universe we know and the one we do not have access to because of our limited knowledge of life, spiritual laws, the Cosmos.

Poor and wealthy people are not in the world, neither by chance, nor because the making of this world would be an irrational one, but according to the overwhelming Divine Care. God can level everyone in an instant as wealth, but that would be a real madness. In that case, people would become totally independent of one another. Who would then be saved? And how could you save yourself? Because people are saving themselves depending on each other. The rich depend on the poor, the poor - the rich; the cultured one depends on the one who does not know the book, the one who does not know the book of the cultured one; the healthy one depends on the sick one, the sick one on the healthy one. The material is paid spiritually. The spiritual gift of the cultivated one is materially paid by the one who does not know the book ... (Tănăsescu-Vlas, 2010, pp.54-55)

No economic or utilitarian system explain so simply and holistic at the same time the partnership between the rich and the poor.

The sustainable development

James Canton (2010, p.102) predicts 10 key trends in labor:

1. Global struggle to attract talent,
2. The future of labor will not be defined by geography, but by talent,
3. Population aging in America and Europe will have dramatic effects on society and the economy,
4. Hispanic population and women will dominate the future of the United States labor force,
5. A high percentage of new employees and leaders will be women, permanently changing the strategies of the boards of directors and the market,

6. A high level of immigrants will be needed to allow talent to keep pace with business and society requirements,
7. Finding skilled workers in high technology from the global talent pool will be the greatest challenge for each organization and every nation,
8. Innovations will be a key driver for the development of workforce skills, claiming a complete restructuring of the education sector,
9. The domestic labor force will record a slower growth rate due to the alarming decrease in fertility rates,
10. Labor-related crises in the future are likely to be due to the lack of a skilled workforce.

Futurist James Canton puts emphasis on innovation as the main resource of today's day to build tomorrow and to increase the role of women in the labor market at all hierarchical levels of a firm.

Erwin Laszlo (2008) believes that 2012 marks the gateway to a new world, a new civilization, based on a new way of thinking and a more evolved consciousness because the current distribution of wealth, the global financial system, and the current social system no longer support. He identifies 10 stories of changed consciousness:

1. We live in ways that allow others to live,
2. We live in ways that respect the right to life and the economic and cultural development of all people,
3. We live in ways that protect the intrinsic right to life and an environment that supports life,
4. We seek happiness, freedom and personal fulfillment in harmony with the integrity of nature and our fellows,
5. We ask that our government connects to other nations and people in a peaceful and cooperative spirit,
6. We ask business organizations to accept responsibility for everyone who has an interest in them as well as for the sustainability of their environment,
7. We ask the media to ensure a steady flow of reliable information to make the right decisions,
8. We place them in our lives the less privileged than we,
9. Encourage people to make ethical decisions about their future and their children,
10. We work with such people to preserve and restore the essential environmental balance. (Laszlo, 2008, pp. 139-140)

The New Consciousness takes into account the other, our neighbor and does not focus on pursuing our own interest at any cost. Mankind gradually awakens from the sleep of reason, selfishness, and greed, and discovers spirituality, co-operation, and altruism. These values constitute the cornerstone of Sustainable Development.

D.C. Korten (2009) in "From Ghost Rich to Real Rich" makes a real action plan for a new economy:

1. Re-directing economic policy's attention from rising ghost wealth to increasing real wealth;
2. Recovering undue profits made by the Wall Street and setting fees and commissions at a level that would make the theft and gambling of this institution unprofitable;
3. Implementing price set at the full cost of the market;
4. Correcting the corporate charter;

5. Restoring the sovereignty of the national economy;
6. Rebuilding communities to ensure local independence in meeting basic needs;
7. Implementing policies that create a current trend for business at the human level, owned by local associates;
8. Facilitation and redemption of corporate assets for the democratization of ownership;
9. Using tax and income policies in favor of a fair redistribution of wealth and income;
10. Revision of intellectual property regulations to facilitate free access to information and technology;
11. Restructuring financial services to serve the Main Branch;
12. Transferring responsibility for issuing the currency to the federal government. (Korten, 2009, pp.128-129).

Korten writes a true Constitution of Sustainable Development, in which the primary focus is on the real economy rather than on the symbolic, the individual and not the state.

Chang identifies the following principles for the reconstruction of the world economy:

1. Capitalism is the worst economic system if we exclude all others.
2. We need to exalt our new economic system on the assumption that human rationality is very limited.
3. We need to build a system that pulls out what's best, and not worse in people. Organizations should be built to reward trust, solidarity, honesty, and cooperation. If we leave everything to our personal interest in the short term, we will destroy our entire system, which does not appear to anyone's interests in the long run.
4. We must give up believing that individuals are always paid the 'worth' it is. Individuals in poor countries are often more productive and entrepreneurs than those in rich countries, and the control of migration from rich countries keeps them at the limit of misery. On the other hand, the rules of the scholarships need to be changed, in order to limit the excessive payments of the managers of the limited liability companies.
5. We have to take seriously the idea of producing concrete things.
6. We need to achieve a better balance between finance and "real" economic activities.
7. Governments need to become stronger and more active. (Chang, 2011, pp. 254-261)

Chang (2011) focuses on long-term, honest, cooperative, salient, real economy.

Aivanhov (1991) talks about the economy of the future by pointing to the wound and against the current debauchery consumerism. "Do you want to know the true economy, do you want to have treasures, treasures that you can spend to help others? Well, we need to be careful, bright and to master ourselves. Here's the real economy. It is stupefying to see the number of products now appearing to restore everything that has been destroyed, broken or dirty, not just objects but simple people. It's incredible, half of mankind is working to repair the losses caused by the other half! ... In reality, nature only knows and practices the economy: it knows how to do it in order not to lose a single atom. A little trace of dust, dirt, everything is used ... The leaders of the countries, those who pronounce on economic issues, should first learn some truths that cannot be found in the books of economics: how man is built, as he is bound to the whole universe, which are the hierarchies in the universe, as all human deeds have to obey a model, a celestial idea. At that moment, everything they will do, everything they will order, will be perfect." (Aivanhov, 1991, pp. 110-113). Here Aivanhov shows that nature is wiser than

politicians today and yesterday. Today's politicians need to know the laws of the spirit, and what they will do will be perfect.

It is important to stop the dynamics of exponential growth with its compound interest and increase our overall well-being. To ensure that the new, sustainable money goes in the right direction, it is vital, in the next phase, to make prices that say "the ecological truth" of our lifestyle decisions, reflecting the real costs that the activities we impose on the environment and future generations. All progressive economists support this vision.

Kennedy (2012) believes that sustainable money has the following advantages:

- a. Replace paper profits with real benefit. Thus, the real benefits do not exclude profit but subordinate it to social values.
- b. Their purpose is limited, not universal, because a complementary currency cannot be traded on the world market.
- c. They are tax-supported and do not produce interest. In the new system, exponential growth does not characterize either monetary assets or debt.
- d. It's easy to understand.
- e. They can be democratically controlled and will no longer be used as a power tool.
- f. Supports the community. Conventional money undermines the community because it operates mostly outside of people-to-people communication.
- g. Stop inflation as 100% of goods and services are covered.
- h. They have performance coverage, not ownership. Time invested and productivity are the basis of earnings within this system.
- i. It works for the benefit of all. Sustainable money brings benefits to 90% of the company that will double their income as interest hidden in prices will be eliminated. They also benefit the rest of 10%, people who prefer a stable monetary system. " (Kennedy, 2012, pp.73-80)

Because money today is no longer covered in goods and services, sustainable money is the solution especially in relation to individual-community binomial.

Today, Latin Americans have taken their countries back through the blatant policies: nationalization of certain sectors of the economy, agrarian reform, major investments in education, literacy and public health. (Klein, 2008, p.82) The most significant shield that Latin America puts in the way of future shocks derives from the increasingly prominent independence of the South American continent from Washington's financial institutions. The Bolivian alternative to the Americas is a barter system, where countries agree on the value of goods and services offered, giving relative economic stability and predictability. Here, Bolivia provides gas, at an estimated and stable price; Venezuela provides oil and expertise in the exploitation of natural resources; Cuba sends thousands of doctors." (Klein, 2008, pp.484-485) These countries come out of the US influence area, rediscover the individual and social economy, rediscover owners, producers, and consumers, and discover the benefits of genuine and honest cooperation with countries in their region.

Conclusions

The recent financial crisis requires rethinking the economics as a materialistic discipline and addressing the economic realities of a holistic overview: spiritual-political-social-cultural-economic. The political economy itself is in crisis, and this is due to its very foundation. The symbolic economy overinflates the real economy, just as the political economy negatively affects the religion.

It is the time for a modern man to no longer worship the golden bull-money and his daughters: greed and chaos. We turn to ourselves, to the divine self, to the search for the meaning of life. Life is here and now and is waiting to discover it, giving up the illusions and discovering what is eternal in us. Economic systems so far favor either the state (Marxism, Keynesianism) or TNCs or the financial system (liberalism). The time has come for an economic system to place the individual as a citizen of the city, viewed both as a consumer and as a producer and creator. That is why we use the term sustainable development. Education today and tomorrow must ensure a balance: to be both a mass financial education and a mass spiritual education.

In connection with money, the rich is the one who gives, the one who helps his people, and not the rich nowadays, who have perverted the economy to justify speculation and financial plots.

Abstract. Compared to men, women are at a disadvantage in terms of financial literacy, as shown by many studies. Women have been found less likely to respond correctly to financial test questions and more likely to select 'Don't know' option as compared to men in many national surveys, although causes of the phenomenon are still not fully explained. The main goal of this article is to check whether the gender differential exists among university students based on a new dataset derived from five European countries (self-administered survey, 1,022 respondents). To pursue this goal, we asked a series of questions: (i) Does the way in which financial literacy scores are determined matter for the gender gap measurement outcomes? (ii) Can the gap be explained by the presumably higher inclination of males to guess or greater tendency of males – as compared to females – to overestimate their capabilities? (iii) If the gender gap in financial literacy of university students exists, what factors can explain the gap? We used three-question single choice test to measure debt literacy – a little-studied aspect of financial literacy – and processed its results to obtain different markers of the literacy, allowing us to control for guessing and overconfidence effects. To gauge the possible gender gap in the literacy, we checked the statistical significance of differences in the test responses between female and male survey participants. We also ran a series of logistic regressions to rule out the possibility that gender differences found in the debt literacy test scores due to non-parametric tests were driven by factors other than gender. We confirm the gender differential in debt literacy among university students comprising our sample. We find that the observed gender gap cannot be explained by the combined effects of test guessing and overconfidence. Female business (including finance) students scored significantly better in a debt literacy test compared to their non-business female peers – an effect not present among male students. This could suggest that – unlike women who tend to increase their debt literacy through professional education – men may acquire the literacy differently and outside the formal education system.

Keywords: financial literacy; debt literacy; gender gap; university students; financial education.

Literature review

GG in FL has been repeatedly confirmed among adult population in many countries (Alessie, van Rooij & Lusardi, 2011; Disney & Gathergood, 2011; Klapper & Panos, 2011; Lusardi & Mitchell, 2011; Sekita, 2011; Beckmann, 2013; Brown & Graf, 2013; Instytut Wolności & Raiffeisen Polbank, 2014; Gentile, Linciano & Soccorso, 2016; Stolper & Walter, 2017). Given that FL is usually measured through a test – be it ‘True / False / Don’t know’ test or a choice test allowing for selection of ‘Don’t know’ option – the research community has acknowledged that GG in FL should be measured as the difference between women and men in the share of: (i) correct test responses, and (ii) ‘Don’t know’ responses (Klapper, Lusardi & van Oudheusden, 2015; Mitchell & Lusardi, 2015; Bucher-Koenen et al., 2017; Stolper & Walter, 2017).

The empirical evidence gathered so far suggests that GG in FL is a pervasive phenomenon: it was found that women are less likely to choose correct test options and more likely to choose ‘Don’t know’ options across all socioeconomic and demographic characteristics and without regard to the measurement instrument. Mitchell & Lusardi (2015) showed that GG in FL exists both in developed and developing countries which suggests that income and wealth may be irrelevant for the phenomenon. Lusardi, Mitchell and Curto (2010) found that the gap is present among the young and the old clusters of the entire population. Mahdavi and Horton (2014) evidenced that the gap persists irrespective of the educational attainment and is clearly visible even among the best-educated individuals. Moreover, Bucher-Koenen et al. (2017) point out that the existence of the gap is not a question of how financial literacy is measured, because it manifests itself in studies adopting short tests as well as in studies adopting considerably more complex measures of financial literacy. Moreover, in the light of research findings gathered so far, it seems that women are less financially literate than men across the majority of possible financial themes (Butters, Asarta & McCoy, 2012; Lusardi & Tufano, 2009; Tennysson, 2010).

The set of hypotheses attempting to explain the puzzle of GG in FL is surprisingly small. Hsu (2015) hypothesized that the gap is a matter of the division of labor in same-sex couples (households) with men specializing in household finance management. Although Hsu (2015) does not mention this, the claim can be linked to the theoretical framework of Jappelli and Padula (2013) in which the level of an individual’s financial literacy depends on her / his incentives to acquire the literacy. Male household members may have stronger motivation to equip themselves with financial literacy because of the sense of responsibility for the financial well-being of their family members. Hsu (2015) suggests that the specialization of men in the realm of finance may be linked to traditional social roles of men, however perhaps men are at the same time – for still undiscovered reasons – more predisposed to manage finances. Unfortunately, the empirical research did not bring results unambiguously confirming this hypothesis (Brown & Graf, 2013; Bucher-Koenen et al., 2017; Fonseca et al., 2012).

Brown and Graf (2013) posited that GG in FL might be explained by women being less interested in financial issues compared to men. However, despite it has been found that finance is more interesting to men than to women (Chen & Volpe, 2002; Ford & Kent, 2010), no support has been gained for the hypothesis that observed gender differences in this interest may explain GG in FL (Brown & Graf, 2013). Ford and Kent (2010) proved also that women show less interest in finance than men because of affective reasons, i.e.

they are more likely to attach negative emotions to financial matters (e.g. women may tend to have the feeling of threat in relation to financial markets more often and/or more intense in comparison with men).

Perhaps the affective differences in women's and men's attitudes toward financial markets – corroborated by Ford and Kent (2010) – may be related to the language which is predominant in the field of finance. Boggio et al. (2015) noticed that the language of finance refers to such spheres as competition, war, sport, rivalry, games, i.e. to spheres which are mostly masculinized. Such language may be viewed by women as alien. As a result, women may have a difficulty with identifying themselves with the sphere of finance.

Data and method

Data were collected through a self-administered survey at 26 universities in five countries: Bulgaria, Poland, Portugal, Ukraine, and Wales, between 11 May 2017 and 18 July 2017. Students were sent an e-mail inviting them to fill in the attached questionnaire. The questionnaire featured a cover letter introducing the survey to students as well as assuring them of the anonymity of their responses. Our data set consists of 1,022 student responses to a range of survey queries (DL test and respondent traits). We used the instrument designed by Lusardi and Tufano (2009) to gauge the DL of participants. The instrument is a 3-question single choice test resulting from the adaptation of a classic FL instrument (known as the 'Big Three' – see Mitchell & Lusardi, 2015) to debt specificity. Lusardi and Tufano's (2009) instrument allows measurement of knowledge and skills regarding (i) interest compounding (first question), (ii) how credit cards work (second question), and (iii) the time value of money concept (third question).

Although the 'Big Three' was validated throughout many waves of national panel surveys (Mitchell & Lusardi, 2015), it is questioned for its properties, such as brevity and closed questions, which can entail guessing and other distorting effects (Hastings, Madrian & Skimmyhorn, 2013). In a standard approach to processing the results of FL tests, a correct answer is coded as 1, while all remaining options (incorrect answers, 'Don't know' responses and 'Prefer not to answer' responses) are coded as 0 (such a measure is labelled as Score 1 in our study – see Table 1). However, an indication of an incorrect answer conveys significantly different information compared to the information transmitted by a 'Don't know' or 'Prefer not to answer' response (DK and PNTA, henceforth). The selection of an incorrect answer in a DL test can mean that the respondent either guessed the answer or selected it because of overconfidence, which is treated as a serious behavioral bias (Kahneman, 2011). To get an insight into this effect, we used another operationalization of DL based on a respondent's result of the 'Big Three' DL test, labeled as Score 2 (see Table 1). We considered Score 2 as a proxy for the combined effects of guessing and overconfidence. Additionally, as mentioned in the Literature review section, financial literacy researchers tend to define GG in FL by indicating two patterns: (i) females are less likely to provide correct answers to FL questions, and (ii) females confess that they do not know the answer more often than males. Hence, we deemed the inclination to select DK or PNTA responses worth closer attention and, as a result, we applied Score 3 as a proxy for the propensity to confess one's ignorance regarding debt issues (see Table 1 for details).

Table 1. Applied approaches to processing DL test results (Source: own study)

Measure	Coding	Range of values
Score 1	Correct answer = 1 Incorrect answer = 0 Don't know answer = 0 Prefer not to answer = 0	From 0 to 3
Score 2	Correct answer = 0 Incorrect answer = 1 Don't know answer = 0 Prefer not to answer = 0	From 0 to 3
Score 3	Correct answer = 0 Incorrect answer = 0 Don't know answer = 1 Prefer not to answer = 1	From 0 to 3

Our research strategy provided for two steps. Firstly, we compared the significance of gender differences in the DL test results. We applied two general approaches to assess the results: (i) for each gender group we calculated the share of respondents who answered the first (second, third) question correctly, the share of respondents who answered all questions correctly, and the share of respondents who answered all questions incorrectly, as well as (ii) for each group we estimated the means of Score 1, Score 2, and Score 3. To check the significance of gender differences in results obtained through the first approach, we applied chi-squared and Cramér's V tests. U Mann-Whitney test was used when evaluating results obtained through the second approach. The selection of the tests was preceded by a standard analysis of these tests applicability to the properties of examined datasets (Szweđ, 2008).

Secondly, we used Score 1 as the dependent variable in a series of logistic regressions. The regressions were conducted to rule out the possibility that gender differences found in the DL test scores due to non-parametric tests were driven by factors other than gender. Previous financial literacy literature suggests that some sociodemographic characteristics (e.g. education, age, income) are strongly related to measured FL levels (e.g. Alessie, van Rooij & Lusardi, 2011; Klapper & Panos, 2011; Sekita, 2011). To control for the effects of these other factors, we estimated two regression models for an entire sample including gender as a key diagnostic variable, however distinct in terms of the other factors (without and with them – Model 1 and Model 2). Model 3 and Model 4 were estimated separately for males and females. Table 4 reports the results of estimated logit models.

Additionally, we used these results to investigate the factors responsible for DL (in terms of Score 1) among all respondents, and – particularly – among males and females. In running the models, we applied a broad gamut of potential independent variables (see Table 5 in Annex for details). Some of them deserve brief explanation (particularly those that turned out to be significant in our regressions). MAJOR was measured through respondents' self-reports of their major of study (=1, if the respondent reported non-business; =0 otherwise). EXPERIENCE 1 was generated as a binary indicator equal to 1 should respondents worked while studying, 0 otherwise.

Grade orientation (GO, hereafter) and learning orientation (LO, henceforward) indices were estimated in accordance with the approach developed by Roedel, Schraw and Plake (1994). Academic orientation reflects an individual's motivation to study for its own sake (LO), or to achieve better grades (GO). We do not provide details regarding LO and GO estimation to keep the length of this article within required boundaries (see Roedel, Schraw & Plake., 1994 for details). The variable GO (LO) were coded in the following way: =1 if respondent's GO (LO)>sample median; =0 otherwise. TUITION was estimated with the following 'Yes / No' question: 'Do you pay for your studies?' (Yes=1, No=0). SCHOLARSHIP (for academic performance) was estimated in the same way, based on the following question: 'Do you have a scholarship?' (Yes=1, No=0).

Results

Table 5 (Annex) provides a numerical description of our sample. Female respondents were overrepresented in the sample, as has been the case in prior studies focused on university students (e.g. Chen & Volpe, 2002; Hanna, Hill & Perdue, 2010; McCabe, Butterfield & Treviño, 2006). In terms of age, our sample was dominated by young individuals – an observation that corresponds with common sense and the division of the sample between full-time students and part-time students (60.5% and 39.5%, respectively). Regarding the countries that participated in our study, almost 53% of respondents filled out the questionnaire in Poland (this resulted from the fact that the project was administered remotely from Poland and, consequently, as many as seven Polish universities joined the research). The other extreme is Bulgaria, represented by a mere 16 respondents. Such a distribution of our sample in terms of the country in which the survey was conducted might have caused a bias in the results. In terms of major of study, business students represented 73.6% of the total sample, while non-business students – 26.4%.

Our survey revealed gender differences in some sociodemographic and economic attributes in the sample we explored. Firstly, women reported the possession of a financial product less frequently than men (68.3% vs. 79.8%), and even less frequently – the possession of a loan product (51.3% vs. 64.4%), an indication of lesser experience with financial markets on the part of female students. Interestingly, more business and finance major students were among women than among men (76% vs. 69.6%). Also, women reported that they didn't pay for their studies and that they were receiving a scholarship for the academic performance more frequently than men (23.9% vs. 19.0%, and 18.8% vs. 13.2%, respectively). Finally, women more often represented village and smaller towns, while men more often reported larger towns and cities as their place of residence.

On the most general level, our results evidence very low financial literacy among students, including those majoring in business (though, the latter fared slightly better than the rest in DL test). The mean Score 1 for entire sample reached a mere 0.84 on a scale from 0 to 3.

**Table 2. Descriptive statistics for the variables significant in logit models
(Source: own study)**

	Mean	Median	Minimum	Maximum	SD
Gender	0.37	0.00	0	1	0.483
Country 1	0.53	1.00	0	1	0.499
Country 2	0.02	0.00	0	1	0.124
Country 3	0.10	0.00	0	1	0.295
Country 4	0.29	0.00	0	1	0.452
Country 5	0.08	0.00	0	1	0.264
Major	0.26	0.00	0	1	0.441
Experience 1	0.63	1.00	0	1	0.482
LO	14.61	15.04	5.135	18.609	2.670
Tuition	0.78	1.00	0	1	0.415
Scholarship	0.17	0.00	0	1	0.373

Table 3. Results of debt literacy test (Source: own study)

	All	Male	Female	Test of difference between genders
AC (%)	2.5	4.3	1.4	$\chi^2 = 7.724$, $V = 0.088$ ($p = 0.005$)
AIC (%)	42.2	26.5	51.7	$\chi^2 = 60.947$, $V = 0.247$ ($p = 0.000$)

AC (all correct): the share of respondents who answered all questions correctly; AIC (all incorrect): the share of respondents who answered all questions incorrectly; FC (first correct): the share of respondents who answered the first question correctly; SC (second correct): the share of respondents who answered the first question correctly; TC (third correct): the share of respondents who answered the most difficult question correctly (i.e. third test question).

Table 3 shows the result of non-parametric tests used to gauge gender differences in DL levels among our survey participants. The tests corroborated that in terms of standard DL measure – Score 1 – women were less debt literate than men. The gender differential in DL was found regardless of studied country, reported college major (business or non-business) and age cohort. Also, our study showed that females were more likely than males to provide DK or PNTA responses to each question of DL test. Overall, 15.8% of females and 5.9% of males provided one of those responses in all test questions. We found Score 3 – measuring frequency of DK and PNTA answers – double as much for women compared to men. However, we found only a slight and statistically insignificant

difference in Score 2 – used as a proxy for the combined effects of guessing tendency and overconfidence – between males and females.

Males responded correctly all test questions three times more often compared to females. Simultaneously, females responded incorrectly to all test questions almost two times more often compared to males. Moreover, male students performed significantly better than their female peers in terms of the first and the second test question. Interestingly, the difference in male and female students' responses to the third test question – deemed the most difficult one – was insignificant.

The results of our logit models confirmed gender differences in DL indicated by non-parametric tests. We found that gender was significantly and positively linked to DL level as measured by Score 1 with and without controlling the effects of other variables potentially explaining the level of DL (Model 2 versus Model 1). All estimated models are characterized by high overall fit (measured by correct classification coefficient). Model 2 indicated three variables significantly related to Score 1, apart from the variable GENDER, namely: MAJOR, COUNTRY, and TUITION. The sign of the relationship between MAJOR and Score 1 was negative in Model 2, indicating that business students were more debt literate than their non-business peers. We found country among the independent variables the most strongly associated with DL of both genders. In terms of the odds ratio, non-business students had almost 40% fewer chances for high Score 1 compared to business ones. Model 2 also showed that Polish, and especially Ukrainian, students were substantially more likely to score well on the DL test in comparison with Welsh students (reference group). As shown in Table 4, TUITION was positively linked to Score 1, meaning that students who paid for their studies ended up with higher Score 1 compared to those who were exempted from the tuition fees. According to the odds ratio, students paying tuition had almost 80% higher chances for higher Score 1 than their tuition exempted peers.

Models 3 and 4 allowed us to examine whether male and female students' Score 1 responds similarly or differently to potential independent variables other than gender. We noticed a significant difference between males and females in the role of a college major for DL. This variable was insignificant in the model explaining DL of males (Model 3), while significant in the model performed for females (Model 4). Female students majoring in business scored significantly better in DL test compared to their non-business female peers. In terms of the odds ratio, non-business female students had almost 50% lower chances for high Score 1 compared to their business female peers.

Another important difference between genders was found with respect to effect scholarship had on DL. Females who were awarded scholarship were also more likely to display higher DL level as compared to their counterparts not receiving scholarship. In terms of odds ratio, female students receiving the scholarship had almost 80% bigger chances for higher DL test score in comparison to their female peers not receiving the scholarship. Again, such an effect was not found among male students.

In light of the results brought by Model 4, female students who worked while studying were more likely (with almost 40% more chances) to score well in the DL test than their non-working female peers. On the other hand, Model 3 showed that more learning-oriented male students had almost 10% more chances for high Score 1 than their less learning-oriented male peers. Finally, in terms of the country, Polish and Ukrainian male students had significantly higher chances for high DL test results compared to Welsh students, while female Portuguese students were significantly less likely to perform well on the test in comparison with the reference group.

Discussion, limitations and concluding remarks

In many respects, the results of our research are consistent with the findings of former authors. We corroborated that females who participated in our study were less likely to give correct answers to DL test questions and more likely to choose DK or PNTA options – the patterns well-recognized in previous studies (Lusardi & Mitchell, 2014; Klapper et al., 2015; Bucher-Koenen et al., 2017). Although we were not able to fully control for the combined effects of guessing and overconfidence, our results suggest that higher DL of males can't be simply explained by a higher inclination to guess in the DL test, or men's overconfidence in own financial sophistication, in comparison to women's.

Our finding on the role of major for the gender gap in DL – which is in line with results of Chen and Volpe (2002) who found that college major had a stronger effect on females' FL – suggests that, unlike women, financial education may be less relevant for men to become financially literate. Males seem to acquire financial literacy somehow differently. This may mean that financial education programs addressed to women are particularly needed. This may also support the claim of Bucher-Koenen et al. (2017) that females and males are characterized by different patterns of FL acquisition in which past

experiences can have a critical role. This belief seems to be convincing as self-reports of our respondents revealed that male students were more financially experienced, i.e. male students reported the use of financial products more frequently than female participants.

What we noticed in terms of the effect scholarship had on DL of male and female participants in our study may, in turn, support the theoretical proposition of Jappelli and Padula (2013) who posited that individuals need to have incentives to build FL. In light of our findings, awards such as scholarship seem to motivate female students to increase their debt literacy. We did not find evidence that male students responded to scholarship-related incentives in the same way. This gender difference may be consistent with the rationale formulated by Agnew and Harrison (2015) who posit that the decision to study should be considered an investment decision which must take into account not only the opportunity cost of a student's time and tuition costs but also an estimate of future returns on the investment. Aware of pay inequalities in the labor market, female students may attach greater importance to scholarship as a component of the return on the investment in the university study.

The interpretation of country results in terms of the gender gap in DL poses a challenge. Among countries examined in our study, Ukraine exhibited the greatest difference between males' and females' means of Score 1 and Score 2. However, this is the only regularity found in our study with regard to the link between country and gender gap in DL. Perhaps, the finding can be explained by particularly strong femininity (or, alternatively, weak masculinity) as a cultural feature in Ukrainian society, as documented by Hofstede (2017). Additionally, the results in terms of country cohorts can be distorted because of the sample skewness towards Polish respondents (and extremely low share of Bulgarian participants), as mentioned in 'Method' section of this article. Nevertheless, the association between those two variables deserves a close attention in future research.

On a more general level, we confirmed serious DL shortcomings of university students, including business ones, known from previous studies (Chen & Volpe, 2002; Hanna et al., 2010). Our findings may mean that the actions taken by governments, regulatory as well as educational bodies in response to the recent crisis were not effective, at least in those countries we investigated and with respect to financial education – especially offered to women who are still at a disadvantage in terms of DL compared to men.

Our findings must be interpreted with consideration of the potential bias resulting from the fact that some key variables were self-reported and, as a result, may be overestimated because of social desirability. Also, our survey was based on a convenience sample suffering from shortcomings typical for non-representativeness. However, the convenience sampling procedure is a standard in large-scale studies in populations of students. Nevertheless, a study of students' debt literacy, based on a cross-national representative sample, would be desirable.

Abstract. *The basic expression of today's decision base in any banking institution or asset management company is risk management. Nothing new would say, its risk and profound implications have been the subject of study since the beginning of the last century when Knight, von Neumann, Morgenstern, or Arrow prefetted this field. And yet, why today, more than ever, does everything go from interpreting it in a way that becomes almost obsessive? Often invoked risk management motivation leads us into a banking system that fails to credit the economy, companies have increasingly difficult access to finance, whole sectors suffer, large companies collapse. The question that is naturally born is what has changed in the interpretation of risk in recent years? Can we talk about a subjective element that defines the risk? Referring to modern times, we notice that the barrier that delimits this change of paradigm is 2008, a time that has fundamentally transformed the approach of risk, not necessarily its quantification. This is why we need to address the risk through human behavior with its subjective valences and its implications for decision-makers.*

Keywords: *risk management; human nature; behavioral finance; sentiment; rationality; behavioral biases.*

Introduction

In the fever of finding "logical" explanations on how decisions are made and the financial markets are functioning, the countless evidence of irrational investor behavior has gradually led to the abandonment of some of the dominant concepts of neoclassical finances. Moreover, the idea that the 21st century would be "behaviorist" or not (Thaler, 2000) was accredited. For now, one thing is certain: Behavioral finances are "under construction" and set up as solid support for the vast financial sector. Studies conducted over the past decades have made behavioral finance incorporate standard finances, re-introduce them into new concepts and establish connections between theory, demonstration and practice. Statman (2014) notes an essential aspect: Behavioral Finance puts normal people in place of rational people in standard finances.

In the mirror, the two disciplines are based on four symmetrical pillars, the behavioral finances representing the alternative for each of them (Statman, 2014, p.65):

Standard finance assumes that:

1. People are rational;
2. Markets are effective;

3. People should design portfolios based on the average variance rules within the portfolio theory;
4. The expected return on investment is described by the standard pricing theory of the standard assets, where the expected return on profit is determined only by the differences in risk.

Behavioral finances assume that:

1. People are normal;
2. Markets are not effective, even if they are difficult to defeat;
3. People design portfolios based on the behavioral theory;
4. The expected return on investment is described by the behavioral theory of asset pricing, in which case the expected return on profit is determined by many more elements than the risk differences.

De Bondt states that behavioral finances, in turn, rely on three main pillars: feelings, behavioral preferences and arbitrage limits (De Bondt et al., 2008). The authors point out that sentiment is understood as investors' mistakes, but similarly, these errors are also found in the market. In other words, behavioral finance models classified individually generate results at the macro level, which is why, in the literature, studying distortions (biases) has been revealed in Behavioral Finance Micro and Behavioral Finance Macro. Micro Behavior Finance analyzes the cognitive biases or biases of individual investors that differentiate them from rational investors targeted by classical economic theory. Macro behavioral finance detects and describes anomalies in efficient market theory as behavioral patterns that may be explained (Pompian, 2006). In the case of macro-behavioral macroeconomics, the discussion of specialists goes around the question: "Are efficient markets or are they the subject of behavioral effects?" As far as micro-behavioral finances are concerned, the subjects turn around the dilemma if individual investors are perfectly rational or cognitive and emotional errors affect their financial decisions. Psychologists explain that these errors are due to the fact that people's beliefs are often subjected to cognitive illusions.

The human society is based on moral and ethical standards. To understand the relationships among people we need to explore the human nature and inevitable we'll find the importance of the sentiment. The risk is seldom triggered by human sentiment and to understand it we need to understand the way people approach it.

"Economics is a social science studying the behavior of people when they are involved in production and exchanges. Predictive models about prices or about market tendencies are run with high errors and uncertainty." (Păun, 2016, p.1) Due to the free will of the human nature, we can state economics doesn't have a great level of predictability, which translates into a risk environment. On top of that, there is always the state intervention who significantly alters the normal course of the economy.

A new approach from the perspective of ... difficult to assess situations

The recent literature on behavioral finance suggests that investor sentiment may greatly affect the value of earnings in the case of financial securities. The effect is felt to a greater extent in the case of financial titles that are difficult to assess and/or difficult to arbitrate, such as small, "young", unprofitable or high-yielding securities. When investor sentiment is high, the return on these types of titles tends to be relatively low, and vice

versa, in the case of low emotional states. The causes of fluctuations in investor sentiment vary and in some cases may be quite banal. Hirshleifer and Shumway (2003) have collected evidence of the daily returns of 26 capital markets in the world that show that they are affected by the cloudy weather in the city that runs the stock market in the country. Kamstra, Kramer, and Levi (2003) provide similar evidence, showing that investor sentiment, risk tolerance and asset returns in different countries are influenced by the low hours of light in winter, probably resulting from seasonal affective disorders.

Implications for investors' decisions

Theoretically, it is appreciated that investors are able to gather relevant information and evaluate them objectively. In reality, there are a number of mental and emotional factors that are difficult to separate into an analysis system. Sometimes these factors can lead to good results in the decision-making process, but it is also possible to reverse the situation. Following countless observations and tests, researchers have been able to demonstrate that, most of the time, people's beliefs are predictable on deformation of decisions. In most cases, the source of the problem is cognitive. The decision-making process by which investors discover things by themselves, usually by trial and error, leads to the development of general rules of assessment or rules of good sense ("rule of thumb").

According to Ritter (2003), behavioral finance is based on psychology, which suggests that human decision-making processes are subject to more cognitive illusions. These illusions are divided into two groups: illusions caused by heuristic decision-making (representativeness, trust, anchoring, player error, availability), and illusions generated by the adoption of mental frames grouped in prospective theory (aversion to loss, aversion to regret, mental computation, self-control).

The authors of the article *Role of Behavioral Finance in Investment Decisions* (De Bondt et al., 2008) characterize behavioral biases in three main categories: a) feelings: anchoring, representativeness, availability, excess trust; b) preferences: aversion to loss, mental calculus, myopia of aversion to loss, self-control, aversion to regret; c) limits of arbitration.

Backer (2010) performs another type of classification, listing four major thematic categories in which the factors affecting investment decisions fall. The first category focuses on heuristics, where the author lists the distortions that may affect the decision-making process: affection, representativeness, availability, anchoring and adjustment, familiarity, exaggerated trust, status quo, aversion to loss and regret, aversion to ambiguity, conservatism, and mental computation. Framing is the second category by which Backer believes that people's perceptions of the choices they have to make are heavily influenced by the way these options are framed, even if the objective situations remain constant. Emotions, the third category, include unconscious/unknown needs, fantasies, and fears, which also play an important role in making financial decisions. The book analyzes the relationships between the investor's condition and investment decisions under the influence of weather, sun, sports events. The impact on the market is the last category to analyze the effects of cognitive errors and individual distortions or groups of people that may affect capital market prices.

Pompian (2012) analyzes behavioral biases and their implications for making financial decisions from the perspective of cognitive errors and emotional deviations. In the first category, the author classifies: a,) distortions of persistent beliefs: conservative distortions, confirmation, representativeness, the illusion of control, retrospective, cognitive dissonance; and b) distortions of the information process: anchoring, mental computation, framing, availability, self-attribution, outcome, recent experience.

Dealing with distortions of investor behavior in decision-making

According to the author (Pompian, 2012), persistent beliefs in the context of behavioral biases are the tendency of people to cling to a situation that has previously occurred or that has recently created irrational or illogical beliefs. Investors seek to justify their beliefs because of distrustful confidence in themselves or in their own ideals or abilities. The distortions of the information process show how people process the information, logically or irrationally, into the decision-making process.

Emotional distortions are the second category defined by Pompian. These can cause investors to make ineffective decisions. Emotional distortions are more difficult to correct than cognitive errors because they stem from impulse or intuition, rather than from conscious computations. Because emotions are rarely identified and recorded in the decision-making process - they have to do with how people feel, rather than what they think and how - the researchers have found fewer distortions. The seven emotional distortions discussed in the above-mentioned paper (Pompian, 2012) are an aversion to loss, exaggerated confidence, self-control, status quo, endowment, aversion to regret and affinity.

Nair and Antony (2015) appreciate that four of the major themes in behavioral finance are: a) heuristics; b) framing; c) emotions and d) market impact. In the first category, the authors say that more than 50 biases were identified, among the most often represented representativeness, availability, anchoring and adjustment, familiarity, over-confidence, status quo, aversion to regret, aversion to ambiguity, conservatism and mental computation. Framing deals with how people encode events. Framing separates the background shape and therefore deals with perceptions. The framing was defined by the authors as a point of view of the decision maker on possible problems and outcomes. In the category of emotions are listed: fear, hope, anger, regret, pride, care, guilt, and mood. All these emotions determine the level of risk tolerance of investors. The higher the level of complexity or uncertainty, the greater the emotional impact. The impact on the market refers to the process of choosing alternatives to investment, a process that can be influenced by new information. Under these circumstances, investors' decision may suffer an incorrect valuation due to arbitrage limits. This will affect the market price, generating deviations from the fundamental values. These are the main anomalies that lead to the discussion of the efficient market hypothesis.

The list of titles can continue with various classification ranges, from author to author. However, the methodological aspect is less important for understanding the distortions of investor behavior in the decision-making process. Relevant are remarks and recommendations on how all these behavioral distortions can be identified and managed to limit the impact on investment decisions and the stock market.

Among the most known cognitive biases, representativeness, over-confidence, anchoring, betting error, availability of deformations are models that, in the heuristic decision-making process, have gathered around them countless examples of investor practice.

The level of risk tolerance of the investor

Aversion to loss is an argument for understanding and explaining the tendency of investors to keep their losses and to sell their gains too early. Shefrin (2000) called this distortion (bias) "mood effect". The hypothesis was supported empirically by data collected by Odean (1998), which analyzed the transactions for 10,000 accounts from a brokerage house. The results showed that the investors kept the shares on the loss for 124 days on average, while the shares on the win were kept on average only 104 days. With the help of an experimental term market, Heilmann et al. (2000) were able to demonstrate that the number of assets offered and sold was higher during periods of increase in trading prices than in periods of declining trading prices. This risk aversion to gains, which leads to a hurried sale of shares, directly leads to a fall in prices relative to the core values. On the other hand, the fall in share prices will cause investors to resist too much time in making a trading decision, which will cause stock prices that have had a negative momentum momentarily to exaggerate their core values. Studies show that the level of risk tolerance of the investor fluctuates with changes in the stock market. As a rule, investors use the open market price to build their attitude of risk tolerance.

Although the importance of assessing financial risk tolerance is well documented, in practice the evaluation process tends to be very difficult due to the complexity of the concept and the subjective nature of risk taking. Carducci and Wong (1998) conducted research to identify personality factors that can influence the assumption of financial risk. They suggested that investigating the factors that determine financial risk and risk tolerance can be extended beyond testing purely psychological factors. Demographic, socio-economic and attitudinal characteristics are essential factors to consider in determining how a person's behavior influences the financial risk assumption.

Specialist literature supports this idea with countless results related to factors of influence such as gender, age, education, marital status, occupation, income, race, ethnicity, etc. Slovic (1966, p.169) says that "a predominant belief in our culture is that men should, and even do, take higher risks than women." Countless studies show that the level of tolerance to risk is inversely proportional to age but directly proportional to the increase in the level of studies and incomes. Wang and Hanna (1997) examined the relationship between age and risk tolerance based on data collected from the consumer credit survey between 1983-89. The authors developed a life-cycle hypothesis by measuring the risk tolerance by the ratio between the asset's risk and the total wealth/wealth. This was defined by combining human capital and net wealth. By analyzing the descriptive tools, the authors suggest that risk tolerance increases with increasing age.

Individuals, compared to married ones, have a higher level of risk tolerance, as are people with a high occupational status or a higher level of knowledge in the field of investment.

Conclusions and implications

As can be seen from the various studies mentioned above, the risk concept has multiple dimensions depending on the approach of the approach. Assuming risk is dependent on context and context. Gooding's studies (1975) on investor perception of risk and return on ordinary financial securities reveal significant differences between professional and non-professional investors. That's why people's willingness to take risks must be analyzed and evaluated in context. There is no best or only way in which attitude to risk can be assessed or predicted, anticipated.

The investor has to establish from the very beginning what kind of risks he can assume, what are the objectives he is pursuing and what are the constraints to which he is exposed. Investor needs and financial market expectations are the focus of investment strategy building. Depending on economic dynamics, political, social, environmental or demographic changes, portfolios management will constantly require careful monitoring and continuous adaptation to the requirements or expectations of the financial market. Investment policy will allow for accurate analysis and assessment of the performance achieved in this management, based on the benchmarks adopted: the benchmark portfolio or the standard performance objectives. The reference portfolio reflects the investor's risk preferences and corresponding returns. In turn, standard investment performance should be compared to this benchmark portfolio. For example, an investor seeking low-risk and high-risk investments should compare the standard investment performance set with that of low-risk and high-risk portfolios.

The most appropriate allocation of assets within a portfolio (i.e. which asset classes and in what amounts) depends on the investor's objectives and on the constraints inherent in such a way as to ensure the necessary congruence with the characteristics of the allocation (strategic and tactical) and, of course, its behavior.

Abstract. *The Smithian concept of homo oeconomicus is placed in the forefront of all economic approaches, because by being perceived as perfectly rational, selfish, free, competitive and social, this opens the corridor of theoretical and empirical developments that will enrich the field of fiscal behavior. The analysis of the personality of the Smithian economic agent from the tax perspective leads to the conclusion that these features are not verified under the conditions of the market economy. Thus, in theory, the perfect rationality of homo oeconomicus would mean that each taxpayer would avoid the payment of tax liabilities, and the generalization of this behavior would lead to the impoverishment of the state treasury. Also, the reality contradicts the validity of the latter two features because the market economy is not characterized by perfect competition (i.e., see tax monopolies), and most taxpayers comply with legislation, although their income is affected by existing tax levy. The joining of the two realities - an anthropological, another economic - with all the truth they contain, sets the attitude towards taxes in the sign of the gloom, the reluctance, and the anguish. The risk of taking over and repeating such messages, whether voicemail or not, is to create in the collective mind some dangerous behavioral prejudices, a kind of Pascal's abyss, an abyss between the taxpayer and the authorities, all ending with frustration, repudiation and ultimately avoidance of tax obligations. Although the importance and value of tax payments are undeniable, we do not consider the exuberant apologetics of tax obligations to be appropriate, but we do not even think that we should be discouraged in the face of a fatalist rhetoric. We rather think that the discourse on tax obligations and their payment must be balanced and rational, giving the prospect of a call for taxes, taxes, and contributions, on the one hand, and responsibility for implementing an effective fiscal policy, on the other. The central objective of the paper is the presentation of some benchmarks in the evolution of fiscal behavior in order to understand the forms covered by the tax obligations and the transformations recorded over time by the taxpayer interaction of the authorities.*

Keywords: taxes; fiscal behavior; taxation; tax obligations.

Introduction

The concept of "culture" is extremely comprehensive, managing to capture the attention of various categories of researchers, from anthropologists, philosophers, socio-psychologists, political scientists to financiers. The British anthropologist Tylor (1871) formulates one of the first definitions attributed to culture: "Culture or Civilization, viewed in its comprehensive ethnographic meaning, is the complex that includes knowledge, faith, art, morality, law, habit, capacities, and habits accumulated by man as a member of society". At a distance of a century and a decade, Hofstede's vision (1980) on the concept includes "collective mind programming that distinguishes members of a human group from those of another group". From the interior of the Romanian space, Vasiliu (2001) considers that this "consists of getting everything you lack, of learning everything you do not know", and Pohoacă (2000) characterizes culture", as a summum of knowledge, traditions, customs, mental and practical attitudes, all of which have a single purpose - dualistic, material and spiritual civilization. "

The feature that emerges from most of the definitions attributed to culture is that it embraces elements by which a particular community distinguishes itself from others. By narrowing the broad spectrum of the concept, we will focus our attention on tax culture as a dimension that also shapes the mood of conforming to a tax system. Being an important source of government spending and a leverage in the adjustment of the economy, taxes are an expression of the tax culture present in each state. In addition, in their comprehensive federal tax paper, Murphy and Higgins (2012) mention the words of American tax consultant Karen Yeager who said: "Every company chooses tax systems that not only generate the revenue needed to finance government spending, but this choice reflects inherent in societal values. A company chooses not only the tax system, but the tax system becomes one of the basic institutions that shape society. " The classic view of the concept of "fiscal culture" (Schumpeter, 1929) implied the restriction of the concept to the creators of the tax system (i.e. tax authorities), and some recent approaches accentuate the importance of taxpayers (Camdessus, 1997) or communication with tax authorities (Martinez-Vasquez & McNab, 2000; Martinez-Vasquez & Wallace, 2000). While identifying some aspects of the concept, the above-mentioned visions are too restrictive because they ignore essential elements such as the influence of the country's historical path on the fiscal system or national culture (Nerré, 2008). From a fiscal point of view, the tax culture includes a fiscal system, tax practice, the uniqueness of taxpayer interaction and the awareness of this uniqueness (Frey & Holler, 1998); (Berkowitz & Li, 1999; Blanchard & Shleifer, 2000; Shleifer & Treisman, 2000; Treisman, 2000). Accepting the idea that the uniqueness of the tax system of each individual, the tax system and the degree of decentralization, the strategies of combating tax evasion or the various interest groups state, region or even the continent is given by the tax culture, the "architecture" of the concept in its own vision contains a number of detailed aspects below.

Although the geostrategic positioning of a country may seem a geographically less relevant detail in this case, it is important if the neighborhood with a beneficiary state of an efficient tax system determines the coordinates of its own tax system. Territorial isolation may also have positive influences (preserving the uniqueness of fiscal behavior) or negative (the implementation of a rudimentary fiscal system) (Ajzen, 1991).

The way in which taxpayers relate to the tax system is also determined by the political regime of a state (Ajzen, 1993). In general, democratic regimes record higher values of voluntary compliance than socialist regimes, where compliance is almost entirely forced. A prominent example of fostering forced compliance comes from China, where the Socialist government introduced the one-child policy (except Hong Kong and Macao) specifically in 1978 to control the negative natural growth (i.e. one million births per five weeks). In this respect, employers pay their family planning contribution of 0.8%, and non-conforming citizens are sanctioned by fine, property confiscation, and even job loss. The latest data indicate a moderation in the above-mentioned practices in that the Beijing government would allow citizens to have two children from 2015. The level of trust in the authorities is influenced by the type of political regime and determines the climate of interaction between taxpayers and authorities. Trust in the fellow, as shown in the second chapter (see socio-psychological factors), can stimulate or stop the perpetuation of non-conformance behavior. In general, citizens of the democratic states report higher levels both in-state representatives and in other citizens than non-democratic states. Sources used are Edelman Trust Barometer 2012 and Eurobarometer (Alligam & Sandmo, 1972).

There is a continuing debate between direct and indirect taxation on the advantages and disadvantages of the two systems when balancing the revenue generated and the cost of compliance. Each state determines the extent to which it is subject to direct and indirect taxes. Usually, in the regions that mainly incorporate developed countries, the share of income generated by direct taxation (i.e. income tax, wealth, etc.) in total budgetary revenues is higher than the share of indirect tax revenues (i.e. general or special taxes consumption). According to the "slippery slope" model, the climate of interaction between taxpayers and the authorities can be: antagonistic or synergistic (Alm & McClellan, 2012). Generally, democracies traditionally benefit from a synergistic climate that ensures a high level of tax morality (e.g., see Switzerland, Austria, Germany, Australia, etc.). The underground economy (ES) and the corruption index (IC) are inextricably linked, so states with high levels of the underground economy also "enjoy" generalized corruption. For example, countries such as China, Romania, Russia, where specific socialist networking practices (e.g., *guanxi* or *blats*) are grounded for personal gains, face 20% underground economy, 32.6%, respectively 41.7% of GDP and the levels of corruption perceived by 39 (80th), 44 (66th) and 28th respectively (133rd) according to the Transparency International Corruption Perceptions Index 2012 (TICPI) determined for 176 countries and territories worldwide. The TICPI index expresses the level of corruption perceived in the public sector (i.e. bribery of local and central authorities, public money stamping, public procurements in favor of interest groups, the inefficiency of corruption eradication actions) and has values ranging from 0 (very corrupt country) and 100 (very clean country). The data on these two issues will be taken from the TICPI 2012 and Schneider, Buehn and Montenegro (2010). Hoanda (1997) notes that "the international geography of fraud demonstrates the planetary spread of the phenomenon that encompasses all countries, either heavily developed or developing, located north or south, east or west," and the differentiation of countries consists of "the severity of the disease and the treatment applied" (Tulai, 2003). Tax Authorities adopt different anti-fraud strategies, ranging from the most common (fines, imprisonment) to the most ingenious (overflowing properties for measurement, monitoring of alcohol production via electronic devices), from frugal strategies (regular tax inspections) to extremely expensive operations (surcharges, interventions with special troops), from stimulating cooperation (reductions, exemptions, tax amnesties)

to capital punishment. According to Huntington (1997), cultures change under the implausible passage of time, and their impact on fiscal behavior varies from one period to another.

Thus, the historic path of a state - the economist Paul Samuelson notes - is mirrored in its fiscal policy, because fiscal obligations and budget expenditures are two key levers owned by the government. Generally, states that at one time had the status of a colony borrowed from the fiscal culture of domineering power either fiscal discipline or ways of circumventing the law. The principles and norms rooted in the religious beliefs of different nations determine the altitude of tax morality and taxpayers' attitude towards tax fraud.

The behavior of taxpayers and tax authorities as an expression of their interaction

Starting from one of the previously developed etymological concepts, a personal definition of tax behavior will now be given. Thus, tax behavior or taxpayers' behavior is how they, under the influence of endogenous and exogenous factors, choose to act against fiscal obligations, react to fiscal policy and interact with other taxpayers and tax authorities. From the definition, it is deduced the idea that fiscal behavior manifests itself in a three-dimensional hypostasis. The way in which a taxpayer acts and reacts to fiscal obligations and fiscal policy reveals how he manages his emotions, perceptions, attitudes, and translates them into the plan of tax decisions. We have called this way the hypostasis of the introspective dimension of fiscal behavior (Croson & Buchan, 1999). The way the taxpayer interacts with other taxpayers' devotions that their actions affect and are affected by their actions. This can be called the hypostasis of the horizontal dimension of fiscal behavior. And how they interact with tax authorities reveal a taxpayer's reporting to higher-level entities. Here we can talk about the hypostasis of the vertical dimension of fiscal behavior. These multiple hypostases speak of the complexity of fiscal behavior (Tsakumis, Curatola & Porcano, 2007).

Referring back to the etymological understanding of the concept of fiscal behavior, the question now arises: What happens when the taxpayer brings positive or negative attitudes into the "topos" or "space" of interaction with other taxpayers and tax authorities? The manifestation of positive attitudes towards fiscal obligations can generate tax compliance behavior, while negative attitudes indicate fiscal noncompliance. Franzoni (2000) teaches us that in order to comply with the fiscal rules, we must cumulatively fulfill the following four conditions:

- 1) Not to fully report the earnings obtained;
- 2) Determine correctly the value of tax liabilities;
- 3) Submit tax returns in time;
- 4) And pay in time. In the literature, two types of behavior were validated for compliance: voluntary and forced (imposed).

Kirchler, Hoelzl and Wahl (2008) explain what it means to comply voluntarily or forcibly.

So we voluntarily comply if we have paid our tax obligations on the basis of moral reasons, state support, fulfillment of citizenship duties. We comply with our duty or impose when we pay our tax obligations in the desire not to bear the negative consequences of non-payment. The mobile trigger for voluntary compliance is

confidence in the authorities (Muehlbacher, Kirchler & Schwarzenberger, 2011; Muehlbacher, Kogler & Kirchler, 2012), and the perception that the authorities use their power to carry out controls, detect fraudsters and punish taxpayers to comply (Clark, Friesen & Muller, 2004; Kramer, 1999; Wahl, Kastlunger & Kirchler, 2010; Muehlbacher, Kirchler & Schwarzenberger, 2011). Both voluntary and forced compliance require respect for the letter and spirit of the law (James & Alley, 2002).

Violation of any of the compliance conditions results in non-conformance behavior. Fiscal non-compliance has two forms: licit non-compliance, known as licit tax evasion or law-enforcement and illicit non-compliance, called tax fraud. Although the Romanian legislation does not distinguish between the two forms, this distinction exists in the literature (Cummings, Martinez-Vasquez, McKee & Torgles, 2009). In the Anglo-Saxon vocabulary lawful tax evasion is called tax avoidance, and tax evasion tax fraud. In addition, Seldon (1979) patented the term tax avoision, a camel born from combining the terms of avoidance and evasion ("avoi-" + "-sion"). It refers to the fact that there is no economic distinction between legal evasion and fraud, but only legally and morally (Freedman, 2004). The question now arises: to what extent, how many times and what types of tax liabilities are the taxpayer going through the negative attitudes in the interaction with the authorities and other taxpayers? Here I will offer three areas of interpretation. In the first, we find the taxpayer who can only once show the refusal to pay a tax liability, in which case the fraud is singular, and the situation is like a one-round tax game. If he repeatedly displays this refusal, we talk about repeated tax fraud and a situation like a repeated tax game. In the absence of fiscal control, this repeated situation is effective for the taxpayer but damaging to the state that loses by generalizing it due to late detection and partial sanctioning. In the second area of interpretation, a taxpayer can partially escape by paying only a quantum of tax, the fraud being partial, or it can totally avoid, the fraud being total. The state is widowed by higher financial resources, and the taxpayer gains more in total fraud (excluding the hypothesis of tax control). Thirdly, the taxpayer can escape from: paying a single type of obligation, tax fraud being restricted or specific or honoring all tax obligations, fraud being generalized or scandalous. In the following figure, the six types of tax fraud (in the center column) and the eight combinations that can take place in practice (the left and right columns) are surpassed.

The government behaves like a large business with a multitude of debts and expenses. To control the costs, he had to create revenue. Because the government does not generate revenue on its own, it needs to find a way to pay its bills. The money used by the government to pay these invoices comes largely from tax obligations (La Bella, 2011). But as in any business, its owner is dependent on its customers and suppliers, and an essential condition for the business to thrive is that the owner (and the government) behave appropriately and professionally towards these partners, taxpayers, and taxpayers. Finally, "a business-friendly fiscal system can only be built on transparent and effective dialogue between the legislator and the taxpayer" (Deloitte Tax, 2009).

The radiography of tax culture: A trip around the world in 30 countries and five continents

Anticipating the most comprehensive empirical study of the paper, I group the 30 sampled states taking into account the typology of tax culture and the components of this concept (Feinstein, 1991).

Continental fiscal culture: the essence of conservatism

Continental fiscal culture is shared by high-growth states, high-quality public goods, and a highly-performing social protection system. Although the level of direct taxation is very high, accounting for almost half of the taxpayer's income, morality is very high, as evidenced by the low level of underground economy and the implementation of a customer service climate. Among the countries surveyed, Switzerland is highlighted by a number of issues: it is the only country in the sample to implement direct democracy; has the highest level of morality (Feld & Frey, 2002); has the status of a tax haven due to the facilities granted to investors and the preservation of banking secrecy, encouraging tax evasion. In order to avoid including OECD non-cooperative states, the Swiss authorities have concluded treaties on the exchange of tax information with more than 30 countries, refusing for the time being to ban banking secrecy.

Anglo-Saxon taxation: tax under Union Jack and Uncle Sam

In turn, the Anglo-Saxon tax culture emphasizes the importance of implementing a service-client environment (with few exceptions) and the prevailing use of direct taxation (Mumford, 2001). Australia stands out as one of the first states to take steps to change the taxpayers' approach, which has brought it a leading position among the least corrupt states. By creating the ATO model, the Australian tax has proposed to replace the universal approach (e.g., "all taxpayers are offenders") with one tailored to the taxpayer's specificity.

Mediterranean tax culture

The Mediterranean fiscal culture is shared by states with a high level of economic development, a lower level of fiscal pressure compared to representatives of the Renaissance culture, but surprisingly, with a more pronounced propensity for tax fraud (as evidenced by the subterranean economy that averages about 20% of GDP). Negative results are due to inconsistent methods used by authorities to reduce tax fraud and the attitude of these authorities, which often seem to favor tax fraudsters. An example of this is the case for Greek authorities who said they lost the list of the biggest fraudsters received from IMF Director Christine Lagarde.

Scandinavian tax culture: Northern efficiency

This type of tax culture is adopted on a small scale by the Scandinavian Peninsula and Denmark and generates a very high level of economic development, despite the highest level of fiscal pressure (Richardson, 2008). Extremely high morality places these countries in the top seven least corrupt countries in the world. In the case of Sweden, this result is mainly due to the "denunciator law", through which benevolent taxpayers are rewarded if they provide credible information about tax fraudsters.

Eastern European fiscal culture: looking for stability

Eastern European fiscal culture is encountered in the former Communist bloc states, which became independent in the early 1990s. The characteristics of the tax systems within this culture are: exclusive focus on indirect taxation (except for Poland); excessive taxing of labor (high level of social contributions) and inefficient social protection system; a high level of corruption and the underground economy that generates low credibility among authorities; the overwhelming use of coercive measures in favor of stimulating cooperation; low level of tax morality. The authorities in Russia are highlighted by the fact that they do not fall into the category of criminal offenses and punish them only by fine. Because they focus more on reducing the level of mafia-style activities, fiscal non-compliance tends to become a generalized phenomenon.

Islamic tax culture

States that embrace this culture are based on the following principles derived from the Qur'an:

- 1) Zakat: the most important element for the establishment of social justice; applied only to the Muslim population and paid by it as a duty; one of the pillars of Islam, the obligation of his payment included in the Qur'an, without specifying the taxable matter;
- 2) Shame or shame, forbidden by the Qur'an, which encourages direct investment and obtaining dividends from economic activities;
- 3) The stable currency: according to the verse in the Qur'an "and gives everything measured and weighing with justice," honesty and justice in all value evaluations must be based on the Qur'an. The verse applies not only to individuals but also to authorities. Therefore, the state's duty is to provide a sound currency, fiscal policies, and proper control;
- 4) State Responsibility: Developing an Appropriate Framework for Implementing Islamic Laws in Society. The United Arab Emirates emerges as a tax haven (there is no income tax, except for banking and oil extraction) and a state with a free trade area (Jebel Ali port).

Asian tax culture

Unlike the Islamic states that made religious beliefs the spiritual, ideological, political, and economic confluence of reforming changes, the Asians began reforming the state under the impetus of economic growth manifested in the 1950s when the economic boom Japanese post-war "has quickly" boosted the economies of the four "Tigers" (Hong Kong, Taiwan, South Korea, Singapore) and then China, Thailand, Indonesia, and India. The industrialization and economic development of Asia have so deepened in the 1980s and 1990s that it has come to outpace the growth rate of European and American economies. States still report economic performance, despite the fact that the position of governments towards their own citizens was and is a force. Although the methods used are sometimes reprehensible (e.g. capital punishment for tax fraud in China), one explanation is that, according to the authorities, the huge number of inhabitants can be controlled only by a high perception of power. This is where China and India alone have 2.5 billion inhabitants (the third part of the planet's inhabitants). Among the sampled countries is Hong Kong, which has the status of fiscal paradise and is the preferred destination for Western-European millionaires' capitals.

Latin American tax culture

Although direct taxation should generate substantial revenues, the main problem of countries belonging to this type of culture is the extremely low number of taxpayers registered in relation to the total population. Thus, in 2012, Brazilian tax bases included 25 million taxpayers out of 190 million (25% of the active population) and 37 million out of 113 million (10% of the working population) in Mexico. Another issue is the high level of economic crime and corruption, despite the costly efforts of the authorities.

Overview of international comparative studies

The need for intercultural studies for a thorough understanding of differences in tax behavior is highlighted by numerous authors (Struempel, 1969; Schmoelders, 1970; Cowell, 1990; Kay & King, 1990; Elffers et al., 1991; Alm, Sanchez % De Juan, 1995; Schneider & Enste, 2000; Lamb et al., 2004; Tsakumis, Curatola & Porcano, 2007; Richardson, 2008). Robben et al. (1990) present the experimental results of 10 studies conducted on a sample of 674 subjects (students and adults) from Belgium, the United Kingdom, the Netherlands, Spain, the United States and Sweden, focusing on the impact of decision scenarios and the opportunity of tax fraud on nonconformity behavior. In the opinion of the authors, subjects faced with scenarios that would have to pay extra tax after deduction of income tax at source were most likely inclined towards tax fraud. Also, the propensity for non-compliance increased significantly with the emergence of tax fraud opportunities.

Considering the differences of compliance between South Korea and Japan, Hyun (2005) concludes that one of the main determinants of these differences is the level of knowledge of taxation and notes also that Japanese subjects have a higher level of tax knowledge, hence a higher level of tax compliance. Authors such as Roth, Scholtz and Dryden-Witte (1989), Torgler (2005; 2011), Torgler and Schneider (2009) or Daude, Gutiérrez, and Melguizo (2012) the taxpayer. Moreover, Riahi-Belkaoui (2004) studied the link between morality and tax fraud based on data from 30 countries, finally pointing out that tax fraud correlates negatively with stronger economic freedom and moral norms. Concerning the same issue, according to the results reported by Richardson (2006), following research in 45 countries, non-economic factors have the most influence on the propensity for tax fraud, i.e. the low level of complexity of the tax system, such as and high levels of equity and tax morality significantly diminish tax fraud. Alm and Torgler (2006) identify a positive correlation between fiscal morality and trust (in the legal system and parliament) as well as a negative correlation between tax morality and the value of the underground economy. Cummings, et al. (2009) concludes that intercultural differences in tax behavior are due to taxpayers' perceptions of tax administration and government quality. Wintrobe and Gërkhani (2004) or Fischer and Schneider (2009) underline the importance of confidence in the compliance process.

Conclusions

Tax behavior is related to tax obligations.

The study of fiscal behavior from an intercultural perspective has become, especially after the crisis of tax solutions, a primary need. The fact that citizens of different countries have a different tax morality and is subject to varying tax obligations or the

fact that a change in the level of confidence in the efficiency of the authorities would result in a change in compliance must be considered. These facts are not only the result of an existing geographic climate, of historical changes in the social, moral, religious architecture but also of policies and economic measures adopted, whether or not correctly, over time in the respective states, all creating a sui-generis fiscal culture. That is why it is the duty of states in difficulty not only to look at the "neighbor's yard" that has found more effective solutions, but even to knock them out, negotiate with them, and eventually ask for a "goat" loan, but in any case to wish her death, as recommended by a famous Romanian adage. In the absence of models such as the "goat of the neighbor" who managed to perform in spite of the money, time and patience crises, what chances would we ever have to find what we admire when we dare to look up a fence? We do not have to copy ad litteram tax policies, because we cannot and it is wrong to do so.

The tax culture of a state is nevertheless unique and non-transferable. Then, history has shown us that, in most of them, attempts to copy literally, for example, economic or political systems, have proved to be failures. What we can do is learn from the experience of others, borrow and then adapt. In this sense, each state must first understand its own fiscal culture, that is, the accumulation of doctrines and economic, social, political, moral, religious, geographic factors that characterize it. Once they have understood their fiscal culture, state authorities can answer questions such as:

How open are countries with a communist political regime - like China - to create synergistic climate by implementing strategies to advise new entrepreneurs?

What financial availability exists in countries such as India, Pakistan, Morocco to increase spending on preventing and combating tax fraud?

Given the low level of tax morality and credibility of authorities in countries such as Moldova, Romania, Brazil, can we talk about a transition from the antagonistic to the synergistic climate and, if so, with what costs?

How can they reduce the taxpayer's degree of monitoring and where can the tax press countries increase with high morality and trust, such as Switzerland, Sweden, Austria, Australia, so as to bring about an increase in compliance and so high?

Only by seeking such answers can a country's fiscal culture adapt, keeping traditions and borrowing new ones.

RELATION BETWEEN THE MARKET CAP AND ENTERPRISE VALUE: CASE STUDY ON THE VALUE OF LEADING STEELMAKERS

Viorica Mădălina ION (MANU)

*Bucharest University of Economic Studies
11 Tache Ionescu St., floor 1, room 8102, Bucharest, Romania
mvmadalina@yahoo.com*

Abstract. *This article is part of the author's research on the enterprise value and its determinants, in order to understand the ways to increase/ maximize it, in the context of the theory of value maximization as the single objective of a company. The purpose of the paper is to analyze the enterprise value determinants, in order to help the interested parties, make correct (investment) decisions by studying cases of mergers and acquisitions, as it was the case of ArcelorMittal (Galați). The current status quo of the Romanian steel mill, which was in difficulty before the privatization, is a company in the aftermath of a divestment decision. The research questions refer to the understanding of the relation between the enterprise value and market capitalization of the selected companies acting in the steelmaking field, including other factors (such as the ownership structure). In order to understand how the enterprise value is determined, I have analyzed relevant theories, including Tobin's Quotient (q) for a company / aggregate corporation, for the study of the relation between the market value and its replacement value. If used empirically, Tobin's q helps avoid issues of estimating shareholders' risk-adjusted required return by the market prices. Besides using the graphical visualization of the share price, I have used the datasets available for several years on the value of several mature steel producing companies, market capitalization and other indicators. The methodology also includes Market Comparable method and own spreadsheet calculations. After analyzing the evolution of the share price for the global steelmaking leader (ArcelorMittal), between 2009 and 2018, I have not identified any growth potential; the market value of ArcelorMittal is a proxy for the market value of its assets. For the target price of ArcelorMittal, the calculated odds of ArcelorMittal to move above current price is about 31.89%, based on normal probability distribution (the probability density function to fall within a particular range of prices over 60 days).*

Keywords: *enterprise value; interested parties; market capitalization; ownership; Tobin's Q Ratio.*

Introduction

On April 13, 2018, a company listed on New York Stock Exchange (ArcelorMittal, symbol MT) announced a divestment package, as part of European Commission review into its new acquisition of a plant in southern Italy. World's biggest steelmaker put up for sale six European assets (of a combined value of \$752-940 million) among which Galați mill (AMG) is the country's biggest steel plant (employing about 5,600 people now) and the largest of those assets. ArcelorMittal falls under 'Large-Cap' category, under Basic Materials sector as part of Steel Works industry.

Being under state-supervised special administration since 2015, the target company from Italy (Ilva) was followed by charges of corruption and environmental crime and is

about to be cleaned up or closed (Reuters, 2018). Such acquisitions are already a practice for many years for the owners of ArcelorMittal, as it was the case of the former state owned Romanian steel mill, Sidex Galați, which was incurring losses and bought for €70 mil. (2001), then rebranded into ArcelorMittal Galați. India's biggest steelmaker may bid for ArcelorMittal Galati plant, according to (Reuters, 2018).

The paper is a minor extension to author's previous research on the factors of enterprise value and the case of a company in difficulty that was and still is incurring losses.

Problem statement

Challenging the status quo is about asking the right questions and finding the primary obstacle to growth. The current status quo of ArcelorMittal Galați is a bad loss because of the market evolution and management; instead of making superficial changes that have an impact only for the short term, the organizations should make the changes that will allow them to increase/ maximize their value.

Stock prices are reliable and realistic for valuations. Therefore, how the company market value (stock price) changes when it announced dispose of assets of \$752-940 million?

Literature review

Investors have to know to value a business, not how much a stock has been going up or how sales of a new product are progressing, or "what is this business worth, given all the available facts?" (Mihaljevic, 2014).

Asset pricing studies the value of claims to uncertain future payments, based on: the timing and the risk of its payments (corrections for risk are much more important determinants of many assets' values). Financial claims are promises of payments at various points in the future, as for example, a stock, which is a claim on future dividends; at date t , we can define payments $x_{t+\tau}$ for $\tau \geq 1$ and expect the price of these payments to be as below, with some adjustment for time and risk. So, investing p_t today will bring $x_{t+\tau}$, in the future (Brunnermeier, 2015):

$$p_t \approx \mathbb{E}_t \sum_{\tau \geq 1} [x_{t+\tau}]$$

In terms of returns, i.e. investing 1 unit today, will bring R_{t+1} in the future (Brunnermeier, 2015):

$$R_{t+1} = x_{t+1} / p_{t+1}$$

Depending on the perspective used (market or accounting) there are several types of values used in various situations, as shown in figure 1.

value			
liquidation (floor) value (non-going -concern)	book value (BV) (accounting)	market value (MV) (fair value)	replacement cost of the firm's net assets (Tobin's q)

Figure 1. Expressing value (Source: author's representation)

Nobel Prize winning economist, Dr. James Tobin offered an alternative measure (q) to the ratios used:

$$q = MV_{\text{assets}}/RC$$

Where MV_{assets} = the market value of a firm's assets; RC = the replacement cost of these assets.

In practice, the book value (BV) of debt is used when the market value of debt (MV_{debt}) is unavailable. (Damodaran, n.d.)

However, q is not (yet) used in practice in the valuations of companies, probably because of the lack of the necessary input data. Mihaljevic (2010) acknowledged that the Q estimation method has one major drawback—it is not good at dealing with truly exceptional businesses, i.e., companies that have a large off-balance sheet intangible source of sustainable business value (like Coca-Cola, Microsoft and Walt Disney).

In contrast to the M/B (using the book value of the total assets as denominator), the Tobin's Q applies the replacement values of assets; instead of measuring the financial performance of the existing assets, the Tobin's Q measures the financial performance of a new investment, if the existing production capacity is reproduced, being oriented towards the future (Groß, 2007). When inflation pushed up the replacement cost of the assets or where technology has reduced the cost of the assets, q may provide a more updated measure of the value of the assets than the accounting book value.

Empirical studies using Tobin's q initially focused on explaining it (Lindenberg & Ross, 1981; Salinger, 1984), then predicted investment spending (Furstenberg, 1977; Summers, 1981; Hayashi, 1982). Several studies of the effects of managerial equity ownership (Morck, Shleifer & Vishny, 1988; McConnell & Servaes, 1990) have emerged or on the size of a company's board of directors (Yermack, 1996), corporate diversification (Berger & Ofek, 1995; Rajan, Servaes & Zingales, 2000) and dividend changes (Lang & Litzenberger, 1989; Denis, Denis & Sarin, 1994). Holding investment opportunities constant while investigating the determinants of capital structure (Titman & Wessels, 1988), leveraged buyouts (Opler & Titman, 1993) and takeovers (Lang, Stulz & Walkling, 1989; Servaes, 1991), studies on stock market investments at times when the Q ratio was less than parity have produced above-average long-term returns (Harney and Tower) despite other contrary opinions; "q beats all variants of the PE ratio for predicting real rates of return". (Mihaljevic, 2010)

Tobin's Q estimates (Chung & Pruitt, 1994) have been calculated using publicly available and easily verifiable company-specific accounting and market pricing data, showing that at least 96.6% of the variability of Tobin's q, as calculated more elaborately by Lindenberg and Ross (1981), is explained by the "approximate Q" (Mihaljevic, 2010):

$$\text{Tobin's } Q = (MVE + PS + DEBT) / TA$$

Where MVE = market value of the common equity of a firm; PS = liquidating value of the firm's preferred stock; DEBT = current liabilities minus current assets, plus book value of long-term debt; TA = the book value of the total assets of the firm.

Jovanovic and Rousseau (2002) extended Tobin's q theory of investment to merger waves (the q-theory hypothesis) arguing that the technology generating profitability lead to Tobin's q increase and such firms can expand profitably by acquiring other firms. The q-hypothesis permits only horizontal mergers and does not synchronize with the empirical observation of lesser merger frequency in unlisted companies (Bailey & et.al., 2015).

Smithers and Wright (2002) created equity q and made the case that in the late 1990s, the US market was extremely overvalued:

$$Q = E / NW$$

Where E=equity market cap; NW=net worth at replacement cost. (CFA Institute, 2017)

Analysts have used a market-level Tobin's q to judge whether an equity market is disvalued, by comparing the current q with 1 or the historical mean value (CFA Institute, 2017). Tobin's q calculated at an overall market level is:

$$Q = (E + D) / RC$$

Where RC = estimate of the replacement cost of aggregate corporate assets; E and D= estimates of aggregate equity and debt market values.

Company-specific Tobin's Q ratios vary to a lesser degree within industries as calculated by (Mihaljevic, 2010).

Research method

After the boom between 2002-2007 and after reaching a historical high in July 2008 (see also picture 1), the average global price of steel has declined each month since then, and in May 2009 reached a level that was 55% lower than July's peak (OECD Steel Committee, 2009). Then, the average steel prices between 2011 and 2017 (figure 1) had decreased.

**Figure 1. Steel prices evolution
(ArcelorMittal, 2018)**

Looking at the company price (picture 1) on the various stock exchanges, we can see a similar trend for the company. After the peak reached in 2008, the company share price followed the steel price evolution.

Picture 1. Company stock price history (1997- June 2018) (Source: Yahoo Finance & Morningstar, 2018)

After the drop in 2009, the company did not manage to recover and reach or beat those results, following the evolution of the price of steel. At present, the company price is slightly recovering. In the issue of 'Equities and Tobin's q', September 2010, for the ArcelorMittal (MT) price of \$32.83 (-20% low and 51% high), MV of \$49,587mn and EV of \$70,012mn, price/book was 0.9, q was 0.5, similarly to the year and quarter before (see table 1).

Table 1. Interpreting Tobin's Q (Source: CFA Institute, 2017; Mihaljevic, 2010; Damodaran, 2012)

q for the company (MT)	q value	Explanation
	q>1	It is profitable to invest in the capacity reproduction; if a company has a Q ratio meaningfully in excess of parity, the market may be pricing in sustainable long-term outperformance and investors may want to verify their assumptions about the true sustainability of a company's high returns on capital.

0.5; 0.34	$q < 1$	negative excess returns; firms do not utilize efficiently their assets; further capital investment is unprofitable; firms likely to be taken over for restructuring;

Company's present market value is the effective cost of buying the company or the theoretical price of a target company before a takeover premium is considered; rather than the equity value, EV include all ownership interests and asset claims from both debt and equity (see Table 2).

Table 2. Company's Multiples at present (Source: ADVFN, 2018; Yahoo Finance & Morningstar, 2018)

VALUATION RATIOS	In USD
Enterprise Value (EV)	42 B
Market cap	35.3 B
Current P/E Ratio - LTM	6.5
Enterprise Value (EV)/EBITDA	8.15

EV = Market Capitalization + Market Value of Debt – Cash and Equivalents
or

EV = Common Shares + Preferred Shares + Market Value of Debt + Minority Interest – Cash and Equivalents

Assets, or the application of funds are financed through liabilities and shareholder's equity as the sources of funds used.

When we say value, we mean the current or market value of the company, the market value of liabilities and the market value of equity.

Next, in table 3 are presented quarterly indicators published by the company, including EBITDA.

Table 3. Quarterly indicators (for the year 2017) (Source: ArcelorMittal, 2018)

Indicators (USDm)	1Q 17	2Q 17	3Q 17	4Q 17
Sales	8,222	9,180	9,196	9,610
Operating income / (loss)	636	652	546	525
Depreciation	273	290	302	336
EBITDA	909	942	848	861
Average steel selling price (US\$/t)	649	698	723	736

In table 4, the EBITDA improved over the last years, overcoming the level registered in 2011.

Table.4 Indicators for the European segment of the group company (2011-2017)
(Source: ArcelorMittal, 2018)

(USDm) unless otherwise shown	2011	2012	2013	2014	2015	2016	2017
Operating income / (loss)	(369)	(5,725)	(985)	737	171	1,270	2,359
Depreciation	2,153	1,944	2,003	1,510	1,192	1,184	1,201
Impairments	301	5,032	86	57	398	49	0
Restructuring / Exceptional charges	219	587	517	(0)	632	0	(0)
EBITDA	2,304	1,838	1,621	2,304	2,393	2,503	3,560

Financial data are often considered very ‘noisy’, being difficult to separate underlying trends or patterns from random and uninteresting features and not being normally distributed; high frequency data often contain additional ‘patterns’ (as a result of the way that the market works, or the way that prices are recorded) and these features need to be considered in the model-building process. (Brooks, 2014)

For statistical reasons, raw price series are converted into series of returns, which are unit-free (figure 3). The log-return formulation (or log-price relatives, since they are the log of the ratio of this period’s price to the previous period’s price) have the property that they can be interpreted as continuously compounded returns – so that the frequency of compounding of the return does not matter and thus returns across assets can more easily be compared, and are time-additive. However, the disadvantage of using the log-returns is the continuously compounded returns are not additive across a portfolio; the log of a sum is not the same as the sum of a log, since the operation of taking a log constitutes a non-linear transformation.

Figure 2. The natural logarithm of the close price of ArcelorMittal
(on Euronext, between 02.01.2007 - 01.07.2018)
Source: author's calculations

Results

When investing in/ managing assets, the key is not only to know their value but also to understand the sources of value and the ways to increase it, or at least prevent its decrease. Tobin's q and other multiples prove to be useful tools in making investments.

Tobin's q may still support improvements and developments in the theory and practice; for example, its significance can be further developed, for smaller intervals, such as q of 0.5 to indicate investment for the short term, while for the long term investment, $q < 0.5$.

Companies need to permanently consider the changes in their value and manage this process at their best. Enterprise Value is a firm valuation proxy that approximates current market value of a company, to determine takeover or merger price of a firm, unlike market capitalization, which is smaller; EV takes into account the entire liquid asset, outstanding debt, and exotic equity instruments that company has on its balance sheet. When takeover occurs, the parent company will have to assume the target company's liabilities but will take possession of all cash and cash equivalents.

Conclusion

According to (OECD Steel Committee, 2009), the global economic crisis has pushed the world steel industry into recession and steelmaking capacity continues to increase despite the market downturn.

The Romanian steel company has to understand the changes undergoing in the field and challenge its status quo of a company in difficulties; instead of making superficial changes with impact for the short term, should prepare a long-term strategy of value maximization that will allow it to thrive as it happened in the past in the communist era.

THE ROLE OF BANK'S INNOVATIVENESS IN BUILDING MARKET EFFICIENCY – THE CASE OF POLAND

Monika KLIMONTOWICZ

*University of Economics in Katowice
1 Maja 50 St., 40-287 Katowice, Poland
mklimontowicz@ue.katowice.pl*

Abstract. *New technology has already influenced almost all aspect of human life. Innovativeness is considered one of the most important requirements for both companies and employees. Even such traditional entities like banks should develop their propensity and ability to incorporate changes in business practices through the creation and adoption of new ideas, solutions, and technology. The purpose of the paper is to investigate to what extent bank's innovativeness impacts a bank's market performance. It presents banks' innovativeness and other competitive advantage factors, their assessment from the perspective of their potential in the process of building bank's competitive advantage and a correlation between the level of bank's innovativeness and market efficiency. The majority of the innovativeness research concentrate on developed countries and very little is known about developing, transition countries. Moreover, few of them explore banks as a specific entity. On the banking market, they focus rather on distribution channels or product innovations. To the best knowledge of the authors, this is the first attempt to empirically examine the relationship between a bank's innovativeness and market efficiency in a transition banking market in Europe. The paper uses data retrieved from the research survey. The survey's target group consisted of all retail banks operating in Poland defined as banks that offer a broad range of financial services to different segments of individual customers. The research was conducted under the auspices of the Polish Banks Association. The data was collected by two methods – PAPI (personal and pencil interviews) and CAWI (computer assisted web interviews). The questionnaire was applied to executive managers of retail banks operating on Polish banking market and banks' customers. The data used for assessing banks' market performance were derived from banks' annual reports. The results provide direction for banks' decision makers concerning innovativeness' factors that should be taken into account in the process of building competitive advantage and market performance.*

Keywords: *bank's innovativeness; competitive advantage; knowledge-based intangibles; financial technology; market performance*

Introduction

Financial technology is thought to be one of the most disruptive factors influencing the banking market all over the world. It is an exciting area of change and development with an unclear impact on banking products, service delivery, and banking market structure at this time (Walker, 2018). Undoubtedly, today the development of bank's market performance, competitiveness and effectiveness is strictly connected with innovativeness (Aghion, Reenen, & Zingales, 2013; Chava et al., 2013; He & Tian, 2013; Bernstein, 2015; Cornaggia et al., 2015). Banks have to be able to create systems that implement new technologies and applications, optimize processes of providing banking products and services, develop financial infrastructure and allow them to exchange

information about customers and their behavior in all distribution channels. The traditional attitude to bank's management focused on resilience and safety might not be enough to face new market challenges (Sullivan, 2009). Lowering the entry barriers and the threats of a necessity to compete with technology-oriented market players (FinTech companies) combined with changes in customers' expectations will require adjusting banks' market strategy and business models (First Data Corporation, 2010; Williams & Page, 2011; BMO Wealth Institute, 2014). All these processes make building bank's innovativeness enormously important.

The majority of the innovativeness research concentrate on developed countries and very little is known about transition countries. Moreover, the few of them explore banks as a specific entity. On the banking market, they instead focus on distribution channels or product innovations and their adoption (Nekrep, 2013; Norden, Buston & Wagner, 2014; Akhisar, Tunay & Tunay, 2015; Mullan, Bradley & Loane, 2017; Priya, Gandhi & Shaikh, 2018; Salampasis & Mention, 2018). To the best authors' knowledge, this is the first attempt to empirically examine the relationship between a bank's innovativeness and market efficiency in a transition banking market in Europe.

The purpose of the paper is to investigate the contribution of the bank's innovativeness to bank's market efficiency. Achieving the purpose of the paper requires answering the following research questions:

- RQ1: What is the importance of a particular bank's competitive advantage factors from the perspective of building market position?
- RQ2: Does a bank's innovativeness influence its market efficiency?

The paper uses a two-fold methodology. The range of assets influencing a bank's competitive advantage and market performance was prepared as a result of a literature review. Then they were verified by empirical research. The strategic assets' structure was verified using a principal axis factor analysis. Afterward, the impact of verified assets' groups on banks' performance was examined.

The remainder of this paper is structured as follows: the first section presents the literature review concerning innovativeness and other bank's competitive advantage factor, the second section considers the competition on the Polish banking market, the third section shows the empirical results and include the assessment of innovativeness importance for building bank's competitiveness and the correlation between innovative capability and market efficiency. The paper concludes with the summary evidence of the study and its limitations.

Bank's innovativeness as competitive advantage factor

Today as never before banks market environment has a crucial impact on banks' business decisions. Many factors make gaining competitive advantage more and more difficult. Among them, the most important is new technology. Its continuously increasing complexity and the development of information and communication's techniques has resulted in a social revolution that has changed customer behavior and expectations concerning banking services. The technology development has a profound effect on retail banking services all over the world. The primary motivation for using modern technology has been to reduce costs (Delafrooz, Taleghani & Taghineghad,

2013; Persson, 2013), increase efficiency, speed, and control of customer-bank interactions (Honebein & Cammarono, 2006). The contemporary motivation is to add value to the overall customer experience (Blount, 2010). In recent years, the technological landscape has been additionally enriched by social media development that has influenced markets, companies, institutions, and customers' behavior and expectations (Kaplan & Heinlein, 2010; Hanna, Rohm & Crittenden, 2011; Durkin, Mulholland & McCartan, 2015).

Obtaining a sustainable competitive advantage requires developing the bank's innovativeness. The banks' innovativeness is an organization's propensity and capability to rapidly incorporate change in business practices through creation and/or adoption of new ideas, that decrease costs, reduce risks, and improve product what results in adding value in the form of increased competitiveness and sustainability (Frame & White, 2002; Guimaraes, Brandon & Guimaraes, 2009). It is an aspect of organizational culture that reflects the internal receptivity to new idea and innovations (Hult, Hurley & Knight, 2004; Menguc & Auh, 2006; Tsai & Yang, 2013). A firm oriented toward innovation makes individuals, teams, and management more open to ideas generation, creativity and risk-taking (Zhou & Wu, 2010). Following resource-based view (RBV) bank's innovativeness is one of internal resources and capabilities that, if matched appropriately with to environmental opportunities, help organizations to gain competitive advantage. The basic assumption of RBV is that resources and capabilities are heterogeneous across firms, and the firms that have superior resources gain sustainable competitive advantage (Hamel & Prahalad, 1990; Barney, 1991; Peteraf, 1993; Acur & Bitici, 2004; Cheng et al., 2010; Zubac, Hubbard & Johnson, 2010). Innovation capability includes strategic capability, product development capability, and technological capability (Vicente, Abrantes & Teixeira, 2015). It requires adequate leadership style, efficient customer knowledge management, and proper investment in technology implementation. Thus such a capability results from the efficient management of a bank's strategic resources and concurrently influences the strategic resources (Figure 1).

The basic nature of the banking business is knowledge intensive (Mavridis, 2005). From that perspective, the most important asset category is human capital. It also influences the efficiency of market capital's usage, especially the reputation, long-term relationship with customers and their trust.

Concurrently, meeting customers' expectations regarding speed, flexibility, access to banking services and usage convenience, is impossible today without organizational capital. Additionally, during the last few decades, as a result of fast technology development, many financial innovations have been implemented and have become a source of competitive advantage.

Nowadays, banks are allowed to underwrite insurance, while other financial entities are given a possibility to offer some financial products that have been traditionally provided by retail banks (Nejad & Estelami, 2012).

Figure 1. The relations between the bank's strategic resources and innovation capability

The emerge of crowd-funding business models, and the introduction of payment services by companies originating from other sectors have contributed to the alteration of the landscape of the banking industry.

All these developments make banks to rethink their market strategy and business models basing them on the resources which are of strategic importance from the perspective of their ability to create bank's competitiveness and market performance.

The competition in the Polish banking market

The banking market plays a significant role in the Polish financial sector. Although the assets of the non-bank financial institution have been systematically growing, the dominant share of the banking sector's assets in the assets of all financial entities remain stable. During the last decade, it has been ranging between 66.7% and 73% (Figure 2).

Figure 2. The structure of the Polish financial sector's assets (NBP, 2007-2017)

Taking into account the assets' structure, the Polish market is representative for the Middle-East European financial sector (Figure 3) and for most countries in European Union where banking market is the crucial segment of the financial market. Despite Cyprus, Netherland, Ireland, Luxemburg and Malta, banks as financial intermediaries have key functions in the domestic economy.

The Polish banking market consists of commercial banks, credit institutions, and co-operative banks. The competition in all segments has appeared in the 90. last century, but the history of the banking sector is dated on the 15th century when the first banking houses were established. Despite the turbulent history and the loss of independence, the first issuing bank, called the Polish Bank, stated the activity in 1828. Some banks established at that time are still operating on the Polish banking market. Bank Handlowy, the first commercial bank in Poland, has been operating for a continuous period till now. The other banks, as PKO Bank Polski and PeKaO SA, stopped their activity during the Nazi German occupation and reestablished market activity after the Second World War. A centrally planned economy was not conducive to the development of competition and did not require customer-oriented strategy. The bank's market behavior started to change in 1989 after introducing the new Act of Banking that

enabled the establishment of non-state banks in Poland. The market response was immediate. By the end of 1992, there were 54 domestic banks. Since then the process of mergers and acquisitions has become the essential methods for gaining a more significant market share, as well as restructuring some of them. Poland's entrance to the European Union also resulted in cross-border consolidation (Klimontowicz, 2016). Mergers and acquisitions influence not only the number of banks and the sector's ownership structure but also impact the level of market concentration.

Figure 3. The structure of the Polish financial sector's assets (NBP, 2007-2017)

The most frequently used measures of banking market concentration are Herfindahl-Hirshmana index (HHI) and concentration ratio (CR5). They are also considered to be an indicator of the level of market competition. The selected market data is presented in Table 1.

Table 1. The structural characteristic of the Polish banking market (NBP, 2007-2017)

	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
Number of banks											
commercial banks	48	47	49	49	49	47	45	41	38	38	37
co-operative banks	584	581	579	576	576	574	572	571	565	561	560
credit institutions	12	14	18	18	21	21	25	28	28	27	26
Banking distribution network											
branches	3 735	4 073	4 511	6 507	6 933	7 092	7 534	7 336	7 352	7 230	7 137
subsidiaries and agencies	4 854	5 217	5 789	7 290	7 246	6 802	4 876	5 019	4 872	4 660	4 135
Number of employees (in thousands)											
	157,9	167,2	181,3	175,2	176,9	176,7	175,1	174,3	172,7	170,9	169,3
Market concentration											
HHI	0,599	0,640	0,562	0,574	0,559	0,563	0,568	0,586	0,656	0,670	0,659
CR5	46,1	46,6	44,2	44,2	43,9	44,3	45,0	46,01	48,5	48,8	48,5

The level of HHI and CR5 ratios reflect that till 2010 big banks had been developing their operating activity slower than small and medium-size banks. Since 2010 both indexes, to a small degree, but systematically, has been growing. However, in comparison with other European countries the level of market concentration is relatively low (Figure 4).

Figure 4. The concentration of the Polish banking market in 2016 (ECB)

The concentration ratio is one of the lowest in Europe and significantly lower of the European Union, the Eurozone, and the CEC-5 average. Understandably, it is higher in countries with developed co-operative banks' sector as Austria, Germany, and Italy. The low HHI index and the relatively low market share of big banks enhance the market competition. Many factors have influenced the intense competition in the Polish banking market. Today, in post-crisis reality it is quite difficult to point out the most important of them (Pawłowska, 2010). Undoubtedly, the competition occurs in the inter-bank space. The level of competition influence both banks' innovativeness and market performance (Anning-Dorson, Nyamekye & Odoo, 2017). Although banks have already noticed new market players, most of them do not treat them as crucial rivals. Whereas in many worlds markets they are thought to be the biggest threat (Worthington, 2011).

Bank's innovativeness and market performance

Bank's innovativeness is strictly connected with its strategic assets. As a category, it results from strategic capacity, product development capacity and technological capacity. The broad range of possible assets that might be the foundation for creating those capacities in the context of gaining competitive advantage and market performance led to the question what strategic assets have the crucial importance on contemporary banking market in Poland.

The list of potential strategic resources was prepared on the basis of a literature review. Then they were verified by empirical research. The research was conducted under the auspices of the Polish Banks Association. The survey's target group consisted of all retail banks operating in Poland defined as banks that offer a broad range of financial services to different segments of individual customers and fulfill all their financial needs and expectation. The questionnaire was applied to executive managers of retail banks

operating on the Polish banking market. 51 statements in the questionnaire were chosen to examine the significance of intangible and tangible assets. A seven-point Likert scale from 1 to 7 was used in the research. The importance was graded from 1 which meant that the item is not essential at all to 7 which meant the enormous influence. Reliability analysis for competitive advantage components, measured with Cronbach's alpha, ranged between 0,81 and 0,90 for each construct what confirmed adequate reliability levels for all of the scores. The assets of banks which responded to the questionnaire correspond to 79.5% assets of all retail banks operating in Poland. Two methods collected the data – PAPI (personal and pencil interviews) and CAWI (computer assisted web interviews).

The strategic assets' structure was verified using a principal axis factoring analysis with varimax rotation. The analysis resulted in the identification of four factors that correspond to strategic assets and banks' innovation capability. The pattern matrix of the empirical strategic resources' item is shown in Table 2. Only items with a factor loading at least 0.60 were considered. Factor loadings of less than 0.6 have been deleted. Four factors of presented items account for 79% of the variance, with factor 1 which explains 24% of the total variance. The verified structure of banks' strategic resources includes 38 items.

Table 2. The pattern matrix for strategic assets

Items	Factor 1	Factor 2	Factor 3	Factor 4
The level and efficiency of assets			0.77	
The level and efficiency of equity			0.89	
The sources of funding			0.94	
Net profit			0.87	
Liquidity/			0.82	
The quality of financial management			0.80	
The level of service modernity	0.89			
The implementation of innovative products	0.78			
The implementation of innovative procedures	0.80			
Using technology in the bank's management	0.79			
The quality of leadership		0.88		
The number of employees	0.66			
Educational level of employees				0.63
Professionalism				
The employees' identification with the bank's objectives				0.88
The level of knowledge regarding a bank and its offer				
Customer-oriented attitude				0.78
The ability to develop long-term relations with clients				0.77
The willingness to self-development				0.75
The level of employees' innovativeness				0.68
The will to cooperation and knowledge sharing		0.76		
The quality of executive management		0.94		
The quality of mid-level management		0.97		
The level of managers' acceptance		0.95		

Items	Factor 1	Factor 2	Factor 3	Factor 4
The quality of the motivation system		0.84		
The number of branches	0.60			
The number of ATMs	0.77			
The branches' organization and working hours				0.88
Employees' equipment		0.73		
Internal IT systems and procedures				
The level of quality management				
The effectiveness of procedures		0.69		
User-friendly procedures		0.68		
Efficiency and timeliness of services	0.78			
The usage of traditional distribution channels	0.93			
The usage of modern distribution channels	0.91			
The safe and comfortable way of transactions' authorization	0.89			
The effectiveness of internal control				
The knowledge of clients' needs		0.74		
Matching products to clients' needs				
The ability to develop long-term relations with customers				0.65
Interesting proposals for customers				
The understanding of competitors			0.78	
Brand value			0.73	
Branches' appearance				0.68
% of explained variance	24	22	18	16
Cumulative % of explained variance	24	46	63	79

The first factor has loadings from all the items related to the bank's product development capacity and includes items allowing a bank to serve the right products in the right place and at the right time. It incorporates the factors influencing both the product (service) and the process innovations.

The second factor represents the strategic capability based on human assets. It is worth to stress that the most significant factors are connected with the quality of leadership and management. These and other items influence the organizational culture and employees' work conditions.

All the analyzed items representing financial aspects of banks' market activity had noticeably high loadings on the third factor. From the perspective of the bank's innovativeness, they are the source of financing the process of creating and implementing the innovations.

The analysis of the last factor items leads to the conclusion that most of them impact banks' ability to create long-term relations with customers.

Reliability test on the factor groupings confirms achieved good results.

Due to a particular role in the economy banks' market activity is influenced by many factors of a political, legal, economic, sociological, and technological nature. To examine

the relationships between competitive advantage factors and banks' financial efficiency a multivariate regression analysis was conducted. ROE and ROA measured the bank's market efficiency. The data used for assessing banks' market performance were derived from banks' annual reports. Before conducting a multivariate regression analysis, the correlation between independent and dependent variables, and test of multicollinearity using the VIF (variance inflation factor) was conducted.

The following equations show regression models:

Model 1: $ROE = \beta_0 + \beta_1 (\text{Factor 1}) + \beta_2 (\text{Factor 2}) + \beta_3 (\text{Factor 3}) + \beta_4 (\text{Factor 4}) + e$

Model 2: $ROA = \beta_0 + \beta_1 (\text{Factor 1}) + \beta_2 (\text{Factor 2}) + \beta_3 (\text{Factor 3}) + \beta_4 (\text{Factor 4}) + e$

Models were estimated for ROE and ROA from 2012 till 2016. Table 3 presents the regression results only for 2013 as any significant positive relation has been observed in the subsequent years.

Table 3. Regression results

	Model 1	Model 2
Intercept	10,940*** (10,30580)	1,112 (5,236)
Factor 1	0,493 (0,443)	-0,026 (-0,117)
Factor 2	2,938** (2,639)	0,346 (1,553)
Factor 3	3,684** (3,309)	-0,230 (-1,034)
Factor 4	1,381 (1,241)	0,329 (1,477)
Adjusted. R ²	0,610	0,143
F-value	4,914	1,420
Significance	0,0421	0,333

Notes: ***, **, and * denote statistical significance at the 1, 5, and 10 percent levels respectively. The figures in the parentheses are the t-statistics.

The results of the regression analysis show that there was a significant positive correlation between strategic capability based on human assets and financial assets of the banks operating in the Polish banking market and their efficiency measured by ROE. Concurrently, there is no a significant correlation between any factor category and the efficiency of assets' management measured by ROA.

Discussion and conclusions

During the last few decades, the Polish banking market has changed remarkably. Opening the market for foreign investors has increased the number of bank and credit institutions. The assets of the Polish banking market have been systematically growing and has become one of the most competitive markets in Europe. Although the new market player has already entered the banking market, banks remain the most crucial market player with over 70% of market assets share. Such a situation corresponds to other banking markets in Europe. The market condition has made banks to search for factors enabling them gaining competitive advantage.

The factors analysis proved that in contemporary economy banks should base building competitive advantage on those strategic resources that are strictly connected with their innovation capability. Among them, the most important are those that allow a bank to improve products, services, and processes. The findings are relevant to Shih (2008) who recognized the importance of innovations and IT. They correspond with some previous research conducted on the banking market and others markets that showed the dominance of human capital (Blazevic & Lievens, 2004; Jong & Hartog, 2007; Curado, 2008; Liao et al., 2017; Waheed, Kabiru & Umair, 2018) and the impact of strategic management on the ability to create long-term relationship with customers and value creation (Kianto, Andreeva & Pavlov, 2013).

The regression analysis proved the importance of human assets for the bank's efficiency of equity management. The second factor that impacts the bank's efficiency includes financial parameters as the level of equity, the level of assets, profits and liquidity. The results gave no evidence for a direct correlation between any of competitive advantage factors and the efficiency of asset management. They correspond to the research conducted by Nekrep (2013) that did not prove the influence of a bank's internal innovation capability on their market performance.

The results provide that building innovation capability is strictly connected with organizational culture and require specific leadership encouraging employees to be creative and motivated to create long-term relations with customers. Concurrently, the findings indirectly proved the complex character of factors influencing banks' market performance and show that it is difficult to extract particular factors influencing banks' market efficiency. It may be an inspiration for further research aimed to build a model taking into account more both external and internal factors influencing banks' market efficiency and performance.

The practical implication of the finding is the recommendation for banks' decision makers to base their market strategies only on factors that help to gain a long-term competitive advantage, market performance and efficiency. As those factors are related to fulfilling customers' needs and expectations, such a market attitude will also be beneficial for society.

As many factors influence the bank market performance, the scope of the research might be its limitation. Although the Polish banking market is one of the most competitive and stable banking markets in Europe, the results cannot be directly extrapolated to other banking markets.

Abstract. *The economic situation of the various countries has been an important subject for anyone but especially for economists. Nowadays, economic phenomena are carried out in a very rapid and profound manner, evolution taking into account various factors such as social, political, cultural, and last but not least, those in the field of information technology and technology. Thus, when the first signs of the current crisis began to be observed, the whole world was alert in only a few hours. In the opinion of economists and monetary, financial crises appear as a manifestation of banking crises, with an impact on financial stability and collapse of financial infrastructure in the absence of central bank intervention. The economic crisis that hit the world economy in the summer of 2007 is unprecedented in the post-war economic history. Although the current crisis has many features in common with past similar recession episodes. The crisis has been preoccupied with a long period of rapid credit growth, low risk premiums, abundance of liquidity, a strong leverage, rising asset prices and bubble development in the real estate sector. Economic activity is characterized by cyclicity, with periods of decline being a normal component of an economic cycle. Crises are not a new phenomenon, but over the last 100 years, due to the acceleration of the pace of economic development and the enormous advances in technology and communications, the frequency of such phenomena has increased. Such happenings have taken place in the past (e.g. in Japan and the Nordic countries in the early 1990s, the Asian crisis in the late 1990s). However, this time is different. The current crises are global and resemble the events that led to the Great Depression of the 1930s. But only two crises remain in history due to the size of the negative impact on people's lives and the international economic system: the 1929 Great Depression and the 2008-2010 Real Estate Crisis. Although there have been more than eighty years between the two, many similarities in origin, causes and propagation can be identified. The most recent one has taken on a much stronger character, because it is now too little time since its start and the effects cannot be fully analyzed. In addition, due to technological changes and recent financial innovations, the effects were much stronger and major interventions were needed to control them. To date, the most important effect is the bankruptcy of some banking and credit institutions in the United States and the European Union, as a consequence of defaulting, especially in the real estate sector, and the recovery of claims.*

Keywords: *crisis; banks; cyclicity; risk.*

Introduction

The increasing connection of the Romanian economy to the international, real and capital economic flows favored the recent catching-up process, evolved in the growth rates of 2000-2008. But an emerging economy, still marked by structural rigidities, open to the external market, can be deeply affected by such unfavorable economic conditions. As we can see, the spread of the economic and financial crisis in the United States and the UK has also hit the Romanian economy, which, from a 7.9% increase in real GDP in 2008 (true, artificial), is seeing a reduction meaning rhythm, and it is possible to reach even a negative rate in the years to come.

The analysis of the effects on our economy targets several plans: the evolution of the volume of production, orders in industry, the labor market situation and the evolution of unemployment, as well as the analysis of the investment rate in the economy. The data underlying this analysis are provided by the NBR through the March 2009 Contingency Report.

In Romania, the conjectural oscillations in the evolution of the volume of production in industry and construction are present even in the period before September-October 2008. However, after October - January, there was a decrease in production in these fields, the industrial one being the most affected (Berca, 2010).

The forecasts contained in the National Bank of Romania Context Bulletin illustrate a rebound in the growth rate of production since March. In the industrial sector, the revival is generated by the automotive industry (whose domestic demand is supplemented by an increase in external demand, especially in the German market). A positive development is also expected from the construction materials and oil processing industry. The metallurgical and related industries (metallic constructions etc.), which faced a reduction in production and orders in four to five months, seem to interrupt the negative trend and have a slight increase over the next period. Industrial branches such as textiles, footwear, clothing, leather will continue to decline in production volume, being directly influenced by the decline in aggregate demand (especially end-user goods) and in revenue cuts (Armeanu, 2005).

Developments in European countries during economic crisis

The World Bank estimates on the impact of the economic crisis, which began in 2008, predicted the largest decline in GDP for the European area. In developed economies, this period brought the first decreases in key macroeconomic indicators after years of consecutive increases. Emerging economies in Europe have been hit harder by the sudden halt in foreign capital inflows and the lack of adequate monetary and fiscal policies.

The latest crisis began in the United States by breaking the "bubble" of the property sector. The structure of the financial system has made it possible to spread the effects globally. To make the most of the leverage available, financial and banking institutions had to reduce their credit risk. Thus, these institutions have recourse to the

development of packages involving several instruments with different risks, the calculation of a risk per package and their sale to third-party financial institutions.

Such packages also included many unprofitable assets or very high risks. If the ultimate consumer becomes incapacitated, responsibility lies with the financial institution that bought the package and not with the issuing bank.

Thus, dangerous banking assets have become the property of international banks, including European banks. When more and more people became incapacitated in the US, European banks were also drawn into this dangerous liquidity mechanism. Many banks were overexposed due to bad loans.

The main result of the crisis from this point of view was the increase in risk aversion to these banks, which led to a major contraction of loans with negative effects on the real economy.

Emerging economies in Central and Eastern Europe have been heavily affected by this credit shake because both investors and financial institutions, in the desire to protect their financial resources, have resorted to measures such as:

- blocking investment projects
- tightening credit conditions
- stopping activities
- Withdrawal from certain countries
- reversing capital flows (from the emerging country to the mother country)

Investment stagnation has destabilized these economies, whose system is largely based on foreign capital contributions.

One of the effects of these measures is to increase the degree of regulation in the financial and banking sector. This measure comes after a long period of relaxation of fiscal policies, which has contributed to the spread of the crisis.

Many prestigious economists have expressed their dissatisfaction with the market deregulation movements before the financial crisis. Nouriel Roubini, in his book *Crisis Economics*, explains in detail how these movements for market deregulation have contributed to the 2008-2009 disaster. In its view, the unprecedented diversification of financial instruments, made possible by the fall in the regulation of the financial and stock market, fueled the risk appetite of investors and hid the risks to which certain financial assets were subject. The specific risks of certain assets were concealed by grouping these tools into packages and offering the possibility to buy such packages with very few additional guarantees. Thus, investors added to their portfolios and traded many so-called "toxic assets" on stock exchanges. The financial crisis that started in 2008 has highlighted these issues and has severely destabilized the financial markets. European financial institutions have played an important role in distributing and securing toxic assets. This is one of the reasons why the crisis has been felt more strongly in Europe than in other areas. Many European banks held a large volume of toxic assets. At the same time, these institutions also represented important sources of financial resources for emerging economies, such as Romania. In order to recover from the effects of toxic assets, banks were forced to use important financial resources, reducing their exposure to other markets.

Major European banks were more exposed than US ones due to the use of larger levers. They offset the risks associated with large leverage by holding less risky assets and securing them. The size of banks transforms them into dangers for the economic system, which is why the government is obliged to keep them from failure (which would affect the country's macroeconomic situation much more strongly). Thus, the exercise of the role of a last resort creditor has become a tool used extensively during this period. If the role of the US in the US lies with the Federal Bank, there is no such institution in the European Union. The European Central Bank is not authorized to do so. Under these circumstances, national governments intervened to save banks in countries such as Belgium, Germany, Iceland, and the United Kingdom.

In emerging countries, foreign capital dependence strongly affected their ability to relaunch the growth process. When capital markets jammed, by the end of 2008, these economies had no reserves to which they could call for continued economic growth.

The fall in domestic economies was only one of the factors that led to the disastrous results in these countries. Other important factors were:

- the share of non-performing loans in bank assets, which in some cases exceeded 25%.
- similar to the US real estate bubble existed in these economies.

The result was the narrowing of the main indicators of economic growth, together with worsening indicators of living standards.

Global trade has also experienced a sharp contraction, including in the developed countries of the European Community whose export structure is heavily diversified. Decreasing consumption affects production and, indirectly, unemployment. Decreasing consumption leads to a general reduction in demand for most product categories. For this reason, companies are forced to reduce their production and make redundancies or other similar measures to reduce their spending. If before the crisis of dependence on external financial resources brought advantages to the countries, it has now turned into an important risk.

Although the effects of the shock were generally lower in the European Union than in the US, the fall in GDP is similar. Prior to the crisis, the annual GDP growth of the European Community was 3.2%. In 2008, this figure dropped by half. For 2009, Europe's most drastic decline was registered by Finland (- 7.8%) and Slovenia (-7.8%) followed by Ireland.

For the same period, the unemployment rate reaches the highest in Spain, 18%, followed by Ireland and Slovenia by 11%.

Another reason why the impact of the crisis was so strong in Europe is the low savings rates of the population. Basically, this was largely based on credit for consumer growth, with the saving rate being negative for the most affected countries:

Figure 1. Population saving rate

(Source: Arestis, An assessment of the Global Impact of the financial Crisis, 2011)

However, the situation is not as dramatic as in the US, especially due to European policies on:

- less involvement of European banks in the creation of new financial instruments that include both promotional and hide actions
- less expansive monetary policy
- the low value of the external deficit calculated on the whole European block

Although the European economic system as a whole has been saved by measures taken at EU and national level, the economic crisis has revealed the many existing weaknesses. One of the most important is the lack of anti-cyclical policies and control measures that can be implemented in case of destabilization of the financial market.

The impact of the crisis on the evolution of FDIs in the European Union

Between 2005 and 2010, the total value of intra-European trade increased by 19.1%. In 2010, trade in services in the EU-27 accounted for 56.1% of total exports and 58.4% of imports. Most foreign direct investment made by EU Member States was directed to 56% of other EU Member States.

In terms of value, commodity trade has gradually increased since 2005 and total exports have increased by about 18.9%. Since 2009, as a result of the crisis, trade in goods and services has fallen by 19.1% for goods and 9% for services. The increase has resumed since 2010 with higher values than previously recorded. Data published by Eurostat presents the situation as follows:

It can be noticed that the most drastic decrease was recorded in the FDIs at the inter-European level. For 2009, values of up to 60% are lower for this indicator. 2010 saw a return of all indicators to values similar to those in 2007. Statistical data is presented for the EU-27 as a whole, but the situation in each country is different.

Most FDI flows in the EU Member States are heading for other states in the Union. Luxembourg, France and Germany made the largest contributions to intra-European FDIs in 2010.

Figure 2. Development of imports, exports and FDI between 2005 and 2010
(Source: Eurostat External Trade Report, No 3/2012)

In the foreign direct investment sector, the economic crisis had a major impact, resulting in a sharp drop in the volume invested. The rapid resumption of investment is largely due to the encouragement policies adopted by the institutions as well as to the growing need for firms to remain competitive on the international market. A side effect of the economic crisis was the need to reduce costs from multinational firms. One of the methods used was the relocation of production capacity to EU regions with lower costs, especially for labor. The effects are multiple. On the one hand, moving production to another country involves investment in that country, which has led to an overall increase in the volume of FDI. On the other hand, products made in less developed countries are exported, as evidenced by increased trade between EU countries.

The evolution of the production volume

However, the resumption of the demand for building materials should not be attributed to the development of new real estate projects, but rather to the need to continue and complete the already contracted works (Popescu, 2007). In fact, the strong reduction in demand for housing due to the cessation of lending and, on the other hand, to expectations of price reductions will very likely lead to a stagnation or even reduction of entrepreneurial interest in this medium-term domain. The optimistic expectations for the resumption of production are supported by another specific indicator such as the degree of utilization of production capacities in industry. It rises from 67% in February 2009 to 73% in March, indicating a relative revival of production.

Estimates on the use of production capacities

It should be noted, however, that in the context of the crisis, an asymmetric evolution of the analyzed branches is observed. This leads inevitably to a restructuring of the economy, to a repayment of the contribution of various branches to GDP. It remains to be seen whether the economic policies to be implemented in the next period will contribute to this structural adjustment process or will rather seek to "rescue" the sectors most affected by the crisis. Improvement of the economic outlook can also be corroborated by the positive trend of orders in these industries, whose production has a growing trend (the automotive industry, construction materials, oil production and derivatives).

The evolution of orders in industry and construction

In contrast, orders in the construction sector are slightly negative (the short term balance illustrated by the National Bank of Romania Draft March 2009 Bulletin is close to zero). Private entrepreneurs in the textiles, clothing, footwear, leather goods, transport services, energy infrastructure have reduced their production due to reduced demand for specific goods (both domestic and foreign).

Labor Market - According to the records of ANOFM, the number of redundancies increased in September-November 2008 by about one third compared to the same period of the previous year (with a maximum of 16.8 thousand people reached in November). The most frequent announcements to close down production capacities came from the industrial sector and especially from export-oriented branches (as a result of external demand contracting). These include: the petrochemical industry, metallurgy and metallic constructions, means of road transport and automotive components, machinery, electrical equipment and apparatus. Given the relatively high degree of specialization of these industrial segments, the re-employment or retraining of the redundant is difficult, which accentuates the size of cyclical unemployment.

The evolution of the labor force and unemployment rate

Unemployment rose by 0.1 percentage points from September to November, rising to 4.4% in January and 4.9% in January respectively. The deterioration of the labor market conditions is obvious and the forecasts also anticipate adjustments of the hired personnel in the following period. Also a factor that is meant to amplify the unemployment dimension in the coming period is the flow of labor migration back to other European countries, generated by worsening employment and social conditions in recipient countries.

The general tendency on the labor market is to reduce employment and, implicitly, to increase unemployment (in particular, cyclical) (Totir & Dragotă, 2011). A worsening of the employment situation will be felt in industry, especially in those branches that are forced to reduce their production of goods and services. There are, however, industries that, due to relative revival, have slowed the pace of layoffs.

In terms of wage growth, 2009 starts with a reversal of the trend. In September 2008, the gross average earnings were set at 1751 lei, increasing constantly until December to 2023 lei. The percentage increase reported in December / September is almost 16%. In January, however, there is a reduction in the salary of approx. 10% over the previous month, reaching an absolute level of 1839 lei. The explanations of a relatively late adjustment of wages in relation to economic activity should take into account the existence of rigidities of nominal wages (even in the private environment), keeping the contractual terms on wages that were negotiated at the beginning of 2008.

Analysis of labor market developments allows important conclusions to be drawn. The first shows a worsening of the unemployment situation in the economy, even if the unemployment rate is around what economic theory called natural rate. The second concerns the increasing pressure on the social security budget as a result of the increase in the volume of transfer payments (unemployment aid, etc.) committed from the budget (Mărginean, Stanef & Crețu, 2011). Or, given the existence of an already large

budget deficit, there is a need for a rethink of economic policies in the field. A third conclusion shows that the evolution of wage earnings, especially from the private sector, correlates with the economic situation and the expectations regarding future developments. We cannot say the same thing about the public sector. Except for certain staff reductions invoked by the government (or, rather, the freezing of vacancies in the flowcharts of central and local) blocking certain bonuses they were not taken real reform so as to achieve a reduction the weight and role of the state in the economy.

The level of investments (gross capital formation) registered a pronounced negative evolution starting with September 2008, the month in which the signs of the global crisis have become more and more acutely felt in the Romanian economy.

Estimates of investments

During this period, it can be noticed that the reduction of investments in construction will continue in the next period. A similar development will also be recorded in the manufacturing industries, electrical and electronic equipment. The downward trend will be present mainly in industries such as metallurgy, metal, construction, chemical, and energy transport, methane gas.

Inflation rate - The annual inflation rate has a downward trend, but remains at levels above the variation range.

Inflationary pressures remain strong - mainly as a result of rising food prices and lax wage policies adopted by politicians in the run-up to elections. In the second quarter, Romania ranks first among the 27 EU Member States, with a growth rate of 9.3% rate projected for 2008 - 9.1%).

In 2008, the current account deficit (main vulnerability) increased significantly; it is forecast that by the end of the year it will reach 18.6 mild. EURO (13.4% of GDP).

In the first 8 months of 2009, Romania attracted foreign direct investment of 6.5m. EURO; they will likely reach 8-10 mild. EURO at the end of the year (Păun, 2010).

Conclusions

The banking system is particularly complex because of the multiple ways in which it acts on the overall economic system. The main role of banks is to attract financial resources in the form of deposits and to capitalize them in order to obtain profit.

At the level of activities, however, there is a strong diversification of the operations executed by banks (Mărginean & Orăștean, 2011). Diversifying the work of these institutions changes how they affect the economic system as a whole. The latest economic crisis highlights this. Due to the large number of financial instruments and the increasing complexity of transactions between the various financial institutions, major system failures have prompted the international crisis to spread the crisis.

Romania was less directly affected by these factors because the domestic banking system still relies heavily on traditional financial instruments. The lack of so-called toxic assets has diminished the contagion effect on Romania (Mărginean, 2011). However, the

country has been indirectly affected by the overall fall in international consumption and foreign direct investment. These two factors led to a strong economic contraction in 2009-2010. 2011 marked the beginning of a stabilization period, with the main economic growth indicators reporting its upward trend. Favorable outcomes have been achieved through sustained efforts by the authorities and the NBR to manage fiscal and monetary policy. The main threat currently present for Romania is the cessation of the economic growth process. This can happen either due to the misalignment of control over the economic system or due to the decrease in international consumption (Băcescu, 2004).

For the other countries in the European Union, the impact of the crisis has been strongly felt due to the links between European and American banks. The share of toxic assets and bad loans in the portfolio of these banks has led to important problems and, in many cases, to the need for state intervention as a last resort creditor. Each state has implemented its own anti-crisis package and, although there has been a correlation at European level, the results are very different in the case of national economies (Aglietta, 2001).

For the whole of the European Union, the crisis has revealed some errors in the international financial system and has destabilized the classic conceptions that some institutions are too big to fail. The dependence of the European economic sector on the functioning of the financial and banking system has led national governments to intervene in order to avoid stronger adverse effects in the future.

Economic cycling is a known and proven phenomenon on many occasions. The lack of a set of anti-cyclical measures that can be implemented in similar situations is a major weakness of the European economic system.

One of the most important factors in the propagation of the crisis was the circulation of banking assets between institutions. The possibility of reselling risky assets as part of low-risk packages is a relatively recent practice, which has been favored by some leaks in the US and European regulatory system. At present a considerable effort is being made to strengthen control over financial institutions, but their increasing negotiating power could lead to similar effects in the future.

The 2008-2010 crisis is not the first of its kind in the last century. There have been many similar periods in recent history, but the seriousness of the current situation is largely due to the increase in trading speed and the diversification of financial instruments. In the future, none of these intensifying factors will disappear and will not diminish its importance. For this reason, it is all the more important to exercise good control over the system while avoiding choking it. Finding this balance is one of the greatest challenges of the present century (Haralambie, 2011).

ROMANIANS' TAX COMPLIANCE IN A COMPARATIVE PERSPECTIVE

Arpad TODOR

National University of Political Studies and Public Administration
30A Expoziției Blvd., Sector 1, 012104 Bucharest, Romania
todor.arpad@politice.ro

Abstract. *Using a comparative database generated through an experimental study on tax compliance and policy preferences ran in five countries (Romania, the US, the UK, Italy, and Sweden), I will evaluate the extent to which the Romanian young people exhibit higher or lower levels of tax compliance when compared with young people from other countries. The historical analysis traces the historical roots of systemic tax avoidance in Romania, while the analysis tests the explanatory power of the theoretical approaches on the causal factors that shape tax compliance can be divided into structural level and individual level theories. The two main streams of structural level theories focus either on culturalist or institutionalist factors. The individual level models, on the other hand, are the economic models of deterrence and the socio-psychological theories of tax morale.*

Keywords: *tax compliance; trust; tax morale; Romania; experiment.*

Introduction

This article represents an attempt to understand the extent to which the historical inheritance of tax avoidance in Romania influences the contemporary youngsters, when compared with similar generations from other countries. The article is structured as follows: first, I review the main important theoretical approaches on tax compliance, and discuss their implications. Second, I review some historical milestones that have influenced the level of tax compliance in Romania. Third, using a multivariate analysis, I analyze the extent to which Romania's Millennial generation is still influenced by Romania's past, or resembles more the same generations from more developed countries.

Literature review

The efforts to describe the causal factors that shape tax compliance can be divided into structural and individual level models. The main streams of structural level theories focus either on culturalist or institutional factors. The individual level models, on the other hand, are the economic models of deterrence and the socio-psychological models of tax morale.

One of the most influential structural level approaches to tax compliance, and too many other social phenomena as well, the cultural approach to tax compliance emphasizes norms and values, with a special focus on the meaning of social morality. While in northern European countries social, impersonal, autonomy-based norms are arguably dominant, southern or Latin American countries are argued to have more family-based norms. (Banfield, 1967; Tabellini, 2010; Torgler, 2002) One of the most important implication is that countries like Romania and Italy should exhibit lower level of tax compliance, since they manifest more collectivistic norms.

The other important structural level approach, the institutional trust approach, stresses that people's perceived legitimacy of the state leads to tax compliance and respect for the rules. From Levi's quasi-voluntary compliance argument (Levi, 1989) and Steinmo's analysis of differences in tax systems, (Steinmo, 1996) more recent studies that look at the attitudes towards the welfare state (Edlund & Lindh, 2013) as explanations for tax compliance and institutional trust in general. (Mishler & Rose, 2001; Uslaner & Bădescu, 2004)

The individual explanations of tax compliance based on the deterrence-based model initially advanced by Becker (Becker, 1968), Allingham and Sadmo (Allingham & Agnar, 1972) have developed a various models on the assumption of fully rational utility-maximizer individuals that can adequately evaluate the parameters of the tax game (e.g. the tax rate, penalties and detection risk). In these models, tax compliance depends on people evaluation of the risk of being caught. Instead, the tax morale approach to tax compliance is developed in the work of Schmolders (1959) on tax mentality, or Strumpel¹, and hypothesing that the higher the belief in the importance of paying taxes, the higher tax compliance should be. (Torgler, 2002) A recent study by Todor (2018) on the history of tax compliance in Romania voiced that the presence of high tax morale combined with widespread tax evasion implies that tax compliance cannot be improved sensibly through deterrence mechanisms. This is caused by the fact that a less-than-perfect institutional setting easily transforms deterrence into discretionary power that encourages corruption.

Historical milestones in structuring Romanian's attitude towards taxation

To start with, the territory of contemporary Romania has been organized throughout history mostly in three different kingdoms: Moldavia, Wallachia and Transylvania (the fourth province, Dobrogea, was part of Ottoman Empire after 1420 until 1878). One of the most important national collective identity projections is that these kingdoms were generally ruled by peace-loving kings who had to protect their lands from various plundering migratory people like Huns, Tatars, and Turks.²³ As in many other medieval states, the nobleman were exempted from paying taxes until very late, for example, in Moldavia until 1636 the noblemen in the province of Moldavia did not pay taxes. The recentralization (decreasing the latitude of noblemen to impose freely taxes on their feuds) of tax system started very late, when in 1740 Constantin Mavrocordat introduced one of the first comprehensive reforms of the taxation system, simplifying it. In Transylvania, during the medieval period most of state's income came from monetary operation, taxes, and income provided by mines and the salt mines. Each household had to pay an annual tax. The servant peasants had their own tax duties towards the noblemen's, but these contributions were more regulated than in Moldavia and Wallachia. While all the three kingdoms have paid tribute towards the Ottoman Empire for most of the period, the overall burden was lower generally in Transylvania compared with Moldavia and Wallachia. The importance of tribute and the presence of an

¹ 1969

² Hiding money from various migratory populations during their invasions was very important

³ Marian Vasile, "Evaziunea Fiscală ca Fenomen Monetar Negativ," (Tax evasion as negative monetary phenomenon) An. Inst. de Ist. „G. Bariț” Din Cluj-Napoca, Seria Humanistică, Tom II (n.d.): 1.

impoverishing tax system designed also to extract money for paying the tribute is a constant feature of portraying this period on most history textbooks.

One of the historical periods that tends to be portrayed in the most negative terms and had a long impact on how the population related to the state institutions is the Phanariot period that lasted between 1711 and 1821 in Wallachia and Moldavia. The most peculiar feature of this period was that a family would buy the right to rule in one of the provinces for a period of 7 years. Given the high amount they had to pay for their position, the rulers had a large room of maneuver to discretionary impose taxes, to alter their level and to sell virtually any position in the State apparatus in order to recover their investments. Those that bought those positions would perpetuate a similar behavior aiming to collect money to cover their investment. While in the first part 1711-1700 the ruling families were of Romanian origin that were Graecized (Hellenized), between 1770 – 1821 period, the ruling families were of Greek origins.⁴ Especially the second period portrayed the transformation of the state system in an apparatus design exclusively as spoiling the resources of the locals for the benefit of foreign elite that had no interest in developing the provinces. Thus, tax evasion became a virtue as the legitimacy of the state apparatus was totally absent.

Given the continuously decreasing influence of the Ottoman Empire and the rise of Russian Empire, after the 1821 Revolution, the Phanariot regime was abolished. While Romanian rules were reinstalled, their influence was rather limited since Wallachia and Moldavia came more and more under the Russian influence. Subsequently, in 1831 Wallachia and in 1832 Moldavia, under the direct influence of the Russian Imperial Authorities, the first set of proto-constitutional regulations (*Regulamentele organice*) were promulgated. Subsequently, in 1856 Wallachia and Moldavia unified under the same rule Alexandru Ioan Cuza and after 1866 the political elite installed a foreign ruler, Carol I de Hohenzollern-Sigmaringen, who became king in 1881 after Romania gained its independence. It is worth mentioning that in most history books the references to the prevailing tax systems during this period are only minimal.

The most notable institution evolution that indirectly affected the tax system is the evolution of land property by the Church. Since the medieval period, the only institution that kept its tax privileges was the Orthodox Church (under Romanian or Greek influence). Through constant donations received over several hundred years, by 1863 the Church owned approximately 25% of the land of the Romania⁵. Thus, in 1863, Cuza proposed to the Parliament, which accepted with 93 to 3, the full confiscation of all land properties of the Church, confiscation that lead to a significant surge in state revenues. This process led to the semi-elimination of foreign influences (especially Greek monasteries held important land properties) and consolidation of the national Orthodox Church.

The official preoccupation with the level of tax compliance started very late, the first law that explicitly forecasted measures against fiscal evasion was introduced only in 1921 followed by an easing in 1923 when the minimal tax obligations and some penalties

4 Anca Dulcinatu, *Trasaturi generale ale regimului turco-fanariot in Principatele Romane: Tara Romaneasca si Moldova* [General traits of Turkish - Phanariot regime in Romanian Principalities, Tara Romaneasca and Moldavia] n.d., 2, <https://www.academia.edu/5274436>.

5 http://www.historia.ro/exclusiv_web/general/articol/cum-l-sat-cuza-vod-biserica-n-sap-lemn

were eliminated. Under the leadership of the Minister of Finance, Nicolae Titulescu, the 1921 law introduced a progressive tax on the declared global income, and defined a luxury tax and a global business turnover. The 1923 law created significant loopholes (one of the most important forecasts referred to the possibility to over value the total value of buildings, etc.), that led to an uneven distribution of the fiscal burden⁶ and generated some significant negative effects on the direct tax income. Thus, the 1929 Law for repression against fiscal evasion on direct contribution⁷ represented the first Fiscal Code with detailed instruction for fighting tax evasion. (Virjan, 2011, p. 7) The 1929 law imposed more minimal fix contribution based on presumption and external evaluation. Also, for the first time, the attempt to bribe a fiscal public employee became punishable by imprisonment. Subsequently, a new law elaborated in 1933, the Law regarding direct contribution introduced penalties, fiscal offence and fiscal evasion. After World War Two, the Law no. 344 from December 29, 1947 introduced some harsh penalties against tax evasion but also introduced the possibility to pay previously avoided tax in order to avoid prison. While during the communist period the possibility of tax evasion was relatively limited since most direct taxes were withheld at the source, and most economic assets were state owned, the culture of informality and various networks design to access limited resources have nurtured a culture of corruption and rule avoidance. (Uslaner & Bădescu, 2004) Overall, despite the significant changes experienced by Romania in the post-communist period, the level of tax avoidance have remained relatively significant by today. (Todor, 2018) One of the expectation based on this situation is that Romanian's should exhibit lower levels of tax compliance when compared with people from other developed countries, where the overall level of tax compliance is also higher.

Methods and experimental protocol

In this section I will briefly present the main characteristics of the experimental design through which the data for the comparative study has been obtained. The experimental protocol is described in detail in (Pampel, Andrighetto, & Steinmo, 2017; Zhang, Andrighetto, Ottone, Ponzano, & Steinmo, 2016), and thus I will only briefly present the main characteristics of the activity. The subjects were recruited through public announcements and selected using ORSEE software (Greiner, 2015) with similar procedures in all locations. The experiment was run in two to four different locations in different universities that had adequate physical infrastructure for the experiments in each country. In practice, most participants were undergraduate students, and some recent graduates. The instructions were read by native speakers, and the experimental protocol was translated in each language and doubly verified.

After their arrival, participants were randomly assigned an anonymous ID, were directed towards a computer station and were asked not to talk to the other participants until the end of the experimental session. The first three stages started with a five-minute clerical task consisting of copying information from a sheet onto a table. Based on their proficiency in executing the task, each participant earned a number of Experimental Currency Units (ECUs). Each participant had to transmit their earnings after the clerical task with the formula "report your income for tax purposes" under six different institutional scenarios. Each participant was informed during the instruction

⁶ There was no property tax on the buildings owned by economic entities.

⁷ "Legea pentru represiunea evaziunii fiscale la contribuțiile directe" (Law for repressing the tax evasion to direct contributions)

that there was a 5 per cent audit probability, an audit that would fine them double the amount of money they under-reported. Whether a participant was audited was revealed only at the end of all stages in order to avoid any effect of the audit from one round to the next. These are the differences among the six scenarios: y1 Participants were told that the tax rate is 30%, with no mention of redistribution of tax revenues; y2 The tax rate remained at 30%, but all tax revenues were placed in a general fund which was subsequently divided equally among all participants; y3 A tax rate of 30% going to a general fund, with the lowest 20% of earners receiving slightly more from the fund than those with average and above incomes; y4 A tax rate of 30%, with revenues going to the national government (Department of Treasury); y5 A tax rate of 30%, with revenues going to the Social Security, Retirement System (National Pension Scheme); y6 A tax rate of 30%, with revenues going to the local Fire Department.

Data interpretation

In figure 1 I present the distribution of tax compliance decisions by participants in all the six rounds of the experiment. As it can be easily seen, the number of decision of full compliance, where a participant report 100% of his income is significantly higher than in any other countries. Furthermore, Romania has the lowest number of participants that reported 0% of their earnings. Thus, Romanian participants do not have the same profile as the rest of the countries, but not in the expected direction, but the opposite.

Figure 1. Distribution of tax compliance decisions by country

To understand the factors that explain the higher level of tax compliance under experimental conditions in the case of the Romanian participants, in table 1 I present the results of a regression analysis run separately on each of the five countries. Y2 to y6 represent the comparative reaction in these stages of the experiment when compared with the baseline, y1 choice. Peculiar to Romanian participants is that none of the stages has a positive or negative significant difference when compared with the baseline. Instead, in all other countries at least one of the stages led to statistically different reactions. Compared with the interpretation of the data in figure 1, this implies that means that the default position of the Romanian participants was to fully report their incomes, and not alter their strategy based on the different structure of incentives

presented in different rounds. The questions regarding the preference for free market and opinion towards wealth accumulation does not have a negative effect on the level of tax compliance under experimental conditions. Also, the question regarding the level of trust in the national government does not have an explanatory power on the level of tax compliance. Instead, the Social Value Orientation angle is not a statistically significant predictor of compliance only in the case of Romania. Thus, while in the other countries, people with more prosocial attitudes tend to be more tax compliant, in Romania this feature does not make a difference, maybe also given the high level of tax compliance. As in Italy and Sweden, the level of tax morale does not affect tax compliance. Instead, the tax morale has a positive effect on compliance in the UK and the US. Last but not least, the other variable where the behavior of Romanians is peculiar is the risk aversion. While risk aversion is negatively associated with tax avoidance in all countries, in Romania this is not the case.

Conclusions

Base on this short data analysis, I conclude that the Romanian participants in this experiments where much less different than their counterparts from more developed counties than expected. To start with, Romanian Millennials manifest a significantly higher level of tax compliance under experimental conditions, under tight control variables. Overall, their tendency to act strategically given the different tax scenarios are being very limited, and they also do not exhibit variation in tax compliance based on their risk attitudes or social behavior. This data strongly indicates that the historical negative inheritance has apparently no measurable effect on the Romania's Millennial generation, when compared with the similar generations from mode developed countries. Nevertheless, given that this data was obtained under experimental conditions, this does not mean that through socialization their behavior could not be perverted in practice.

Abstract. *Recent years, the macroeconomic situation divulged a complex of problems in the quickly developing system of mortgage lending in Russia – the fall in the cost of property pledge, a sharp rise of the overdue arrears in the issued mortgage credits, the low efficiency of the work of Mortgage and Housing Lending Agency. In spite of the negative factors and conditions, accompanying the development of Russian system of mortgage lending, the experience of industrially developed countries shows that in the market economy the mentioned form of credit relations is one of the main instruments in solving social-economic problems – first of all, enhancing accessibility and providing the population with housing. There arises the objective necessity of modernizing the existing and developing the new trends in improvement of the mortgage lending system under the conditions of post-crisis development of Russian economy. The paper aims in the theoretical founding of the necessity to modernize the existing and develop the new trends in improvement of the mortgage lending system under the conditions of economic post-crisis development in Russia. We use the dialectical method, providing the objective character of study and the systematic approach to the examination of complex economic processes and phenomena. Methods of abstract-logical, comparative-analytical, statistical and economic-mathematical analysis were applied in different combinations on all the stages of the investigation. This enabled us to provide the grounds for the induced offsprings. We put forward a complex indicator to exercise estimation of the mortgage lending system functioning efficiency; to propose the algorithm of determining this indicator; to realize*

the economic-mathematical modeling of quantitative prospects for the national system of the mortgage. The monitoring of the mortgage lending system functioning efficiency in Russia showed the significant increase of efficiency in the organization of financial-economic and organizational-legal relations, formed in the process of mortgage lending system functioning. The proposed complex indicator acts as such, enabling to provide spatial-temporal compatibility of criteria and indicators of state in the primary and secondary markets of mortgage lending, to form the integral and accessible information base of the system development dynamics as well as of its elements, to expound the priority trends in the regulation of specific for this country type of credits.

Keywords: mortgage lending; integral efficiency indicator; credit organization; mortgage lending market; commercial bank.

Introduction

The research gap covered by this paper is a lack of an integrated approach to the methodological provision of Russian mortgage lending system functioning. Without integral approach, the high-interest rate stipulates high profitability in the business of the banking sector but tells negatively on the financial position of the population. The enlarging of benefit crediting on account of the budgetary means makes housing more accessible but leads to the additional load on the finances of the state. In this research, we provide an integral indicator for evaluating the efficiency degree of the state policy regarding mortgage lending, taking into account the budgetary, commercial and social-economic efficiency of the mortgage lending system.

The theoretical and historic grounds of the mortgage lending organization, the analysis of the global practice, first of all, in the developed countries, as well as the study of mortgage lending development problems in Russia are reflected in the works of Ambrose, Benjamin and Chinloy (2003), Becker, Osborn and Yildirim (2012), Booth and Walsh (2001), Chen, Chen and Chou (2010), Cushman (2012), Courchane, Darolia and Zom (2014), Crawford and Rosenblatt (1999), Diaz-Serrano and Raya (2014), Gary-Bobo and Larribeau (2014), Goremykin (2014), Mintz (2012), Nesiba (2003), Stolbov (2012), Torluccio and Dorakh (2011). In spite of a number of works of the above-mentioned authors, a significant number of materials in the problems of mortgage lending development, the specialists in this field are of no accord in the line of the most perspective trends in improving the mortgage lending system of Russia.

Therefore, being of a high opinion of the results, arrived at in the papers of the mentioned authors, we deem it necessary to note that there are a number of aspects, requiring keen analysis, introducing corrections and additions.

The progressive integration of the Russian economy into the world economic system requires incorporation of the national mortgage market into the international financial system. Participation in the international mortgage mechanisms leads to an intensification of cross-country capital movement, consolidation of the countries' financial spheres and approximation of international finance to the needs of the real economy, which will provide the basis for the stable development of the world economy.

In Russia, the mortgage lending institutions assume greater importance due to the systemic crisis recovery under the economic sanctions imposed in 2014. Development of the mortgage lending will allow diversifying business portfolios of national and international banks, insurance and investment companies. This is also necessary to improve the investment climate, to improve the standards and quality of living. The Russian mortgage market is at a critical juncture of its development, given its institutional deficiencies, infrastructural and administrative constraints imposed on its development.

The *Aim of the paper* is the investigation of one of the trends in improving the system of mortgage lending in the country, of the mortgage lending system efficiency complex estimation in the country, taking into account the interests of all the participants: of the population, state, financial-credit institutions, having at their disposal temporary free money units, and offering them for temporary use.

The *tasks* are: to investigate the topical problems of mortgage lending system functioning; to put forward the complex indicator to estimate the efficiency of mortgage lending system functioning; to examine the relevance of the worked out complex indicator practical application as well as of the presented algorithm, its defining in the estimation of mortgage lending system functioning efficiency; to realize economic-mathematical modelling of quantitative prospects in the national mortgage lending system development.

Materials and methods

In the present work, the key category is “the credit relations model”, because the organization of mortgage lending in different countries is characterized by special features, due to the various levels of their social-economic development, the specifics of financial-credit system functioning, historical and modern norms of legislation, regulating relations in the sphere of real estate pawn. Cross-country comparisons revealed a strong empirical relationship between levels of effectiveness of legal systems, comprehensive accounting and auditing standards, and credit registries, on the one hand, and the stability of financial systems, on the other hand (Badev et al., 2014, p.6). We can implement this rational approach to the classification of mortgage lending models in the developed and developing countries:

- the balanced autonomous model (contract-saving) of mortgage lending, based on allowance-saving functioning principle after the type of German “constructing savings-banks” (co-operatives);
- the reduced (traditional, one-tier or one-level, cut-open), a simplified model of mortgage lending, based on the primary transfer of pawns, presupposing the acceptance of securities on the provided credits by the clients of the financial-credit organization, and the next use of them as a provision for the part of attracted outer resources. This model of mortgage lending developed in Great Britain, France, Denmark, Spain, Israel and a number of other countries in Europe, Australia, South America, and also in such developing countries as Bulgaria, Poland, Hungary;
- the expanded open model (spread-open, two-tier, secondary mortgage market model), based on the secondary transfer of pawns, presupposing re-financing of financial-credit organizations with the help of securities market, specially organized for

this purpose – the securities, provided with pledges on the objects of real estate. A credit size depends on the client's income and credit history (Bricker et al., 2017). The present model of mortgage lending got development in the USA. It is noteworthy that the spread-open model of mortgage lending acts as a priority in Russia. Let us explain this further.

The *balanced autonomous model* is a "closed" financial structure, starting with the formation of an authorized capital – the source of financing to provide credit. Moreover, all the funds of the "construction bank", both equity and debt, are used only to fulfill its statutory activities, i.e. these funds are spent on real estate construction and granting housing loans. The balanced autonomous (contract-saving) model of mortgage lending is most successfully practiced in Germany and involves the following stages: within 2-10 years prior to the purchase of the real estate object, the creditor begins to make targeted savings in the "construction banks" or other specialized financial and credit institutions; once the amount reaches 45.0% of the property value, the buyer receives a state subsidy at a rate of 10.0% of the property value, along with a subsidized loan for 10-15 years to cover the remaining cost (Carragher & Webster, 2011).

The use of balanced autonomous model (contract-saving) of mortgage lending in real estate construction in Germany is determined by the dominance of its advantages: being closed, it is not directly affected by changes in the financial market; the borrower does not have to confirm his income, since his solvency is checked at the stage of saving; the interest rate on the mortgage is much lower than the average; the model ensures availability of loans for borrowers with different income levels and high efficiency of construction or acquisition of the real estate objects at low cost. The shortcomings are: the borrower has the right to purchase a real estate object only after the end of the saving period; this model helps to limit the volume of financial resources flow to the real estate sector due to restricting access of investors' resources to the mortgage market. There were several attempts to introduce cooperatives in Russia and recently there have been renewed attempts, but this practice remains underdeveloped (Mazure, 2012).

In Russia, the implementation of the surveyed mortgage-lending model is currently unreasonable because: it restricts the amount of mobilized resources only by the volumes of savings of investors interested in obtaining loans for purchase or construction of real estate, and does not cover savings and free financial resources of other economic entities; high inflation and a constant probability of an increase of its acceleration and increase in interest rates on competing savings programs and, accordingly, the need for higher government subsidies as the only way to preserve the attractiveness of contractual savings.

At present, the product line of some commercial banks operating in Russia offers special savings deposits or "mortgage deposits", which allow customers to collect a certain amount of savings within a few years, and then use it to pay part of the property cost and obtain a mortgage credit on better terms.

The relative simplicity determines the popularity of *reduced (cut-open) model*: in the Anglo-Saxon mortgage system, individuals may not notarize the act. At the same time, the subject of a pledge is not clearly defined (Blackwell & Kohl, 2017). Among the shortcomings are: interest rates on mortgage loans depend on the state of the national financial market, which affects the decline in lending activity during periods of crisis; no strict standards for mortgage lending – duration, cost; limited availability of credit

resources. Despite the fact that the reduced model (traditional, one-tier, cut-open) model of mortgage lending is a prototype of the market model for organizing credit relations, it is not acceptable in Russia.

In the *expanded open model*, mortgage lending with households acting as the borrower plays the key role. In the housing sector of Russia, private ownership of households in residential buildings is prevailing, and the cost of their houses significantly exceeds the annual income of their owners. Accordingly, obtaining a home loan in financial and credit institutions for purchase or construction of housing is almost the only means of financing, while mortgage lending is the most reliable loan method for economic entities. In the US, this model provided a huge growth in the real estate sector (Leathers, Raines & Richardson-Bono, 2015). It might be of interest to Russia since it involves self-sufficiency and self-financing; the model is rather stable due to the fact that most of the securities ensuring the inflow of credit resources have previously declared profitability and repayment period; it implies openness and focuses on obtaining financial resources from the capital market by independent investors.

Results and discussion: Methods of the mortgage lending system functioning efficiency

Complex estimation should be an integral indicator, which includes the data, taking into consideration different aspects of mortgage lending system efficiency – budgetary, commercial and social-economic. In this paper, we used statistic materials of the Central Bank of Russia (CBR), Rosstat, the data in official reports of the Housing and Mortgage Lending Agency (AHML).

The efficiency of the analyzed credit form is determined by social-economic, budgetary and commercial efficiency of mortgage lending. The subjects, acting as the pawnbrokers, creditors, and regulators of credit relations are the population (households), the state and the private sector. All these subjects pursue different aims: the population – improvement of housing conditions, the private sector – acquiring benefits, the state – enhancing the efficiency of the country's economy, overall, and improving the well-being of the population, in particular.

Our methods of the mortgage lending system efficiency estimation systematize the criteria and indicators for the estimation efficiency from different angles:

- it is supposed to carry on the estimation under the criteria and statistic indicators, considering social-economic, budgetary and commercial efficiency of the mortgage lending system, that ensures regarding the interests of all the parties concerned – the population, the representatives of mortgage community and the state;
- it is recommended to take into consideration the integral coefficient in the developed algorithm, that enables to compare the mortgage lending system management efficiency in dynamics and to estimate the condition of analogous systems in other countries (regions within the country).

The complex estimation of the mortgage lending system functioning efficiency presupposes several stages: constructing the rating system of the mortgage lending system functioning efficiency, based on the statistic indicators; carrying out the estimation of statistic indicators influence trends in the system of mortgage lending; developing an integral indicator of the mortgage lending system functioning efficiency in the country.

The set of the mortgage lending system functioning efficiency estimation criteria and the corresponding statistic indicators are represented in Table 1.

Table 1. The set of indicators, characterizing the mortgage lending system functioning efficiency (Composed on the base of the expert estimations method by Courchane, Darolia & Zom, 2014; Diaz-Serrano, 2015)

Criteria of estimation	Name of the indicator
social-economic efficiency	– the ratio of the amount of paid and issued mortgage credits – the level of the interest rate in mortgage lending – the level of the average terms in mortgage lending
budgetary efficiency	– the number of credit organizations – participants in the mortgage lending market – the number of credit organizations – participants in the secondary mortgage lending market – the number of overdue payments in mortgage credits
commercial efficiency	– the number of issued mortgage credits – the number of mortgage credits re-financing

The indicators, reflected in Table 1 and participating in the determining of the mortgage lending system functioning efficiency, are not always the same in value, and their mere sum may lead to an error in estimation of the integral indicator. This circumstance is explained by the following reasons:

- first, it is a generally accepted and necessary requirement for the calculation of any integral indicator to compare all the indicators of estimation, from the point of view of the universal system of measuring;
- second, the high figure of the integral indicator can be got through high figures of the less important statistical indicators, while the more important ones will have rather insignificant figures.

In this respect, there arises the necessity to apply weight figures to the indicators, participating in the mortgage lending system functioning efficiency determination. It is noteworthy, that the determination of weights in statistical figures through purely mathematical methods is impossible. That is why, in order to solve the arising problem, the most important of heuristic methods of investigation – the expert estimations method – was used. The received results testify to the fact, that the most important characteristics of the mortgage lending system functioning process efficiency are „social-economic results” (20 points), and the least one – is „commercial results” (12 points). The specialists in the banking business, on the whole, and in mortgage lending, in particular (Mintz, 2012), stick to the same position, regarding the mortgage lending system development as aimed in providing accessible housing for the Russian citizens – the system, basing on market principles, free from monopolism.

The next stage is the figuring of weights of each criterion, characterizing the efficiency of the mortgage lending system functioning efficiency by means of dividing the total estimation of the expert groups' members in each criterion by the total sum of estimations. The results of ranging the values of the mortgage lending system functioning efficiency criteria, based on the set of statistical indicators, in combination with the opinions of experts together with the calculations of the indicators weights are cited in Table 2.

Table 2. The final rating and weight of criteria in mortgage lending system functioning efficiency estimation (Composed by the authors on the basis of the data from AHML 2014, 2015, 2016; Rosstat 2014, 2017; CBR, 2018)

The criterion of the mortgage lending system efficiency evaluation	The final rating	The indicator weight
The criterion of social-economic efficiency	20	0,42
The criterion of budgetary efficiency	16	0,33
The criterion of commercial efficiency	12	0,25
Total	48	1

Thus, with the method of expert estimations, let us determine the weight figures of the statistical indicators inside the groups of the mortgage lending system functioning efficiency estimation criteria, where more than one indicator is calculated. Because the number of estimated positions is insignificant, a five-point scale was applied. The results of value ranging and calculating the weights for the criteria of social-economic, budgetary and commercial efficiency are reflected in Table 3.

Table 3. Ranging the values and calculating the indicators' weights for the criteria of social-economic, budgetary and commercial efficiency in the mortgage lending system (Composed by the authors on the basis of the expert estimations method by Courchane, Darolia & Zom, 2014; Diaz-Serrano, 2015)

The criterion of the mortgage lending system efficiency evaluation	The final rating	The indicator weight
The criterion of social-economic efficiency	20	0,42
The criterion of budgetary efficiency	16	0,33
The criterion of commercial efficiency	12	0,25
Total	48	1

The next stage in carrying out the complex estimation of the mortgage lending system functioning efficiency is determining the influence trend of each statistical indicator on the total indicator. This estimation was held, considering the leading Russian economists' positions Goremykin (2014) and Cochman (2012) put forward by them in their works, while analyzing this or that indicator. The opinions of experts are also taken into consideration – of those of the staff and the clients of the branches, additional offices of the Public Auctioneering Companies: Sberbank, Vneshtorgbank-24 (VTB-24), Rosselkhozbank, Gazprombank, situated on the territory of Magnitogorsk. The results of each statistical indicator's calculating trend in proportion with the total indicator during 2012-2016 are represented in Table 4.

Table 4. The estimation of statistical indicators' influence on the total indicator of the mortgage lending system functioning efficiency (Courchane, Darolia & Zom, 2014; Diaz-Serrano, 2015)

The indicators, enhancing the figure of the total indicator	Indicators, deteriorating the figure of the total indicator
$\Pi_{1.1}$ – the ratio of the amount of paid and issued mortgage credits	$\Pi_{1.2}$ – the level of the interest rates in mortgage credits
$\Pi_{2.2}$ – the number of credit organizations-participants of the secondary market in	$\Pi_{1.3}$ – the level of the average terms in mortgage credits
$\Pi_{3.1}$ – the number of issued mortgage credits	$\Pi_{2.1}$ – the number of credit organizations-participants in the primary market of mortgage lending
$\Pi_{3.2}$ – the amount of re-financing mortgage credits	$\Pi_{2.3}$ – the amount of arrears on mortgage credits

The carried out research testifies to the fact that statistical indicators have the contradicting influence on the state of the mortgage lending system. This fact should be taken into consideration in calculating the total indicator. The order of calculating the complex indicator of the mortgage lending system functioning efficiency estimation through the use of the statistical indicators integrity can be represented in the form of the following formula (1):

$$\Pi = \sum_{i=1}^n (P_i \times \sum_{j=1}^{\Pi_i} Q_{ij} \Pi_{ij}), \quad (1)$$

where P_i is the weight of the point in the i^{th} group of statistical indicators, or the value of statistical indicators separate group in the total estimation, $\sum P_i = 1$;

Q_{ij} – the weight of the point in the j^{th} statistical indicator in the i^{th} group, or the value of the separate indicator in the corresponding group, $\sum |Q_{ij}| = 1$. In case, if the increase of the j^{th} indicator tells positively on the quality of the mortgage lending system, then $Q_{ij} > 0$; in another case - $Q_{ij} < 0$;

Π_{ij} – the j^{th} statistical indicator, included in the i^{th} group, or its deviation from the optimal measure, in case, it does not fall under the range of optimal meanings;

– n – the number of indicators' groups (in our case $n = 3$);

– Π_i – the number of statistical indicators in the i^{th} group (in our case $\sum \Pi_i = 8$).

The results of calculating the complex indicator, represented in Table 5, enable us to speak about the enhancing of financial-economic and organization-legal relations organization efficiency. These relations are formed in the process of the mortgage lending system functioning under the Russian conditions from 0,97 in 2012 to 1,34 in 2016 (Table 5).

Table 5. The dynamics of the mortgage lending system efficiency integral indicator in the Russian Federation (Composed by the authors on the basis of the data from AHML 2014, 2015, 2016; Rosstat 2014, 2017; CBR, 2018)

Year	2012	2013	2014	2015	2016
The Figure of the Integral Indicator	0,97	0,98	0,95	1,17	1,34

So, the special complex indicator, proposed in the framework of the present article, ensures spatial-temporal compatibility of the criteria and indicators in the state of the primary and the secondary markets of mortgage lending, forming the universal and accessible information base in the dynamics of system development, as well as of its elements, exposing priority trends in regulation of the country-specific kind of crediting through the analysis and indicator diagnostics.

Today, residential construction in Russia is dependent on mortgage lending, which rates are high in comparison with Western countries. To adapt different mortgage models used in foreign countries to the Russian conditions, it is necessary to implement the following provisions in domestic legislation: implementation and realization of mortgage mechanisms with State participation; introduction and implementation of leasing schemes to purchase housing; development of the federal and regional programs to prevent risks in the housing market; interaction of the Bank of Russia and commercial banks to provide housing for the population.

Today it is objectively necessary to develop savings and loan programs institutionalized through construction banks. However, challenges remain such as standardization of mortgage lending procedures, its maintenance, and refinancing, reduction of transaction risks and costs, the enhanced development effectiveness of mortgage markets.

Conclusions

The examination of the financial-economic and organization-legal relations on the whole, arising in the framework of the Russian mortgage lending market exposed the insufficient working out of the issue under consideration – the lack of the unified approach to the study on the base of statistic indicators and the total indicator of efficiency in the country's mortgage lending system functioning.

The analysis of three key models, characteristic of the foreign practice in mortgage lending, their compatibility with the national priorities enable us to point out the initial positions of any order forming the system of credit relations in question in the country, namely: guarding the creditor's and the debtor's interests in the mortgage lending relations; providing conditions of mortgage credits accessibility to the common citizens and, in the credit sphere – the priority for organizations, specializing in mortgage lending; activation of the state part in mortgage lending relations.

In the framework of the present paper we issue the algorithm, which *in contrast to the already presented* in the literature methods aids, systematizes the criteria and indicators of the mortgage lending system functioning efficacy of the estimation, grounding on the following stages: constructing the rating system, estimating the criteria of the mortgage lending functional efficiency, regarding the total of statistical indicators: carrying out the estimation of influential trends of statistical indicators in the state of the mortgage

lending system; working out the integral indicator of the country's mortgage lending system functioning efficiency.

The results enable us to speak about the significant efficiency enhancing of the financial-economic and organization-legal relations, forming in the process of the Russian mortgage lending system, from 0,97 in 2012 to 1,34 in 2016. The practical application of the developed complex indicator provides the possibility of economic-mathematical modeling in quantitative prospects of the national mortgage lending system and is a need for the state, but also provides banks instruments for making forecasts and improving the efficiency of their business. The implementation of a proposed algorithm for mortgage lending system efficiency assessment can strengthen Russia's positions in the global financial market and reduce social tension caused by low level of housing affordability for the simple citizen who borrows money from banks.

Abstract. *Small and medium business plays an important role in the social and economic development of many countries. In spite of its importance, small business faces many problems. As a result, according to some estimates, about 30% of new small businesses stop running during two years, and about 50% – within five years; according to other estimates – about 60% of businesses get closed during three years. These circumstances cause growth interest in various aspects of the development of small and medium businesses from the scientific community. At present higher flow of information in all fields emphasizes the necessity to identify methods and approaches to optimize its structure and determine key researches. The purpose of this article is to set out perspective directions in reviewing the development of small and medium business based on the bibliometric analysis. The study used the following methods and tools: a) CiteSpaceV program, which allowed to define the perspective directions of researches on the basis of a co-citation method and to visualize research fronts; b) the semantic analysis methods, which allowed to define the directions of researches on the frequency of used terms. The scientific publications presented on Web of science and Russian Science Citation Index from 2010 to 2016 formed information base of a research. The study revealed the main directions in the area of entrepreneurship of small and medium businesses that include market orientation, international entrepreneurship, innovative knowledge, financial crisis, data quality factor, and social responsibility. The results show that there are considerable differences between the directions of researches of the Russian scientists and the world scientific community. Russian publications are more aimed at theoretical rather than practical research. A bid internal problem is the absence of feasible space of knowledge, uniting scientific schools, competence centers, scientific centers and working groups. The study investigates the causes of the gaps in the field of small and medium businesses studies. Comparison of research fronts on foreign publications with Russian subjects may form a basis of forecasting perspective research directions.*

Keywords: *small and medium business; research fronts; bibliometric analysis.*

Introduction

Small and medium business plays an important role in the social and economic development of many countries. In spite of its high social and economic importance, small business faces many problems. As a result, according to some estimates, about 30% of new small businesses stop running during two years, and about 50% – within five years (Solomon, Bryant, May, & Perry, 2013); according to other estimates – about 60% of businesses get closed during three years (Mrva & Stachová, 2014).

Although now Russian authorities emphasize the importance of developing this sector of the economy, its share in the national economy is much lower than abroad (figure 1).

Figure 1. The number of small and medium enterprises, the average size of small and medium enterprises and the share of small and medium enterprises in the GDP of various countries (Source: Ministry of Economic Development of the Russian Federation, 2016)

Comparing the level of small and medium business development in Russia with other countries, we can see that we are lagging dramatically behind by a number of indices. For example, the share of small and medium business in GDP of many foreign countries exceeds 40% (circumference diameter in Figure 1), while in Russia it is 22 %. The similar situation is with the share of personnel employed in the small and medium business. In Russia, the small and medium business provides employment of 25% of the population, while in developed countries this parameter varies from 35% to 80%. The number of small and medium businesses per 1000 people in Russia is more or less the same as other countries. But the average amount of added value, produced by one small or medium business, is much lower than abroad.

Therefore, it is a must to carry out a comprehensive analysis, reviewing not only possibilities in developing small and medium business in economic systems but also Government instruments, affecting the development of this sector of the economy. At present, a higher flow of information in all fields emphasizes the necessity to identify methods and approaches to optimize its structure, determine key researches, which constitutes the purpose of this review (Albort-Morant & Ribeiro-Soriano, 2016).

A list of contemporary research fronts is continually updated and published by Clarivate Analytics (Clarivate Analytics, 2017). Recently, a large number of bibliometric studies in the field of entrepreneurship development have appeared. The authors consider various aspects of the development of entrepreneurship, such as the birth of new firms (Dzikowski, 2018), the impact of business incubators (Albort-Morant & Ribeiro-Soriano, 2016), and social entrepreneurship (Rey-Martí, Ribeiro-Soriano, & Palacios-Marqués, 2016). In modern Russian publications some bibliographic reviews are presented, but unfortunately, there are no techniques for conducting a full bibliometric analysis.

The purpose of this article is to set out perspective directions in reviewing the development of small and medium business based on the bibliometric analysis.

Methods of research

Identification of prospective directions for these studies in the field of Small and medium business has been conducted via bibliometric analysis and based on technology of identification of prospective research fronts, the methodic of which is widely represented in foreign scientific publications (Dzikowski, 2018; ; Merigó & Yang, 2017, Laudano, Marzi, & Caputo, 2018, Rey-Martí, Ribeiro-Soriano, & Palacios-Marqués, 2016).

To identify perspective lines of research in the sphere of small and medium business development, we will stick to the following stages.

At the first stage, keywords were established to determine perspective research lines. Used in the capacity of keywords were “SME”, “small and medium enterprises”, “small and medium-sized businesses”, considering logical conditions and combinations. These keywords reflect the maximum extent of the research directions.

At the second stage of the study, a selection of scientific methodological bases for the study was carried out. Currently, there are many databases of peer-reviewed literature such as Scopus, Web of Science, Astrophysics, PubMed, Mathematics, Chemical Abstracts, Springer, Agris, GeoRef etc. Bases like Web of Science and Russian Science Citation Index were selected because they are scientific metric bases, used to assess the work efficiency of scientists in Russia. One of the limitations of the Russian Science Citation Index is an impossibility to unload research results, hampering further analysis. The use of various databases facilitated parallel research in each database separately.

At the third stage, an original pool of scientific publications was made, using keywords for both scientific metric bases. On Web of Science and Russian Science Citation Index databases, 12251 and 18722 publications were received respectively. As shown by preliminary analysis of received publications, some articles, represented in the Web of Science, run counter to the research profile, referring to other spheres of science, such as physics, chemistry, medicine, astronomy. Selection of articles in the Russian Science

Citation Index also included articles, not in compliance with the research profile. That is why at the fourth stage all articles were checked for compliance with the research profile, canceling some of them.

The difference between databases and possibilities to perform their analysis predetermined the use of different methods and instruments. At the subsequent stage, while analyzing publications, received from the Web of Science, a freely distributed product was used CiteSpaceV (Li, Ma & Qu, 2017), making it possible to do without duplicate information.

During bibliometric analysis in the Russian Science Citation Index, a content-analysis was done of major publications. The procedure of content-analysis is to squeeze a text under review within a limited framework of certain elements, which are subsequently calculated and analyzed. Special attention is paid to the frequency of symbol use. Statistical analysis of publications vocabulary makes it possible to trace the penetration depth of new ideas and methods, which can be set by the frequency of word use, coding whole concepts. Every year between 2010 and 2016, selected were 30 most quoted publications. The search was based on names, keywords, annotations and bibliographic list by means of the information resource, capable of semantic analysis. For each period under review, based on mostly used word combinations, a semantic core was determined, outlining basic research directions of Russian scientists.

At the last stage, carried out was a comparative analysis of researches, presented in the Web of Science and Russian Science Citation Index.

The main limitation of the research made is the impossibility of comprehensive analysis of publications, presented in the Russian Science Citation Index. Still, these methods allow us to identify the main specific features of researching small and medium business development.

Results

The world scientific community is paying high attention now to the problems of small and medium business development, which is confirmed by the number of publications, rising each year (figure 2).

As shown in the Figure 2, the number of publications on problems of small and medium business development, presented in the Web of Science, is on the rise. The number of publications, presented in the Russian Science Citation Index, during 2010 – 2016 is much higher than that of the Web of Science. As shown in the detailed review of Russian publications in the sphere of small business development, such significant excess is due to duplicating research results in different magazines, or due to absolutely or partially same names, which is unacceptable for leading world publishers.

Figure 2. Dynamics of the publication activity of scientometric databases Web of Science (WoS) and Russian Science Citation Index (RSCI)

Scientists throughout the world monitor closely problems of regional economic development (figure 3).

Figure 3. Distribution of publications by country in the Web of Science

As seen in the Figure 3, most publications are in China, around 20% of all, related to problems of small and medium business development, England accounts for about 9%, and USA – 6%, of those presented in the Web of Science. The share of Russian publications is less than 1% of the total.

To identify prospective research directions, publications, presented on the Web of Science platform, were clustered by means of CiteSpace V software.

As a result of the analysis 6 research fronts were determined (figure 4).

Figure 4. Research fronts in the field of small and medium business development

Analysis of publications, being a part of major identified clusters, made it possible to set out and form their main subjects. Depending upon names of publications, keyword and other information, subjects of research fronts were determined. The period of research front formation is the one, having highest intensity of quotation on the specific scientific subject. The network is divided into 6 co-citation clusters. These clusters are labeled by index terms from their own citers. The largest 2 clusters are summarized (table 1).

Table 1. Summary of the largest 2 clusters

Cluster ID	Size	Silhouette	Label (LLR)	Label (MI)	Mean (Citee Year)
0	19	0,746	market orientation	SME characteristics (1,51); diffusion way (1,51); relevant successful experience (1,51); exploring management perspective (1,51); geographic scope (1,51); service SME (1,51); Mexican software industry (1,36); formalizing network development (1,36); innovation capabilities (1,36); bank ownership type (1,28); social responsibility (1,28); bank financing (1,28)	1991
1	10	0,637	international entrepreneurship	SME characteristics (0,24); geographic scope (0,24); diffusion way (0,24); relevant successful experience (0,24); exploring management perspective (0,24); service SME (0,24); Mexican software industry (0,21); formalizing network development (0,21); innovation capabilities (0,21)	1995

The largest cluster (#0) has 19 members and a silhouette value of 0,746. It is labeled as market orientation by LLR, relationship by TFIDF, and SME characteristics (1,51); diffusion way (1,51); relevant successful experience (1,51); exploring management perspective (1,51); geographic scope (1,51); service SME (1,51); Mexican software industry (1,36); formalizing network development (1,36); innovation capabilities

(1,36); bank ownership type (1,28); social responsibility (1,28); bank financing (1,28); bests practice intervention (1,25); long-term outcome (1,25); pharmaceutical industry (1,22); radical change (1,22); managing knowledge asset (1,22); public credit guarantee (1,2); different institution (1,2); employee-oriented CSR (1,18);) by MI. The most active citer to the cluster is 0,26 (Aziz & Mahmood, 2011).

The second largest cluster (#1) has 10 members and a silhouette value of 0,637. It is labeled as international entrepreneurship by LLR, internationalization by TFIDF, and SME characteristics (0,24); geographic scope (0,24); diffusion way (0,24); relevant successful experience (0,24); exploring management perspective (0,24); service SME (0,24); Mexican software industry (0,21); formalizing network development (0,21); innovation capabilities (0,21); bank ownership type (0,19); social responsibility (0,19); bank financing (0,19); bests practice intervention (0,19); long-term outcome (0,19); pharmaceutical industry (0,18); radical change (0,18); managing knowledge asset (0,18); public credit guarantee (0,18); different institution (0,18); entrepreneurs management innovation intention (0,17); employee-oriented CSR (0,17); foreign subsidiaries (0,17) by MI. The most active citer to the cluster is 0,5 (Kraus, 2011).

The vital problem for Russian scientists is outlining perspective directions of research in the field of small and medium business development. Russian database in the Russian Science Citation Index is just being formed and is not capable yet of a comprehensive bibliometric analysis. Used for bibliometric analysis were methods of semantic analysis. As a result, a semantic core was determined, reflecting the main direction of research by Russian scientists in the sphere of regional economic development. Main research directions are shown in Table 2.

As shown in Table 2, most Russian researches are of general nature, aimed at the development of small and medium business, identifying problems of its development during transformation to a new for modern Russia market economy. At the same time, starting from 2013 we have been witnessing publications, related to legal protection, the labor market, Republic of Crimea, social responsibility. This is confirmed by the appearance of such keywords during research, as taxation, regional development, agriculture.

Table 2. The semantic core of the most significant publications in Russian Science Citation Index

Year	The semantic core of publications (the frequency of use of words and phrases in parentheses,%)
2010	Small business (2.24), governmental support (0.86), innovative entrepreneurship (0.77)
2011	Small business (1.74), governmental support (1.54), Local government (0.86), support of small business (0.82)
2012	Small business (2.59), governmental support (0.83), innovative entrepreneurship (0.83), interaction of regional enterprises (0.7)
2013	Small business (1.73), economic growth (0.87), innovative entrepreneurship (0.74), legal protection (0.62)
2014	Small business (1.70), governmental support (1.13), Siberian Federal District (1.28), innovative entrepreneurship (0.78)
2015	Small business (1.36), governmental support (1.00), the labor market (0.96)
2016	Small business (2.10), governmental support (0.88), republic of Crimea (0.88), social responsibility (0.61)

The bibliometric analysis showed that Russia is outside of scientific research of mechanisms and ways to develop small and medium business. One of the problems is the absence of feasible space of knowledge, uniting scientific schools, competence centers, scientific centers and working groups. There are no comprehensive databases on results of research in scientific publications. Most organizations, involved in scientific research, have no access to renowned foreign databases on research and development, preventing them from assessment of world scientific and technical achievements, the discovery of scientific results, which can be interesting for Russian business.

Conclusion and discussion

That is why, the use of bibliometric methods is a good and convenient instrument to plan and assess scientific work, realizing scientific achievements.

As a result of the research, two main clusters were identified in the sphere of small and medium business development. Research fronts are inter-discipline clusters, incorporating publications from several adjacent fields. Research of clusters helped to determine vital subjects in this sphere and will contribute to further exploration of various issues of small and medium business development.

Results of publishing activity by Russian scientists manifest more intensive research of small and medium business in the Web of Science database. But according to the bibliometric analysis of scientific publications flow, there is a dramatic limitation in the exchange of scientific information. Poor communication between Russian scientists and their colleagues abroad causes clusterization of Russian research initiatives, slowing down the search for and identification of perspectives of Russian small and medium businesses development.

The bibliometric analysis showed that Russia is far away from scientific research fronts in the field of small and medium business development. Russian publications are more aimed at theoretical rather than practical research. A bid internal problem is the absence of feasible space of knowledge, uniting scientific schools, competence centers, scientific centers and working groups. There are no comprehensive databases on results of research in scientific publications. Most organizations, involved in scientific research, have no access to renowned foreign databases on research and development, preventing them from assessment of world scientific and technical achievements, the discovery of scientific results, which can be interesting for Russian business.

Comparison of research fronts on foreign publications with Russian subjects may form a basis of forecasting perspective research directions. But this activity requires profound research and its development may constitute an important factor in substantiating support for scientific research in Russia in the interests of small and medium business.

Abstract. *Many studies focus on the pre-internationalization phase and very few pay much attention to the post-internationalization phase. This study aims to bridge this gap, exploring the speed at which traditional firms, INVs, and Born-again-Global firms become international and their degree of internationalization, and how this process is reflected differently vis-à-vis innovativeness and competitive advantage. It is important to note that the firm's age when it carries out its first internationalization activity is what conceptually differentiates these kinds of firms. Based on a sample of 129 Portuguese metalworking firms, we develop several hypotheses to test. Surprisingly, new forms of firms (INVs and Born-again-Global firms) do not seem more innovative and do not have a greater competitive advantage.*

Keywords: *INV; internationalization; Born-Global; Speed; Degree; Innovation; Competitive advantage*

Introduction

Globalization promotes new opportunities for small and medium-sized enterprises (SMEs), which are expanding their activities to external markets, in order to gain a competitive advantage internationally. International New Ventures (INV) from their very inception broaden their horizons, leaving behind local views that usually characterize small new firms (Oviatt & McDougall, 1994). At the same time, the increasingly global environment has fueled the vision and business strategy of some traditional companies, driving them to suddenly expand across borders. These companies are referred to as *Born Again Global* (BaG) companies, as they suddenly internationalize after a long period of being focused on the domestic market (Bell, McNaughton, Young & Crick, 2003).

The extant literature extensively covers the period prior to the first internationalization period and the factors that influence the timing of entry into the international market, however, there are few studies that analyze the period after the company's initial entry into the foreign market.

This study intends to bridge this gap, by analyzing the different dimensions of internationalization after the first entry into the external market, both in traditional companies, and new forms of companies (INV and BaG) and their innovativeness and *competitiveness*. In terms of defining what differentiates these companies from each other is the time when they begin their internationalization process.

Literature review

Some studies suggest two central dimensions in the process of internationalization are *degree* and *speed* (Cesinger, Fink, Madsen & Kraus, 2012; Zahra & George, 2002). The degree of internationalization is related to the level of commitment of the company to its international expansion process (Casillas & Acedo, 2013). Speed is the time that elapses from the time the company is established to its first international activity. More strictly speaking, this is the starting speed. The speed of internationalization refers more specifically to the number of international activities that the company performs within a certain period of time after its first international activity (Casillas & Acedo, 2013).

New firms typically compete in global niche markets and are quite flexible in adapting to the needs of their customers (Rennie, 1993). Their ease of adaptation to new markets enables them to reach new international markets faster. Traditional firms have a more rigid stance, which hampers the process of adaptation to new international markets (Autio et al., 2000; Hilmeresson & Johanson, 2016), as they have to deconstruct some of the routines developed for the domestic market (Hilmeresson, Johanson, Lundberg, & Papaioannou, 2017), slowing them down. Therefore, Hypothesis 1a (H1a) is as follows:

H1a: The post-internationalization speed of new forms of companies is faster than the post-internationalization speed of traditional enterprises.

The new forms of companies have more in-depth market knowledge, partly driven by the founder's previous international experience, which allows them to make international commitment decisions more easily (Madsen & Servais, 1997), as well as establish new subsidiaries. Therefore, Hypothesis 1b (H1b) is as follows:

H1b: The speed at which new forms of enterprises are prepared to commit their resources to the outside is greater than the speed at which traditional enterprises are prepared to commit their resources to the outside.

De Clercq et al. (2005) report that companies that are more predisposed to participate in international activities have a greater degree of internationalization. Given their characteristics, the new forms of companies have a more international posture, since from the beginning they seek to sell their products to multiple countries (Oviatt & McDougall, 1994).

Reuber and Fischer (1997) point out that companies that have international entrepreneurs (usually INVs) that influence them to establish international strategic partnerships have a greater degree of internationalization. Therefore, Hypothesis 2 (H2) is as follows:

H2: The degree of internationalization of new forms of enterprises is greater than the degree of internationalization of traditional enterprises.

A company that is innovative is willing to abandon old routines and test new ideas (Menguc & Auh, 2006), developing or adopting new products and processes. New forms of companies are established in various world markets through the introduction of a unique and specialized product for each niche market. Thus, it is assumed that new forms of business must continually develop new products to meet the demand of the various markets. Therefore, Hypothesis 4 (H4) is as follows:

H3: The innovativeness of new forms of business is greater than the innovativeness of traditional enterprises.

Companies can enter international markets because they have valuable, unique assets (Oviatt & McDougall, 1994), which is a source of competitive advantage. Companies that seek competitive advantage through an intangible resource, such as knowledge, are more likely to develop learning skills useful for adapting to new markets than firms that rely almost exclusively on tangible resources (Autio et al., 2000). New forms of firms usually have a very dynamic organizational structure enabling them to develop knowledge-based products hard to imitate (Zahra et al., 2000). The capacity of the founder is also a source of competitive advantage for new forms of business since it allows opportunities in international markets to be detected and new ways of exploiting them to be developed (Zahra, 2005). Therefore, Hypothesis 5 (H5) is as follows:

H4: The competitive advantage of new forms of business is greater than the competitive advantage of traditional enterprises.

Methodology

A quantitative methodology is used in large samples to obtain an overview of the study area and to determine any patterns or inconsistencies in the sample (Park & Park, 2016).

The hypothesis test is a statistical inference process that aims to verify if sample data are compatible with certain populations. According to the study sample and the type of variables to be analyzed, parametric (*t-student* test) or non-parametric (Kruskal-Wallis and Wilcoxon-Mann-Whitney tests) statistical inference tests were used.

The population under study is the Portuguese metalworking sector (MM). It is a very heterogeneous sector that integrates a set of different activities in industry and offers a range of diversified products. Most of the activities produce goods to support the production of other sectors, that is, intermediate goods and capital goods or produce durable goods for final consumption. The MM sector represented 22% of all Portuguese companies, 26% of turnover and 25% of employees (INE, 2017a, 2017b 2017c) in 2015. In 2015, the MM sector reached the highest ever value of exports amounting to 14,968M€ of which 75% represents exports to the intra-Community market, while the remaining 25% represents exports to the extra Community market (INE, 2017d, 2017e). Thus, this sector occupies a central position in the Portuguese economy.

The instrument most commonly used in data collection, based on a quantitative approach, is the questionnaire. The questionnaire used for the purpose of this study consists of 30 questions, answered by a representative holding the position of CEO or similar.

By definition, the main difference between traditional enterprises and new forms of business is the time between the founding year of the company and the year of their first international activity. Questions 2 and 5, respectively, measure the year the company was founded and the year of its first international activity.

BaG companies are included in the new forms of companies. Question 16 identifies the companies that, as a rule, undergo a critical event that drives them to internationalization.

Firm size is measured through questions 3 (number of employees) and 4 (turnover).

International speed is understood as the relation between the amount of time between when a firm is first established and the first international events of a company (Casillas & Acedo, 2013). The company's uptime is measured by the difference between 2016 and question 2. The company's international events are measured through questions 13, 14 and 15, which were elaborated on the basis of the Transnationality Index-TNi (UNCTAD, 1995). TNi measures the ratio of foreign sales to total sales, the ratio of foreign assets to total assets, and the ratio of foreign employment to total employment. In order to determine the post- internationalization speed TNi is divided by the company's activity time, the difference between the current year of the company's activity and the year of the first internationalization activity. The speed of international commitment is measured through question 10, taking into account the time elapsed since the first international activity.

The degree of company internationalization is the level of the company's commitment to its international expansion process (Casillas & Acedo, 2013). To measure the degree of internationalization, there is a multiplicity of variables as mentioned in the literature review. Questions 8, 12, 13, 14 and 15 measure these variables, the last three questions answering the TNi and question 12 allows the Network Spread Index (NSi) variables to be measured.

Based on the following:

$$TNi = \frac{\frac{\text{Foreign Sales}}{\text{Total Sales}} + \frac{\text{Foreign Actives}}{\text{Total Actives}} + \frac{\text{Foreign Employees}}{\text{Total Employees}}}{3}$$

$$Nsi = \frac{n}{n'}$$

n = countries with subsidiaries

n' = all possible countries

$$\text{InternationalizationDegree1} = Nsi \times Tni$$

$$\text{InternationalizationDegree2} = \frac{\text{Foreign Sales}}{\text{Total Sales}}$$

Innovativeness reflects the company's tendency to engage and support new ideas and experiences that may result in new products, services or processes (Lumpkin & Dess,

1996). The scale for measuring innovativeness was validated and tested by Uz Kurt et al. (2012) and used in the present study with appropriate adaptations.

According to Sigalas et al. (2013), competitive advantage reveals itself when a company exploits market opportunities and neutralizes competitive threats superior to the industry in which it is inserted. The authors developed a four-point scale to measure the competitive advantage, which was adapted to the present study. Topics 27 and 28 measure the exploitation of market opportunities, while questions 29 and 30 measure the neutralization of competitive threats.

Results and discussion

Of the 13,369 companies in Portugal in the sector, 6,100 email addresses were collected, to which the research questionnaire was subsequently sent. 129 valid answers were provided.

54% of companies have a turnover of fewer than 2 million euros, 36% have a turnover between 2 to 10 million and 10% of companies have a turnover of between 11 and 50 million, and none have a turnover of over 50 million euros. According to this criterion, 100% of the companies in the sample are SMEs.

26% of the companies have less than 10 employees, 48% have between 10 and 50 employees, 23% between 51 and 250 employees and only 3% have more than 250 employees. Therefore, according to this criterion, 97% of the sample companies are SMEs.

44% of companies are considered INV since their first international activity occurred in or before their third year of existence (Knight & Cavusgil, 2004; Nordman & Melén, 2008). Traditional companies represent 44% of the sample, about 12% of companies are BaG, as they had a long period when they were only active in the domestic market and then suddenly expanded internationally, driven by a critical event. Some of the main critical events presented by such companies were a change of owners or the governing body and/or an alteration in the international attitude of customers that led them to follow the path of internationalization.

Velocity

Table 1. Kruskal-Wallis test for speed between new forms of companies and traditional companies

	ET	Sig. (2-tailed)	Decision
Speed1	25.715	0.000	Reject H0

Taking into account the results present in Table 1, considering the *p-value*, there is sufficient statistical evidence to reject the null hypothesis. Thus, it is possible to conclude that there are significant differences in the post-internationalization velocity of the new forms of companies and traditional companies.

To test if the post-internationalization velocity INV is identical between INVs and traditional firms, the *t-student* test for independent samples is used (Table 2).

Table 2. Test *t-student* for speed 1 between INV and traditional companies

		Levene Test		T Test	
		F	Sig	T	Sig (bilateral)
Speed1	Equal Variance Assumed	13,403	0,000	2,789	0,006
	Equal Variance not assumed			2,763	0,008

As the hypothesis is "the post-internationalization speed of new forms of enterprises is greater than the post-internationalization speed of traditional enterprises", a unilateral test is required.

Concerning the observed data, $t = 2.763$, then the $p - value\ unilateral = \frac{0,008}{2} = 0,0004 < \alpha = 0.05$, is estimated. There is sufficient statistical evidence to reject H_0 . According to the results obtained, INVs present post-internationalization velocity higher than traditional companies.

Table 3. Wilcoxon Mann-Whitney for velocity 1 between BaG companies and traditional business

		Ranks		
	Type	N	Mean Rank	Sum of Ranks
Speed1	Traditional	54	31.89	1722.00

Wilcoxon W		1722.000
Z		-2.452
Asymp. Sig. (2-tailed)		.014
Exact. Sig. (2-tailed)		.013
Exact. Sig. (1-tailed)		.007
Point Probability		.000

a - Grouping Variable: Type

To test whether the post-internationalization speed of BaG companies is identical to the post-internationalization speed of traditional firms, the Wilcoxon-Mann-Whitney test is used for independent samples (Table 3). In this case, we intend to carry out a one-sided test to the right, so that the one-sided (exact) *p*-value is used. With the ***p-value* = 0,007**

$\alpha = 0.05$, then H_0 is rejected. Therefore, the post-internationalization speed of BaG companies is higher than the post-internationalization speed of traditional businesses.

Table 4. Wilcoxon Mann-Whitney for velocity 1 between INV and BaG

	Type	Ranks		
		N	Mean Rank	Sum of Ranks
Speed1	INV	53	37.21	1972.00
	BaG	15	24.93	374.00
	Total	68		

Test Statistics^a

	Speed1
Mann-Whitney U	254.000
Wilcoxon W	374.000
Z	-2.126
Asymp. Sig. (2-tailed)	.034
Exact. Sig. (2-tailed)	.033
Exact. Sig. (1-tailed)	.016
Point Probability	.000

a – Grouping Variable: Type

To test whether the post-internationalization velocity of INV is statistically different from the post-internationalization velocity of BaG firms, the Wilcoxon-Mann-Whitney test is used for independent samples. In this case, we aim to carry out a one-sided right-hand test, so that the unilateral p-value is used to analyze the results. With the $p\text{-value} = 0,016 < \alpha = 0.05$, then H_0 is rejected. In conclusion, there is a significance level of 5%. Thus, the post-internationalization speed of INV is higher than the post-internationalization speed of BaG companies.

The speed of internationalization is also quantified through other individual indicators, such as commitment speed. Speed2 refers to the speed at which companies commit their resources abroad.

Table 5. Kruskal-Wallis test for speed2 between new forms and traditional companies

	ET	Sig. (2-tailed)	Decision
Speed2	2,252	0.324	Not Reject H_0

In order to test whether the speed at which companies commit their resources to the outside is identical in the new forms and in the traditional companies, we use the Kruskal-Wallis test. Through the observation of the p-value (Table 5), it is possible to conclude that with a significance level of 0,05, there are no statistically significant

differences. Therefore, the speed at which companies commit their resources to the outside is identical in the new forms of companies and in the traditional companies.

The null hypothesis- "The post-internationalization speed of new forms of enterprises is identical to the post-internationalization speed of traditional enterprises" -is rejected. Therefore, new forms of companies (INV, BaG) have a higher post-internationalization speed than traditional companies. This result is consistent with the extant literature since companies that are internationalized at an early stage seem to be faster to internationalize (Chetty et al., 2004; Hitt, Li & Xu, 2016). Rapidly expanding companies will gain experience in different environments, which is then absorbed into the company's know-how and will then be used in different external markets (Hilmersson & Johanson, 2016). On the other hand, companies that expand gradually face challenges and a lack of flexibility in their routines, taking longer to acquire the resources needed to enter new markets (Autio et al, 2000; Hilmersson & Johanson, 2016).

INVs have a higher velocity than the BaGs. This is not surprising, as BaG companies are older companies, with more established procedures, so they have to acquire knowledge about the markets, therefore taking more time. However, these companies are very close to INVs due to their ability to expand rapidly.

The second null hypothesis - "the speed at which new forms of enterprises commit their resources to the outside is identical to the speed at which traditional companies commit their resources to the outside" -is not rejected. Following the traditional approach, companies make difficult decisions to strengthen their position in the external market (Johanson & Vahlne, 1990). The company with the greatest speed of internationalization is likely to be involved in greater resource commitments (Johanson & Vahlne, 1990, 2009). In the first hypothesis, it was determined that the new forms of companies have a higher speed than the traditional companies, as we had expected since they commit resources abroad at a higher speed. However, this does not happen; the speed of commitment of the new forms of companies is equal to that of traditional companies. It should be noted that the sample is made up of companies from the metalworking sector, an industry which is highly active in the export sector. This sector belongs to the "heavy industry" sector, the lead time of much of its equipment is high, extending for many months. Given the specialized dimensions of much of the equipment produced by this sector, it is often necessary to manufacture and assemble the equipment for international customers, which leads to a displacement of company employees to the international markets. This explains why the resource commitment rate of traditional businesses and new forms are similar.

Degree

The degree of internationalization was measured in two ways.

"Degree1" is composed of a combination of two distinct indexes, the TNi and the NSi.

Table 6. Kruskal-Wallis test for degree1 between new forms and traditional companies

	ET	Sig. (2-tailed)	Decision
Degree1	0.434	0.805	Not Reject H0

According to the results (Table 6) obtained for the Kruskal-Wallis one-way analysis of variance, with the $p - value = 0,805 > \alpha = 0.05$, then there is not enough statistical evidence to reject H0. Therefore, the conclusion drawn is that the degree of internationalization, measured by the combination of TNi and NSi, is equal for the new forms and traditional companies.

"Degree2" is measured by the ratio of the external sales to total sales.

Table 7. Kruskal-Wallis test for degree2 between new forms and traditional companies

	ET	Sig. (2-tailed)	Decision
Degree2	6.912	0.032	Reject H0

According to the Kruskal-Wallis test (Table 7), with the $p - value = 0,032 < \alpha = 0.05$, there is sufficient statistical evidence to reject H0. Therefore, there are significant differences in the volume of exports between the new forms and traditional companies.

Table 8. Test t-Student for the volume of exports between INV and traditional companies

		Levene Test		T Test	
		F	Sig.	T	Sig (bilateral)
Degree2	Equal Variance Assumed	6.160	0,015	2.839	0,006
	Equal Variance not assumed			2,868	0.005

Analyzing the result of t-test (Table 8) for "equal variances not taken", it appears that $t=2.868$, whereby the $p - value unilateral = \frac{0,005}{2} = 0,00025 < \alpha = 0.05$, there is enough statistical evidence to reject H0. Therefore, the volume of exports of INV is higher than the volume of exports of traditional companies.

The Wilcoxon-Mann-Whitney test is used to compare the volume of exports of traditional companies with BaG companies. We used a unilateral test to the right (Table 9), with the $p - value unilateral = 0,068 < \alpha = 0.1$. There is adequate statistical evidence to reject H0. Therefore, we conclude, with a significance level of 10 %, the volume of exports of BaG companies is higher than the volume of exports of traditional companies.

Table 9. Wilcoxon Mann-Whitney test for degree2 between traditional and BaG companies

Degree2	Ranks			
	Type	N	Mean Rank	Sum of Ranks
	Traditional	47	29.56	1389.50
	BaG	15	37.57	563.50
	Total	62		

Test Statistics^a

Degree2	
Mann-Whitney U	261.500

Z	-.421
Asymp. Sig. (2-tailed)	.673
Exact. Sig. (2-tailed)	.679
Exact. Sig. (1-tailed)	.340
Point Probability	.003

a – Grouping Variable: Type

Finally, in order to compare the volume of exports of INV with BaG companies, the Wilcoxon-Mann-Whitney test is also used (Table 10). With a significance level of 5 %, we can conclude that there are no differences in the volume of exports of INV and BaG companies.

Thus, the null hypothesis– *“the degree of internationalization of new forms of enterprises is identical to the degree of internationalization of traditional enterprises”* –is not rejected. New forms of companies (INV, BaG) have a degree of internationalization equal to traditional firms. This contradicts the extant literature, in the sense that firms that are more predisposed to participate in international activities have a higher degree of internationalization (De Clercq et al., 2005). The measure used to quantify the degree of internationalization indicates that the degree of internationalization increases the higher the percentage of activities abroad and the more these activities are disseminated in foreign countries. Thus, we would expect that the new forms of companies maintain more activities abroad, by being more flexible and benefitting from faster learning, and consequently, they have a higher level of commitment to the markets in which they operate. However, as has been tested, commitment in terms of resources to markets is the same in new forms of business and in traditional enterprises. At the same time, one would expect the new forms of companies to be more highly dispersed worldwide, in global niches, in order to be able to offer specialized products to global market niches (Rialp et al., 2005). However, in the MM sector, the new forms of firms have the same degree of internationalization as traditional firms. According to Johanson et al. (1988), the internationalization level of the company is related to its network (industry) level of internationalization. It is through their network that companies develop relationships that ensure access to important resources (Johanson et al., 1988). Thus, the fact that the companies under study are situated within a sector that is highly integrated with the outside, provides them with the same degree of international engagement, regardless of the company’s age when its first internationalization activity took place.

The null hypothesis– *“the volume of exports of new forms of enterprises is identical to the volume of exports of traditional enterprises”* –is rejected. It has been found that INVs have a higher volume of exports than traditional companies. The age at which the company begins its internationalization process is an important indicator to predict export volume in subsequent years (Moen & Servais, 2002). In fact, in the run-up to their entry into the international market, new forms of companies explore and evaluate ideas and markets, as well as locating unique resources that influence their long-term performance, level of exports (Trudgen & Freeman, 2014). This result is consistent with the literature. With regard to BaG companies, they have a higher export volume than traditional companies and have an equal volume of exports when compared to INVs. This result is not surprising, as BaGs are driven by critical events that lead them to follow a rapid internationalization path (identical to INVs).

Innovation

To measure innovativeness, we used a scale developed by Uzokurt et al (2012). The scale was adapted and has been validated (Cronbach's alpha-0.884, CR-0.907, AVE-0.526). The scale was reduced to 9 independent items, which in turn were reduced to one factor.

Table 11. Kruska-Wallis test for innovation between new forms and traditional companies

	ET	Sig. (2-tailed)	Decision
Innovation	2.063	0.357	Not Reject H0

It is verified (Table 11) that the null hypothesis is not rejected. This result contradicts what we expect, innovativeness means that a company is proactive, exploring new market opportunities, a feature that appears in the literature as intrinsic to new forms of business. Traditional companies tend to be more reactive to the market and to the development of new products and processes, taking a more opportunistic stance, which consequently will lead to a lower level of innovation vis-à-vis new forms of companies. The results obtained indicate that the level of innovativeness of the new forms of companies and traditional companies is identical.

Competitive advantage

To measure the competitive advantage, we used a scale developed by Sigalas et al. (2013), adapted and validated (Cronbach's alpha-0.898, CR-0.907, AVE-0.763). We chose to use a 7-point Likert scale, as an increase in the number of points on the scale is accompanied by an increase in scale reliability (Berk, 1979).

Table 12. Kruska-Wallis test for competitive advantage between new forms and traditional companies

	ET	Sig. (2-tailed)	Decision
Competitive Advantage	0.367	0.832	Not Reject H0

As the p-value is over $= 0.05$ (see Table 12), there is not enough statistical evidence to reject H0. The null hypothesis- "*the competitive advantage of new forms of business is identical to the competitive advantage of traditional enterprises*" -is not rejected. This result contradicts what we expect. According to the literature, new forms of companies have the ability to adapt to new markets, developing products tailored to their customers' requirements. These companies tend to offer adapted products, resulting from product innovation, they offer their customers unique products that are difficult to imitate, ensuring a source of competitive advantage. However, it was found that new forms and traditional enterprises have the same degree of innovation. Consequently, it does not come as a surprise that the level of competition between the two companies is also identical since theoretically, the increased competitiveness arises from the higher degree of innovativeness.

Conclusion

New forms of firms do not behave very differently from traditional firms (at least in most of the dimensions analyzed, and in the context of the metalworking sector), as

companies that internationalize at an early stage and those that become internationalized at a later stage tend to depict the same behavior in their international path.

More importantly, the international path followed by new forms of business and by traditional firms is not reflected in different degrees of innovation and competitive advantage. Considering that the new forms of companies achieve a greater post-internationalization speed than that of traditional businesses, we would expect that this also takes place concerning the speed at which they commit resources abroad. However, this did not take place. All forms of companies have the same speed at which they commit their resources. This result may be due to the fact that the companies under study are part of a highly internationally-oriented sector, consequently, the transfer of resources is a natural event inherent in all forms of business.

The new forms of companies tend to operate in global niche markets that are scattered across multiple markets, while traditional companies take longer to internationalize. As for the degree of internationalization, there were also no differences between the two forms of companies. This is in line with the speed at which they commit their resources abroad, thus, it is not surprising that there are no differences between companies.

According to the theory of INVs, the new forms of enterprises have a very dynamic structure, as they are proactive, seek to exploit market opportunities, are more flexible in adapting to the demands of global markets while traditional firms are more reactive, have more opportunistic behavior and have a more rigid structure. Given the results, in the metalworking sector, there are no particular differences between companies that take longer to internationalize and those that are faster in terms of competitiveness and innovation, which may raise some questions regarding the theory of *International New Ventures*. In this sector, in particular, the traditional companies and the new forms of companies have very similar international behavior. This may be related to the environment in which companies are located. According to Johanson et al. (1988), the level of internationalization of the company depends on the direct relationship of the company with other companies (micro-positioning) and the dynamics existing within the whole network where it is inserted (macro-positioning). Thus, it justifies the behavior of new forms of companies as they tend to follow the behavior within the existing network.

The first limitation of this study relates to the fact that it has addressed only one specific sector of the Portuguese economy, and therefore, the results are not generalizable to the various sectors of the economy. However, on the other hand, we analyze companies that are subject to the same background, thus obtaining more robust results. It may be interesting to replicate this study by extending it to several sectors or, on the other hand, to analyze the metalworking sector across a larger number of countries. The other limitation is related to the dimensions considered (only two). Other criteria may be used for the internationalization process, which may lead to different results. Finally, it may also be interesting to introduce new variables to the study, such as a company's financial performance, a topic that is of great interest to corporate managers.

Abstract. *The starting points of our paper are represented by: a) our long and numerous contacts with organization management consultants and researches in Romania and other countries which have revealed quite a few limits of the present management theory and practice and its incapacity to fully valorize the new opportunities and challenges provided by the transition to the knowledge-based economy and society; b) our review and analysis of the numerous studies published by renown reviews and publishing houses which emphasized the increasing difficulties faced by the management in all types of organizations and the necessity to reinvent it. The paper main objective is to demonstrate the necessity and the possibility of the new type of the company management – stakeholders based management - instead of the classical management based on shareholder - manager - executant relationships. In order to achieve this objective, the study is structured in three main parts. The first part contains the demonstration of the necessity of the stakeholders based management, in the present period, using three categories of arguments - organizational, managerial and societal. Among the managerial arguments we mention: awareness of the existence of a comprehensive network of the stakeholders inside and outside organization; management of organization is based on the absolute primacy of the owner/ or shareholders' interests; potential of a large part of the companies endogen stakeholders (executants, managers) is used only to a small extent; traditional managerial relationship, manager-subordinate is not performing enough in the majority of the organizations; potential of the most part of companies exogenous stakeholders (clients, suppliers, investors, etc.) is frequently ignored or used only to a small degree; conceptualization, based on the stakeholders theory, of the firm as a „multipurpose entity”. The second part of the paper deals with the possibility to focus the management on the endogen and exogenous stakeholders. In order to demonstrate this, 26 arguments are structured on three levels – organizational, managerial and societal. The final conclusion of the study is that the organization stakeholders based management could and should represents the new type of the management in the company. This means new managerial strategy, system, mechanism, processes, culture and performance. Stakeholders based management is able to deal and solve much better and competitively the complex problems faced by companies during the transition to the knowledge-based economy and society, under the comprehensive impact of the present digital revolution.*

Keywords: *stakeholders; stakeholders based management; knowledge-based economy; management challenges.*

Introduction

We are living now in times of knowledge revolution, which determines the transition to the knowledge-based economy and knowledge-based society. The contemporary environment is characterized by VUCA – volatility, uncertainty, complexity, and ambiguity (Bennett & Lemoine, 2014). Never before, in the long history of mankind, the society and the economy have faced such environment. Every component of the economy and society is affected by these processes. Every component of the economy and society in order to survive, to be able to work and to be sustainable should make major changes in the processes. In the last years becomes very visible and influent digital revolution, which is a major component of the knowledge revolution. Digitization, digitalization, and digital transformation are three major processes which generate substantial changes in the volume, variety, speed and efficiency of the work processes. Economy and society are facing new demands, challenges, threats and opportunities, structures, mechanisms, and performances. Every component of the economy and society needs a new management able to elaborate strategies and policies, to create activities, structures, and systems, to make and implement decisions, actions and behaviors generating functionality and competitiveness.

In order to achieve such essential mutations, mandatory for organizations, the management should change deeply itself. If we look at what happened in the last decades, both in management practice and theory, we could see a lot of improvements, a lot of innovations, a lot of performances. Meantime we could see also numerous unsolved managerial problems, many questions without efficient answers, many organizations – some of them very large and powerful – which not survive, which disappeared in only a few years. The many and the substantial managerial advances occurred, especially in the developed countries, there were not able to solve performant a large part of the societal, organizational and individual requirements and challenges. The famous „Renegade Brigade” involving 136 of leading management professors, consultants and managers from the USA, Europe and Canada, in the Manifesto published by Harvard Business Review has concluded that the management should be reinvented. They have formulated a set of 25 challenges that should be taken into consideration in this very difficult undertaking.

In our paper, we try to find an answer to a large part of these challenges, and we outline a new innovative approach to these managerial relationships. We propose to enlarge and to change the nature of the management relationships. Traditionally, from the ancient times, the management is dealing mainly with the relationships manager – executant, based on the hierarchical authority and competences. We consider that the managerial relationships should be focused on the all relevant stakeholders involved in each organization. The managerial relationship with relevant stakeholders – executants, suppliers, bankers, designers, and of course shareholders and managers – should be based on the win-win approach in order to fully motivate and engage their information, knowledge and all other types of their resources. This means a radically new type of management. Based on the comprehensive review and analysis of the management literature we have identified two categories of arguments regarding stakeholders based management. The first category supports the statement that the management focused on the stakeholders it is necessary now, in order to replace the traditional management based on the relationship manager - executants. The second category of arguments

demonstrates that such management is possible now, taken into consideration the characteristics and the mutations at the societal, organizational and managerial level.

In our opinion, the radical change to the stakeholders based management could solve many of the present management deficiencies and concomitantly to generate new managerial capabilities in accordance with the content and the requirements of the new type of society and economy- based on knowledge. Stakeholders based management is much better equipped than the present management in order to valorize the opportunities created by digitization, digitalization and digital transformation and to overcome the many present deficiencies.

Why is necessary the stakeholders based management system now, in the present period?

Organizational arguments

- *Perception and understanding of organizations - of course including companies* - as the social constructions. This means that they are artifacts created by human beings to serve their ends. They follow processes that are shaped by human purposes, and they do not exist independently of human minds and actions. Organizations are systems of human actions in which means and ends are guided by the intentions, strategies and hoped-for incomes. They are in effect created by meaning, with a rich tapestry of cultural rules, roles, and intentions (Coghlan, 2016, p.7);

- *Development of a new type of company focused on knowledge* is characterized by resources, operations, and functionality which are quite a different comparative with the classical capitalist company; it is named knowledge-based company;

- *Companies contextualization by amplification of the extern environment influence* on their objectives, resources, activities, functionality, performance and sustainability, in the conditions of the multiplication and the acceleration of the companies inputs and outputs;

- Intellectual capital plays a decisive role in the survival, functioning, and development of modern companies, based on knowledge;

- *The resources of a large part of the companies* have changed deeply during the last decades through:

- the appearance of two new categories of resources - information and knowledge;
- the components, the structure and the functionality of "classical" resources - human, technical-material and financial - has substantially changed;
- the human resource, very closely associated with information resources and knowledge resources, has a major role in the modern organizations, much higher than in classical companies.

- *Companies activities have heavily changed during the last decades* through:

- the formation of the consistent activities focused on the creation, purchasing, use, share, valorization a.s.o. of the knowledge; all these operations constitute the content of the new company function – knowledge function; this function is a transversal company

function, different from vertical functions-research - development, commercial, production, finance-accounting and from classical company;

- the content and dynamics of classical activities (supply, production, sales, accounting, finance, etc.) also have changed deeply;

- human resources training, because of their size and major impact within the organization, become gradually - especially in the large and middle companies - a distinct company function fulfilled partially by externalization outside them.

- *Modern companies based on knowledge, is quadro-dimensional*, trying to achieve concomitantly four types of objectives:

- economical;

- social;

- ecological;

- educational.

- *The knowledge-based company represents an ecosystem presenting the following features:*

- the system made up of interactive parts which act together;

- multidimensional community - human, economic and ecological;

- networking endogen complex;

- system interconnected with other exogenous systems and with its environment.

- *The background of the performance and the sustainability of the knowledge-based company is represented by the sustainability diamond based on knowledge*, as we can see in figure 1 (Nicolescu & Nicolescu, 2017);

- *The manifestation of the new organizational paradox discovered by Gary Hamel* "The organization should become more adaptable, innovative and inspirational, without being less focused and disciplined or less oriented on performance" (Hamel, 2009);

- *Awareness of the fact that the success of a firm is determined by its ability to establish and maintain relationships within the entire stakeholder network* (Post, Preston & Sachs, 2002, p.96);

- *Companies reinvention* taking into consideration the multiple changes and challenges occurred at mondo, macro, and microsystems. Recently, in a study published in MIT Sloan Management Review has outlined: "It is no longer about how companies should thrive, but rather how they must reinvent themselves to survive because that's the key issue today" (Weill & Woerner, 2017).

Managerial arguments

- *Awareness of the existence of a comprehensive network of the stakeholders - inside and outside the companies* - who have a major impact on their functionality, performance, and sustainability;

- *Traditional management, still predominant in the most part of the companies, is based on the absolute primacy of the owner and/or shareholders interests*, the necessities and expectations of the other stakeholders, being ignored or only sporadically taken into consideration. A partial exception from this refers sometimes to the companies' top managers;

Figure 1. Sustainability diamond

- *Potential of a large part of the companies endogen stakeholders* - managers and especially executives - is used for the sustainable organization development only to a small extent;

- *The traditional managerial relationship, manager – subordinate*, involving two of the most numerous and important company stakeholders, which is based on hierarchy and on the "strong" authority of the manager, is not performing enough in the majority of organizations. As consequence, in companies have been developed new managerial elements based on participation, flexibility, collaboration, strategic agility, which could solve only partially this problem;

- *Potential of most part of companies exogenous stakeholders* - clients, suppliers, investors, bankers, consultants, a.s.o. - is frequently ignored or used only to a small part. Because of this situation, these stakeholders do not contribute enough to the generation of the company value added and to obtain a competitive advantage;

- *The ascertainment by many reputable specialists of the necessity to elaborate and to practice a new type of management*, radically different comparative with the management predominantly in the present – the management focused on stakeholders. This idea was very well formulated by the renowned Professor Eduard Freeman in the foreword of the book "Unfolding Stakeholder Thinking: Theory Responsibility and Engagement" - The need for a new era of management thinking and theory: one based on the idea of stakeholders. We need to rewrite management theory and practice!" (Andriof, et al., 2002, p.89);

- *Conceptualization based on the stakeholder theory of the firm as a "multi-purpose entity"* (Crane, et al., 2014). This reconceptualization "opens" the door for "de facto" integration of the stakeholders in the company strategy, functioning and performance.

Societal arguments

- The discovery by Harvard University mathematical biologist Martin Nowak in 2006 that "*natural cooperation*" as the *third fundamental principle of evolution* beside of mutation and natural selection (Nowak, 2006);

- *Human beings "are more cooperative and less selfish than most people believe*. Organizations should help us embrace our collaborative sentiments" (Benkler, 2011);

- *Societal requirements* formulated by prestigious specialists based on the valuable studies "*we should re-frame capitalism in the terms of stakeholders' theory* so that we come to see business as creating value for the stakeholders" (Freeman, et al., 2010, p.211);

- *Transition* in the national and international economy, from the competition between companies to *competition between networks of companies stakeholders*. We "have competing networks of stakeholders, where one competing network is in competition with other networks" as can be seen from the next figure. As consequence all relevant companies stakeholders should be integrated into networks able to compete successfully on the local, regional, national and international markets and environments;

Figure 2. Competing stakeholder networks

We mention that the overlapping ovals are an indication that competitors are likely to share some of the same customers and suppliers. We acknowledge that overlaps may also occur with other types of stakeholders as well (Freeman, et al., 2010, p.117).

Why is possible stakeholders based management now, in the current period?

Organizational arguments

- *Manifestation in the companies of the very strong modernization tendency of the resources, activities, and functionality, many companies becoming and acting as ecosystems able and open to the intensive innovation and change;*
- *Transformation of the increasing proportion of the companies in the knowledge-based organizations, which detain the necessary vision and resources - especially the knowledge and information - in order to remodel them according to the new challenges, necessities, and opportunities;*
- *Transformation of the large percentage of the companies into learning organizations, amplifying substantially companies and their managers and executives capacity to innovate and to remodel themselves;*
- *Fast digitization of the companies and business environment, which enhances and accelerates the organization and people access to the knowledge and information, the communication and the consultation with the companies stakeholders, internal and external, actual and potential;*
- *Amplification on the information and knowledge detained, shared and used by the companies and their components, and of the other stakeholders;*

- *Proliferation* at the level of companies of the approaches focused on the sustainability and corporate social responsibility, which make them more open and proactive to their stakeholders.

Managerial arguments

- *The deep transformation of the in management practices in numerous companies - corporations and large companies in the pole position - being on quasi-continuous innovation and change;*

- *The appearance in quite many companies of the new managerial dimensions - provisional, innovational, flexible, motivational, methodological, informational, formative, participative, systemic and international - but still not enough used and valorized by them;*

- *Seizing, taking into consideration and valorizing to a large extent by the numerous companies managers of the huge potential of the new organization resources - information, knowledge - and intellectual capital;*

- *Awareness of a large number of managers of the company many categories of stakeholders existence major impact on it and their clients, suppliers, managers, executors, shareholders, investors, a.s.o.;*

- *Development in numerous companies of the specific and effective managerial mechanisms for certain important stakeholder categories, which has proved the possibility, the usefulness, and high capacity to produce a performance of such managerial mechanisms. The largest used and performant such mechanism there are the Customer Relationship Management (CRM) and Supply Chain Management (SCM);*

- *Development under environmental challenges and demands for certain stakeholder categories (local communities, company employees, for example) of the specific managerial approaches with human and ecological dimensions like Corporate Social Responsibility (CSR);*

- *The recent formulation of the thesis that the combination of the focus on management process with the stakes of companies stakeholders, could represent to the present necessities and realities an alternative solution for obtaining sustainability (Sadun, Bloom & Reenen, 2017);*

- *Remodel of the organization and employees culture, placing emphasis on the novelty, creativity, change, flexibility, participation, and adaptability;*

- *Manifestation, because of the mutations on the company environment, associated with the transition to the knowledge-based economy and society - both in management science and practice - of the numerous innovative ideas and approaches, continue amplified and diversified in order to increase company performance and sustainability;*

- *Identification of the necessity to radically remodel the organization management by the great number of renowned management scientists and top managers from prestigious companies and the formulation by them of appeals and urges in this respect. Among*

them, we mention "*Renegade Brigade*" published by Harvard Business Review in 2009, and the strategic document adopted at the Davos Forum in 2017, called "*The Compact for Responsive and Responsible Leadership - A Roadmap for Sustainable Long-Term Growth and Opportunity*". (World Economic Forum Annual Meeting, 2017);

In *Renegade Brigade Manifesto* (Hammel, 2009), 136 of leading professors, consultants and managers from USA, Europe, and Canada have concluded that „the modern management“ (management 1.0) of which dates back to the late nineteenth century, has reached the limits of improvement. They have laid out a roadmap for reinventing management proposing to construct management 2.0 taking into consideration 25 management's grand challenges (see the table 1):

Table 1. Management's grand challenges

1.	<i>Ensure that the work of management serves a higher purpose.</i> Management, both in theory and practice, must orient itself to the achievement of noble, socially significant goals.
2.	<i>Fully embed the ideas of community and citizenship in management systems.</i> There's a need for processes and practices that reflect the interdependence of all stakeholder groups.
3.	<i>Reconstruct management's philosophical foundations.</i> To build organizations that are more than merely efficient, we will need to draw lessons from such fields as biology, political science, and theology
4.	<i>Eliminate the pathologies of formal hierarchy.</i> There are advantages to natural hierarchies, where power flows up from the bottom and leaders emerge instead of being appointed.
5.	<i>Reduce fear and increase trust.</i> Mistrust and fear are toxic to innovation and engagement and must be wrung out of tomorrow's management systems.
6.	<i>Reinvent the means of control.</i> To transcend the discipline-versus-freedom trade-off, control systems will have to encourage control from within rather than constraints from without.
7.	<i>Redefine the work of leadership.</i> The notion of the leader as a heroic decision maker is untenable. Leaders must be recast as social-systems architects who enable innovation and collaboration.
8.	<i>Expand and exploit diversity.</i> We must create a management system that values diversity, disagreement, and divergence as much as conformance, consensus, and cohesion.
9.	<i>Reinvent strategy making as an emergent process.</i> In a turbulent world, strategy making must reflect the biological principles of variety, selection, and retention
10.	<i>De-structure and disaggregate the organization.</i> To become more adaptable and innovative, large entities must be disaggregated into smaller, more malleable units.
11.	<i>Dramatically reduce the pull of the past.</i> Existing management systems often mindlessly reinforce the status quo. In the future, they must facilitate innovation and change.
12.	<i>Share the work of setting direction.</i> To engender commitment, the responsibility for goal setting must be distributed through a process in which the share of voice is a function of insight, not power.

13.	<i>Develop holistic performance measures.</i> Existing performance metrics must be recast since they give inadequate attention to the critical human capabilities that drive success in the creative economy.
14.	<i>Stretch executive time frames and perspectives.</i> We need to discover alternatives to compensation and reward systems that encourage managers to sacrifice long-term goals for short-term gains.
15.	<i>Create a democracy of information.</i> Companies need information systems that equip every employee to act in the interests of the entire enterprise
16.	<i>Empower the renegades and disarm the reactionaries.</i> Management systems must give more power to employees whose emotional equity is invested in the future rather than the past.
17.	<i>Expand the scope of employee autonomy.</i> Management systems must be redesigned to facilitate grassroots initiatives and local experimentation
18.	<i>Create internal markets for ideas, talent, and resources.</i> Markets are better than hierarchies at allocating resources, and companies' resource allocation processes need to reflect this fact.
19.	<i>Depoliticize decision making.</i> Decision processes must be free of positional biases and should exploit the collective wisdom of the entire organization and beyond
20.	<i>Better optimize trade-offs.</i> Management systems tend to force either-or choices. What's needed are hybrid systems that subtly optimize key trade-offs.
21.	<i>Further, unleash human imagination.</i> Much is known about what engenders human creativity. This knowledge must be better applied in the design of management systems.
22.	<i>Enable communities of passion.</i> To maximize employee engagement, management systems must facilitate the formation of self-defining communities of passion.
23.	<i>Retool management for an open world.</i> Value-creating networks often transcend the firm's boundaries and can render traditional power-based management tools ineffective. New management tools are needed for building and shaping complex ecosystems.
24.	<i>Humanize the language and practice of business.</i> Tomorrow's management systems must give as much credence to such timeless human ideals as beauty, justice, and community as they do to the traditional goals of efficiency, advantage, and profit.
25.	<i>Retrain managerial minds.</i> Managers' deductive and analytical skills must be complemented by conceptual and systems-thinking skills.

"The Compact for Responsive and Responsible Leadership - A Roadmap for Sustainable Long-Term Growth and Opportunity", has been elaborated by 100 leading business and finally adopted by all participants in Davos Forum 2017. According to this document, there is a need for a Compact that recalibrates the relationship between public corporations and their major investors, and conceives of corporate governance as a collaboration among corporations, shareholders and other stakeholders working together to achieve long-term value and resist short-termism. Disagreement between stakeholders is best resolved in a transparent and respectful manner, de-escalating conflictual stances wherever possible. Each manager participant as a responsive and responsible leader has undersigned and commit to acting within the remit of his/ her responsibilities, duties and influence to promote meaningful engagement between the

board, investors and other stakeholders that builds mutual trust and effective stewardship, and promotes the highest possible standards of corporate conduct and to implement policies and practices within the organization that drive transformation towards the adherence to long-term strategies and sustainable growth for the benefit of all stakeholders.

- *Enhancement of the managers' professionalization tendency*, who because of the high knowledge level and of the vision focused on change, innovation, and participation, are able to initiate and practice a new management type in the relationships with the companies' stakeholders, valorizing their large potential in a win-win approach.

Societal arguments

This category of arguments is represented by the *tendencies in the organization environment* which enable and make possible the implementation of the stakeholders based management, we just enumerate them in the figure 3. (Nicolescu & Nicolescu, 2017).

Figure 3. The main tendencies in the organization changing the business environment

Some of these tendencies there are very complex, influencing not only the possibility of the company management to focus on the stakeholders, but also to the necessity to do this in order to survive and be sustainable.

Conclusions

In our opinion, the logical answer to all elements presented in this paper is the transition to the new managerial vision and to stakeholders based management. Such revolutionary mutation involves deep and complex changes in all major company management components:

- company strategy
- entire organization management system
- decisional management subsystem
- methodological management subsystem
- organizational management subsystem
- informational management subsystem
- human resources management subsystem
- organizational culture
- company organizational behavior
- company performance and sustainability.

Company stakeholders based management shall be more performant comparative with the predominantly management of companies at present, because it shall be able to use the resources and the potential of their endogen and exogen relevant company stakeholders: managers, executives, shareholders (owners) clients, suppliers, investors, bankers, local community, a.s.o. It shall be focused on the knowledge - the main company raw material, production, means, product capital and competitive advantage in the knowledge-based economy (Nicolescu & Nicolescu, 2011). The use and valorization of the intellectual capital of the relevant stakeholders shall be in the center of all managerial processes and relationships, generating the quadridimensional sustainable performances – economic, social, ecological and educational (see figure 1).

Transition to the stakeholders based management depends decisively on the managers. They should be the first to remodel the vision, mentality, approach, decisions, actions, and behavior. The implication of all relevant stakeholders in management practice and theory is absolutely necessary. RSMS - Romanian Scientific Management Society - could and should play a major role in the transition toward organization stakeholders based management.

Abstract. *The aim of the article is to present how and with what consequences the dynamic development of Information and Communication Technologies (ICT) affects the transformation of the work of contemporary managers. In accomplishing this goal, the essence and explanation of the specificity of the managerial profession were presented to confront traditional expectations addressed to managers with expectations resulting from the development of the digital economy. ICT was presented as General Purpose Technologies (GPT), which led to the third technological revolution. Next, new ICT solutions are synthetically presented, which currently have a particularly strong impact on the work of managers, their decisions and the strategies and management methods they adopt. The main attention was paid to such solutions as mobile and wireless technologies, Big Data, Cloud Computing, Internet of Things and 3D printing technology. The importance of ICT power resulting from their range and universality of the application was also emphasized and it was also indicated that such solutions as artificial intelligence, supercomputer, autonomous cars, robots, bitcoins and blockchains and neurotechnologies are also interesting. Next, an attempt was made to explain how the expectations addressed to contemporary managers change. It was pointed out that currently, managers need to revise the existing, traditional management methods. At the same time, new approaches to management should apply to virtually all dimensions of their activity and responsibility. Fundamental changes should include, among others, organization strategy, shaping organizational structures, human resources management practices, marketing, managing people and managing teams. As a consequence, managers should be able to implement new business models. As it results from the analysis, the managers' approach to the tasks they fulfill should change fundamentally. In the conditions of the digital economy, they should be ready to give up some of their power and link the organization's success with work within flattened organizational structures. In a new way, they also have to approach the implementation of organizational leadership and team management. The paper is an attempt to implement the prognostic goals of management theory and practice. It is based on a critical analysis of available, very extensive literature on the subject in the area covered by the topic. It also used the analysis of statistical data on ICT development and the results of querying reports and thematic studies of well-known consulting companies. Also included are business case studies published in reputable business journals, which particularly use ICT effectively.*

Keywords: *management; manager; Information and Communication Technologies; digital economy; e-manager; managerial challenges.*

Introduction

Managers are an extremely numerous group of specialists, occupying various managerial positions (Barabel & Meier, 2010, pp.147-250), in various types of organizations (Thiétart et al., 2007, p.1), both business and administrative, and even non-profit organizations. The nature of their work, related to management, makes them constantly confronted with new challenges. At present, Information and Communication Technologies (ICT) and the more general nature, i.e. the functioning of the organization within the so-called digital economy. Challenges appearing before managers are not only related to ICT solutions implemented in a given organization, but also result from changes in competitors, cooperating entities and, above all, clients. The lack of adequate response to market changes and the failure to take advantage of the opportunities associated with the opportunities offered by ICT may, in fact, lead to the deterioration of the competitive position of the organization, and finally to its disaster in today's extremely demanding market.

In connection with the above, the paper attempts to present how and with what consequences the dynamic development of Information and Communication Technologies (ICT) affects the transformation of the work of contemporary managers. Based on a critical analysis of extensive literature, the analysis of statistical data on the development of individual ICT elements, review of consultancy companies' reports and case studies of companies using advanced ICT, traditional expectations addressed to managers were anticipated with expectations resulting from operating in the conditions of the digital economy. Suggestions were also given on how managers should modify their management approaches.

The essence and specifics of the work of managers - a literature review

Generally speaking, the managerial profession from other professions is distinguished primarily by the fact of direct involvement in matters related to the management of organizations. It is managers who start processes related to the functioning of the organization, participate in their implementation, observe their course, introduce (or not) adjustments, control individual activities or participants of given processes, shape relations with stakeholders and the environment. Thus, managerial professions distinguish not only the positions they occupy but also the specificity of their position and completed tasks. Moreover, managerial phenomena are characterized by such imprecise nature of work, the authority they have over people and organization resources, responsibility for themselves and others, concentration on problem solving, special type of activity inside and outside the organization, creating goals, attention to results, necessity initiating pro-development activities and responsibility for management processes.

Managers are in particular professionals responsible for the entire organization or its separate part. They perform their tasks through people who are subject to them or other people who do not have to be their subordinates (Mintzberg, 2011).

It seems that managers can be assumed to be *employees of organizations who, because of their position, define the framework and principles of functioning of teams, cells or entire structures, and through significant participation in the disposal of resources and*

management of people are responsible for setting and achieving the goals of the organization or part of it.

Inspired by the concept of H. Fayol (Mintzberg, 1990, pp.24-25), traditional approach to the work of managers was presented for example by L. Gulick in the classification of the POSDCORB acronym, i.e. Planning, Organizing, Staffing, Directing, Coordinating, Reporting, Budgeting (Martinet & Pesqueux, 2013, pp.9-10). P.F. Drucker saw this issue sooner a little bit differently and distinguished five basic operations carried out by managers, namely: setting goals, organizing, motivating and informing, measuring performance and developing people (Drucker, 2006). For some time, these classifications have been simplified and it is usually assumed that managers are responsible for the implementation of functions: planning, organizing, managing people and controlling (Schermerhorn, 2004).

The above approaches to the work of managers have been questioned (or, as some people prefer - developed) H. Mintzberg in the authorial concept of managerial roles (Barabel & Meier, 2010, p.179). He distinguished 10 roles, which he divided into three groups. He included the following roles for the interpersonal group: representative (symbol), leader and connector. In the information group, he distinguished the roles: active observer, relay, and connector, while in the decision group he indicated the roles: entrepreneur, regulator, resource manager and negotiator (Mintzberg, 1984). The authors of the work titled "Becoming a Master Manager" have distinguished eight managerial leadership functions. These are the functions: mentor, moderator, monitoring, coordinator, director, implementer, intermediary and innovator (Quinn et al., 2003). The classifications presented here do not exhaust the diversity of managers' job approaches but seem to suggest enough how it can be heterogeneously perceived, and how this perception has changed over the last decades.

It should also be added that in practice the matter is additionally complicated, which can be exemplified by the analyses of the work of managers such as: L. Gerstner (IBM) (Slater, 1999) or S. Jobs (Apple) (Isaacson, 2011), presentations of his own management approach to J. Welch (General Electric) (Welch & Welch, 2005) or A. Morita (Sony) (Morita, Reingold & Shimomura, 1986), as well as extensive research on the work of managers carried out by The Gallup Organization or H. Simon's research on the management of small and medium-sized companies. The analysis of various sources leads to the conclusion that the implementation of managerial functions largely depends on the personality of managers, their views on management, and also that it is strongly culturally determined.

Management, which is the subject of managerial activities, is a social technology with a very rich history. But since the first scientific concepts on this subject came into being, almost everything has changed. There are other markets and competition, there are completely new legal regulations, organizations operate in other structural arrangements, and managers are confronted with more and more challenges (Gonciarski, 2012). However, as R. Norman aptly notes, as in the times of the industrial revolution, technology is the driving force behind change. With the fact that this time, it is digital technology (Norman, 2012, p.35).

Information and communication technologies as general purpose technologies

The analysis of the relationship between the development of technology and management allows distinguishing technologies that have such a powerful impact that they have changed the course of civilization development. In the literature on the subject, these phenomena are often referred to as a revolution, in the sense of sudden and radical changes, and the consequences of which concern economic and social systems and lead to the formation of new management concepts.

In socio-economic analyzes the technologies that trigger revolutionary changes are referred to as General Purpose Technologies - GPT. Consequently, technologies included in this category can also be analyzed from the perspective of their impact on management, including the work of managers.

In general, GPT is a set of core technologies that are critical in generating and spreading incremental and radical innovations in various fields, sectors and economic sectors, and affect social and economic systems. They are technological innovations so powerful that they disrupt and accelerate the normal rhythm of economic development (Brynjolfson & McAfee, 2015a, p.29). Therefore, as GPT develops, it will spread throughout the economy, lead to overall productivity gains, and from the point of view of management change the rules of functioning of markets and organizations (Brynjolfson & McAfee, 2015b, p.15).

It is usually assumed that the first major breakthrough under the influence of GPT took place at the end of the 18th century (the first industrial revolution). His driving force was the invention of a steam engine and the development of railways. The next major changes occurred due to the second technological revolution, whose driving forces were electricity, a mobile technological line and mass production (Schwab, 2017, p.18).

Another major breakthrough, referred to as the third technological revolution, took place due to the development of technologies related to Information and Communication Technologies – ICT (Jarosson, 2009, pp.43-46). This term is understood as a broad set of techniques and technologies, which mainly consist of devices and applications related to the flow of information. The ICT conceptual scope includes, above all, co-existing techniques related to microelectronics, data processing (hardware and software), ICT and a variety of communication media, in particular, the Internet, wireless networks, Bluetooth networks as well as cellular and satellite networks. The term 'ICT' used in the analyzes hides in itself various types of techniques and technologies that, taken together, meet the criteria for being included in GPT.

It can be assumed that since the beginning of the 1970s ICT has started to meet the basic GPT criteria (Brynjolfson & McAfee, 2015, pp.107-108), which are according to B. Jovanovic and P.L. Rousseau: ubiquity, the ability to constantly improve and the ability to create new innovations (Jovanovic & Rousseau, 2005, pp.1181-1224). They also fulfill the additional condition defined by Wright, namely the ability to exert a significant influence on many economic sectors (Wright, 2000). This is confirmed by in-depth studies in which the impact of ICT on the economy was analyzed and which showed that it was unambiguously positive. Of course, these positive results were not only generated by ICT but were generated by transforming business entities, innovative business models and generally a new management approach implemented by managers. It should

be noted that ICT is changing at a dizzying pace and in addition, significantly changes the rules of competition and generate radically new customer expectations (Danneels, 2004, pp.246-258). These technologies are therefore a challenge for both engineers and managers.

It should be emphasized at this point that there are currently classifications distinguishing the fourth technological revolution (Skilton & Hovsepian, 2017). The authors of this paper believe, however, that it is too early to make such distinctions. Technologies that are treated as discriminants are in ICT, difficult to separate from others, and moreover, do not seem to meet GPT criteria by themselves.

ICT determining the work of contemporary managers

ICT - since the first computers - has undergone a far-reaching transformation over the last few decades. Particularly many new opportunities arose at the beginning of the 21st century when the Internet from Web 1.0 was transformed into a Web 2.0 version (Fayon & Tartar, 2014; Gonciarski, 2010; Świątkowski, 2015). As aptly noted by M.R. Dugage this new version is a kind of innovation platform that creates the conditions to reveal the real potential of the network (Dugage, 2008, pp.74-45). Apart from technological aspects, one should notice three extremely useful features of this new version of the Internet (Scheid, Vaillant & de Montaigu, 2012, p.28), namely:

1. The ability to facilitate and share any content at any time.
2. Making the Internet user from the passive content recipient an active network user.
3. The ability to create communities, connect to existing ones and initiate relationships with other users.

In the first and second decade of the 21st century, new solutions and technologies appeared that significantly modify the functioning of the organization, and thus the work of managers. In particular, it should be distinguished:

1. Increase in the popularity of mobile and wireless technologies that allow the use of digital technologies in any place and time, in professional and private life.
2. Big Data, which allows the analysis of unstructured, partially structured and structured huge data streams flowing through different channels, both from the inside of the organization and from its environment (Germain, 2014, p.37). As proven by research, this technology gives the opportunity to raise performance and profitability ratios by approx. 6% above the results of companies that do not use this solution (Barton & Court, 2013, p.62). In addition, Big Data has the potential to release enormous value, create new winners and losers (Mayer-Schönberger & Cukier, 2014, p.251).
3. Cloud computing, that is, storage and processing of data in the so-called digital clouds. It is a solution that reduces the costs for IT, paying for the actual use of resources, enabling access to solutions that are not offered as standard and greater data security (Mateos & Rosenberg, 2011, p.260).
4. Internet of Things- IoT is a network of interconnected devices that communicate themselves and acquire data. Then - with the help of appropriate systems - these data are analyzed, leading to conclusions and automated actions. This guarantees organizations that use IoT solutions achieve the expected business benefits (Choroś, 2015, p.4; Witkowski, 2017). Cisco introduced the term Internet of Everything (IoE), which is now treated as equivalent to IoT. At the same time, the IoE system is created not only by things, but also by processes, data, people, and even animals or

atmospheric phenomena, because everything can be treated as variables. Many experts say that IoT will soon overtake the Internet of people in its present shape in terms of size, significance and generated revenues (Miller, 2016, p.29). According to the World Economic Forum report published in 2015 (Deep Shift ... Survey Report, 2015), the critical size of IoT development is to connect 1 billion sensors to the network, which will probably be achieved in 2025.

5. The 3D printing technology consists in the fact that the digitally designed model is reproduced in a special printer as a physical object through layered, gradual application of molten plastic, molten metal or other raw material. The use of this type of production revolutionizes traditional production methods and causes that the possibility of production is not limited by space, and both corporations and prosumers can benefit from it (Rifkin, 2016, pp.101-105). As argued by R. D'Aveni (2013, pp.55-65), spatial printing technology has already gone far beyond the prototype phase.

From the point of view of management, the strength of digital technologies results from their range and universality of the application on a global scale. All this is now strengthened by such solutions as interactive websites, blogs, and microblogs, social networking sites, wikis, instant messaging, etc. In practice, this means - for both companies and customers - the possibility of a continuous presence in networks and their implementation professional and private tasks.

Volumetric constraints of this article make it impossible to even characterize other new ICT solutions. It should be pointed out, however, that such solutions as artificial intelligence, supercomputers, autonomous cars, robots, bitcoins and blockchains, neurotechnologies are noteworthy. All of this, taken together, creates a synergic arrangement that creates the basis for new management paradigms, which puts managers ahead of new challenges. Under these circumstances, at the end of the second decade of the 21st century, managers must make a significant return on management.

Managers against challenges posed by the ITC

Managers in the twenty-first century are confronted with all kinds of new phenomena, sometimes so surprising that they fall into the category of so-called Black Swans described by N. Taleb (2007, 2012). In this part of the article, however, only some consequences will be indicated - determining the work of managers - resulting from the spread of ICT in areas related to the management of organizations.

The most general consequence of the spread of ICT is the transformation of the traditional market into a version known as e-business and e-commerce extracted from it (Chaffey, 2014). The new economic system created in this way by M. Volle defines the interesting neologism "Iconomie" (Greek: eikon - image and nomos - organization). The term means "(...) a society whose economy, institutions and ways of life are based on the synergy of microelectronics, software and the Internet" (Volle, 2013, p.11). Others describe this new type of economy as the electronic economy, network economy (Benkler, 2008), Macrowikinomics (Tapscot & Williams, 2011), e-economy, information economy, Economy 2.0 (Jarrosson, 2009) or the digital economy (Gonciarski, 2013). Recognizing the differences between these terms, it seems that for general considerations they can be treated as synonyms.

Operating in these new conditions means for managers the need to revise traditional strategies and management methods. The power of the digital market is demonstrated by the data presented in the report from January 2018 (We are a social agency, report, 2018). It shows that currently, over 4 billion people around the world use the Internet. Which means that more than half of the world's population is now connected to the network, and more than a quarter of a billion new users arrived in 2017. The number of users of social networks in 2018 is 3.196 billion, an increase of 13% year on year, and the number of mobile users increased by 4% and is 5.135 billion.

Necessarily, managers become so-called digital managers who are expected to have skills related to the use of ICT and know how to apply digital management techniques in practice to increase the efficiency of their teams and thus increase the efficiency of the entire organization (Zara, 2016). This requires the implementation of often fundamental changes regarding company strategy, market positioning, customer relationship management, the transformation of structures, implementation of new procedures for formalizing activities and reporting as well as flattening the hierarchy and ensuring effective control over communication (Boyer & Equilbey, 2013). This last issue is extremely important, because digital connections implemented in a continuous system (24h/24h) cause that the boundaries are blurred, both for companies and their leaders, managers, and employees. The boundaries between the interior and the environment of the organization disappear, as well as between professional life and private life (Reyre & Lippa, 2015, p.32).

From the manager's point of view, it is important that ICT caused radical changes in the production of goods and provision of services, including globalization of product development, an adaptation of workplaces to technology and expansion of service sectors. Increasingly, they enable digitization and virtualization of products as well as the individualization of services. They have changed the traditional relations between the state, business and consumers and create opportunities for creating a new type of services. They significantly increased the possibilities of individuals' access to information, created new forms of tracking individual behaviors and created favorable conditions for communication at a distance, facilitating the exchange of information and maintaining social relations (Souter et al., 2010, p.17).

Digital technology lets us end with the era of Taylorism through digital transformation, which concerns in particular (Delorme & Djellalil, 2015, p.11-12): business models, the scope of business and sectors, ecosystems, cooperation within the company, recruitment, marketing plans, customer relations, distribution, services, pricing mechanisms, promotional activities, gaining customer loyalty, communication and shaping brand value and reputation.

The ultimate goal of digital technology in the work environment and management is to create added value. New expectations formulated in relation to managers are connected with the need to reconcile several paradoxes (Zara, 2016, p.9):

- traditional enterprise culture with the culture that ICT introduces, based on listening, co-creation and collective intelligence;
- managerial control with the need for employee autonomy, in a very open and transparent digital environment;
- real operation with functioning in a virtual environment;
- previous skills with expected new competences.

It is also important to be aware that digital technology is an important aspect of managers' actions, but what really matters most is the management implications that this technology causes. I. Reyre and M. Lippa argue, in this context, that managers should have the following new skills (Reyre & Lippa, 2015, pp.42-46):

1. Ethical and kind behavior;
2. Conduction using teamwork;
3. Creating innovation;
4. Using collective intelligence;
5. Thinking and intercultural activities;
6. Developing recursive thinking;
7. Efficiency in the use of new media;
8. Transdisciplinary activities;
9. Make full use of the potential of all employees;
10. Organizational knowledge management;
11. Agile operation as part of virtual cooperation.

A particularly difficult field for managers in the digital age is the need for a new approach to managing people, organizing teamwork and leadership. Managing people in new organizational structures, using new ICT technologies also requires a new type of leadership. In this regard, it is worth approving of the position of H. Mintzberg, who claims that there is no reason to distinguish between managers and leaders - "instead of separating management from leadership, we should treat managers as leaders and conceive leadership as well-performed management" (Mintzberg, 2011).

Targeting in today's - created under the influence of ICT - virtual, flexible, flattened organizational structures requires a readiness to give up some of the managerial authority. Therefore, the popularity of the so-called distributed leadership, whose characteristic feature is the assumption that the leader can become any employee who is ready in a given situation and able to gather supporters around him and at the same time take responsibility for the tasks being carried out (Ciuk, 2012, p.435). However, the challenge for many managers is to limit the typical control functions for coaching or mentoring. Therefore, the basis of modern people management are partner relations based on trust, participation and effective communication (Barabel & Maier, 2010, pp.597-598). These conditions give the potential to involve colleagues in effective organizational processes.

It should be noted that ICT enables employees to perform their tasks remotely. Dispersed teams can be created in this way, which usually operate in different places - in different cities, regions or countries, and even continents. This new situation creates a number of possibilities for cooperation. The possibility of employing the best specialists, regardless of where they live, if they only have access to the Internet, seems particularly important.

Team managers are able to use new technology to keep remote workers plugged into the home team. Meeting software, instant messaging, video chats, project management software and mobile applications make it easier than ever before to stay connected. Some examples of new, modern communication technologies are given in table 1.

Table 1. Examples of IT communication tools appropriate for dispersed teams
(Own study, based on the idea of S. Sałek, 2016, and websites of individual tools)

Tool	Examples of IT tools	Ways and situations of application
Communicator	Skype, MSN, Messenger, WhatsApp	Immediate communication The need for fast, not extensive information Need of quick answer the questions
Shared services	Microsoft Exchange	Task delegating Storage of important data in one location Current list of contacts to team members and checking their availability
Remote access	Remote desk, WebEx	Sharing desk with other team members if needed
Video-conference, Teleconference	WebEx, Skype, VoIP	Possibility to discuss the project's progress and gaining its requirements Discussing the problems and finding the solutions
Traditional e-mail	Many different www. Sites	The ability to quickly transfer information and send electronic documents
Knowledge-based and company social media	Confluence, Jira, Intranet, Wiki	Informing about the events in the organization The ability to create thematic forums, sharing knowledge, solving problems and storing documents

An example of an interesting innovative solution using ITC and integrating the organization's personnel at the same time is the construction of internal inter-unit networks at Procter & Gamble (P&G). There are 30 communities in the company, which include volunteers from various parts of the group, whose task is to solve various organizational problems. These communities take part in technology summits every month along with representatives of ten business units (Hansen & Birkinshaw, 2011, p.126).

Currently, the so-called collective intelligence, which is a synergistic sum of intellectual resources of the organization. From the manager's point of view, it is associated with simultaneous building, sharing, transforming and implementing intellectual (internal and network) resources in activities (Zara, 2008, p.25).

ICT also enables such new solutions as flexible working time, employee leasing, outsourcing and offshoring of personnel functions, teleworking, e-learning, etc. New

managerial skills are also needed to manage these new employee systems (Gonciarski, 2013a, p.147).

ICT sets new expectations for managers in the area of shaping relationships with clients who, thanks to new technologies, have clearly strengthened their position and have become significant market partners. Currently, the especially innovative relationship potential can be launched thanks to the Web version of the Internet, and especially to social networks. In special situations, this leads to the creation of an innovative community-based partnership production model (Benkler, 2008, p.78). This phenomenon applies in particular to the so-called Generation Y, which becomes truly prosumer (Tapscott, 2010, p.351). In this situation, managers have to adapt the organization's structure to a new type of relationship in which stakeholders should be able to have direct, mutual contacts (Ramaswamy & Goullart, 2011, p.104). Unfortunately, management using these solutions is not easy, because they undermine current views on the role of management, especially the ability to control customer experience (Cook, 2009, p.122).

The obligation to shape new customer relationships leads managers to seek innovative solutions in the field of marketing. The reason is that marketing moves to the web and social media, both in market research and in shaping relationships, public relations, advertising and promotion. This is reflected in the concept of Marketing 2.0 (Laurent, 2008, p.209) or Digital Marketing (Scheid, Vaillant & de Montaigne, 2012). It should be emphasized, however, that regardless of associations, these are concepts that definitely go beyond online marketing and are actually more social than technological phenomena.

It should also be noted that at present some specialists are already formulating Marketing 3.0 paradigms (Kotler, Kartajaya & Setiawan, 2010, p.21 and next), and even Marketing 4.0 (Kotler, Kartajaya & Setiawan, 2017). The latter is, on the one hand, the answer to the latest ICT solutions, and on the other is extremely homocentric.

The impact of ICT on the work of managers is particularly visible in the possibility of implementing new business models that are gradually starting to displace traditional ways of running companies. Among these new business solutions, the following models deserve particular attention: models focused on the client, common infrastructure, virtual communities, net value integrators and digital content providers, co-creation, and sharing.

Conclusions

Digitization is probably one of the biggest and deepest changes that our societies have ever experienced (Delorme & Djellalil, 2015, pp.201-202). Generally, it changes the nature of work (De Saint Laurent-Kogan, pp.27-32) and makes it possible to create innovative technical and organizational solutions (Caseau, 2015, pp.17-22). It is not surprising that it causes radical changes in the functioning of the organization, and thus poses a number of challenges to managerial profession.

For decades, the task of managers was to control the structures they managed. In the digital era, however, the task of managers is not to rule, but to accompany, attend and listen. This is because the digital economy smoothes the hierarchy, "horizons" organizational arrangements, and in social networks, every employee can "take over"

and create formal activities without formal titles. As a result, the managerial profession in the 21st century refers more to the relation of expression and natural authority than to the power relations. The manager's position in the organization results in more from what he does than what is associated with the title on the business card (Rey-Millet & Rey-Millet, 2017, pp. 57-60).

Digital technologies are a difficult challenge for managers, but in the end, they allow a management revolution as a system and free the manager as a person (Rey-Millet & Rey-Millet, 2017, p. 298). The response of managers - for radically changed operating conditions - should be the creation of new organizational arrangements and the gradual implementation of a new art of management, shaped by the strength of coherent ideas built on experimental organizational and managerial innovations (Brilman & Hérard, 2011, p.47). In these circumstances, flexibility has become an obligation, a type of categorical imperative, and the conditions and means of its implementation have become elements of the current management and the coming years (Boyer & Equilbey, 2013, pp.72-73).

The management of organizations (especially virtual ones) requires a break with traditional management based on hierarchy and order, and the transition to decentralized management based on trust. In this situation, managers from supervisors should become coordinators who are responsible for creating an atmosphere that allows these new teams to function freely.

Unfortunately, the transformation of a manager into a digital manager is a real challenge, because shaped habits - anchored in procedures and traditional management principles, reinforced by many training - are not easy to change (Zara, 2016, p.122). To achieve this, managers have to go through the so-called management 2.0, which presents the new dimensions of managers' work in the digital economy in a systematic way.

Abstract. *The stable and efficient functioning of the Russian economy in the face of increasing contradictions, the struggle for resources, markets and technological leadership requires the building of the development potential of the high-tech sector. This requires a "smart" economy that produces unique knowledge, new things, and technologies that are useful to people. There are opinions that industrial enterprises currently do not have sources of competitive advantages that ensure the company's competitiveness for a long time. Other experts believe that such sources are available. They include qualified personnel, working as a cohesive team, innovation, patents and much more. The independent competitive advantage of the company is the stability of the competitive positions of the companies. In modern conditions, a particular importance is acquired by such a chain of concepts as sustainability - competitiveness - management of the enterprise's competitiveness. The level of competitiveness of industrial enterprises depends on many factors and acts as a driver of the economic development of the economic system. Low competitiveness entails: The purpose of the work is to determine the directions for increasing the competitiveness of industrial enterprises. Tasks: 1. identify the most significant factors and sources of ensuring the competitiveness of industrial enterprises; 2. to form a system of requirements and conditions necessary to ensure the competitiveness of industrial enterprises; 3. assess the level of competitiveness of high-tech industrial enterprises; 4. Development of a mechanism for managing the competitiveness of industrial enterprises. The empirical base of the research includes the reporting of industrial companies that are publicly available, reports of consulting companies, industry reviews, as well as data obtained during a questionnaire interview. The analysis used indicators such as the level of competitiveness, indicators that characterize the state and dynamics of the development of high-tech industrial enterprises. As a result of the study, the following results were obtained: 1. a combination of sources of increasing the level of competitiveness of high-tech industrial enterprises is revealed, among which key ones are: operational efficiency and strategic positioning; 2. a methodology for assessing competitiveness has been proposed and its approbation has been carried out; 3. The model of management of competitiveness of industrial enterprises is developed, on the basis of which recommendations are offered on increasing the degree of their competitiveness.*

Keywords: *industrial enterprise; competitiveness; competitive advantages; stability.*

Introduction

The development of the world economy is predetermined by various prerequisites, including the interests of states. "... China is focused on stimulating the domestic market, Germany is looking for an opportunity to protect itself from the economic decisions of its neighbors, Russia is developing import substitution programs, and the US is channeling efforts to strengthen the financial system" (Leonard, 2015). But with all the diversity considered, the key driver of promising economic development is manufacturing enterprises in the technological boundaries of the 4th industrial revolution and with a marketing focus on the domestic market. The manufacturing sector at present is "... the heart of the economic development process" (Amsden, 2003), the source of technological power of the state (Kondratyev, 2013), he "... is and will remain an important component ... of the economy" (Grunke, 2015). The reduction of this segment is a clear "sign of the economic decline of the country" (Kondratyev, 2013).

Thus, the development of manufacturing enterprises is a strategic task. Achieving such strategic objectives and in the long run, is seen through the creation of special mechanisms for the synergistic interaction of all elements existing potential. Such an important mechanism can, in our opinion, mechanism competitiveness of the organization's stability, focused on creating such intra-production conditions that will ensure the formation of sustainable competitive advantages in the long term.

The aim of the research is to find ways to increase the competitiveness of high-tech industrial enterprises.

Research methods

The study was carried out in three stages:

1. identify the most significant factors and sources of ensuring the competitiveness of industrial enterprises;
2. to assess the level of competitiveness of industrial enterprises;
3. development of competitiveness management requirements industrial enterprises.

The empirical base of the study includes the reporting of Russian industrial companies, which is in open access in the system of information disclosure by Interfax, reports of consulting companies, industry reviews, as well as data received during a questionnaire interview. In the course of the analysis, indicators such as the level of competitiveness, indicators characterizing the state and development dynamics of industrial enterprises were used. The observation period is 8 years and covers 2008-2015.

Just as the source of significant factors and conditions ensuring x competitiveness industrial enterprises involved materials of scientific and practical and analytical publications, scientific reports.

Results of the study

It makes sense to investigate the problem of the competitiveness of manufacturing enterprises only if they are in a state of competitiveness or if there are all opportunities to achieve this state in the near future. This happens as long as the characteristics of production, economic and financial activities of enterprises and the market remain unchanged in the established target standards. The problem of competitiveness was

raised in their studies by Post, Preston and Sachs (2002), Rumelt (1997), Hotelling (1990), Krivorotov (2014), Arrow, Block and Hurwicz (1959), Kozhevina (2012).

Competitiveness implies the dynamic stability of the basic economic characteristics of the enterprise and can be reflected by the formulation of certain targets, which are expressed by the ordering of some indicators of its economic condition. At the same time, we should not forget that sustainability is a property of enterprises that retains certain (specified, necessary) qualities during the observed period, allows resisting external influences. Based on this, it can be assumed that the planning of the conditions under which industrial enterprises do not move from one state to another (worse) can be controlled.

Within the framework of this study, the competitiveness of industrial enterprises is understood as the stability of maintaining competitiveness (achievement of strategic competitiveness) with a minimum of fluctuations in this criterion with respect to the trend. Strategic (Baloch & Inam, 2013) refers to the ability to maintain leadership in the long-term (10-25 years) perspective, based on the active development of innovative and investment factors in the context of objectively understood institutional transformations of the industry and the economy as a whole. The competitiveness of the organization has a number of properties:

- sufficiency for ensuring competitiveness and strategic development;
- adaptability to environmental changes and scientific and technical development;
- stability, determined by the technical cycle and the specified period of time;
- self-regulation and self-development in accordance with the dynamics of the internal environment;
- flexibility to ensure the competitiveness and development of the enterprise.

At the most abstract level, the competitiveness of industrial enterprises can be defined as a set of advantages, the use of which gives enterprises the opportunity to take a profitable position among competitors. Then the category of "competitiveness of the enterprise" and the category of "competitive advantages" - there are subordinate concepts, that is, "competitiveness" of the industrial enterprise is the result of the presence and use of competitive advantages. Therefore, competitive advantages - a system that has any exclusive value, giving superiority over competitors in the economic, technical and organizational spheres of activity (Mazilkina, 2007).

There are two types of advantages: comparative and competitive advantages. Comparative advantages ensure the competitiveness of an industrial enterprise through sources such as labor, natural resources (land) and capital. In modern conditions, only the availability of labor, capital, and raw materials do not ensure the competitive advantage of the enterprise, and precisely because they have become widely available, and thus the opportunity to gain advantages due to these differences is excluded. Proof of this is the acute awareness of the world's limited factors of production, in their classical sense, compared with the current and increasing level of needs. Therefore, due to the given objective circumstances, the task is to achieve the greatest satisfaction of needs with the least and rational use of resources and rational behavior of the economic entity. In an economy where all sectors can use advanced technology and highly skilled personnel to achieve a high level of development, the gap between production and service disappears.

However, where there is equality of conditions of functioning, the differences are leveled out. There is only one way out for producers – to create advantages (differences) themselves. Artificially created by the enterprise advantages in competition and should be attributed to competitive advantages.

Thus, competitive advantages are the determinants that determine and shape the competitiveness of an industrial enterprise, but at the same time, we can talk about the causal difference between these concepts. Competitiveness is the result of fixing the presence of competitive advantages. However, the presence of certain competitive advantages does not mean automatic preference, only in the complex they can have a decisive influence in choosing the best.

There is a certain hierarchy of concepts (table 1), which fits into the existing traditions of theoretical analysis and corresponds to the theoretical ascent from the abstract to the concrete: from the essential comparative advantages – through certain competitive advantages – to the criteria of competitiveness.

It should be borne in mind that the competitiveness of the enterprise and its competitive advantages are formed as a response to the factors of the external environment, including the characteristics of the market, industry, type of competition and its intensity, strategic opportunities and behavior of competitors, goals, and interests of customers, etc. So, the factors of the market environment that have an impact on the level of comparative competitive advantages, include market capacity, corporate structure, market conditions, segmentation, types of barriers to entry, etc. That is, the competitive position of the firm is a function of the state of the market environment, competition and competitors, industry factors that make up the macroeconomic, institutional and legislative, technological environment (Ogoleva & Radikov, 2003).

Table 1. The correlation between the concepts of "comparative advantages", "competitive advantages"

Comparative advantages	Competitive advantages	Competitiveness
An abstract category is used to characterize the preferential position of one market entity in comparison with another, which gives it the opportunity to win in a competitive struggle.	The result of the existence of comparative advantages, the concept corresponding to real market practice, related to real market opportunities (relative to costs or differentiation), and therefore, assuming a concrete practical form	The form of realization of competitive advantages, results of search and use by the market subject of new opportunities
The essential concept	It is a real representation of the essence, characterizes the conditions of market behavior	Expresses the result of market behavior
To identify comparative advantages, comparative characteristics of the effectiveness of the use of factors of production	It is expressed in specific indicators that can be accounted for and quantified (availability of a cheaper resource, economies of scale, availability of a special quality product), which indicates a certain source of leading position.	Empirical category, which has certain quantitative indicators. Competitiveness indicators quantify and qualitatively express competitive advantages.

In a simplified form, the definition of competitive advantage can be formulated as follows: manufacturers who sell their goods or services profitably have superiority over their rivals if customers prefer their products. However, some benefits are more valuable than others. In particular, in order to have competitive advantage has become strategically important, it is necessary to fulfill three conditions (Kevin, 2000).

1. Customers awareness of significant differences between goods or services offered by a particular company and those of its competitors. They must be unique in one or more key criteria for the evaluation of goods or services, according to which the real consumer choice is made and the decision to purchase is made.

2. This differentiation of products should be based on a sufficiently significant difference in the potential of producers, that is, the gap between the greater capabilities of a particular high-tech industrial enterprise and the less significant capabilities of its competitors. However, not every differentiation leads to the formation of a competitive advantage.

Differentiation should be based on key criteria of consumer choice. The set of such criteria practically does not include the "internal characteristics" of the manufacturer (for example, its location or the type of raw materials used). The only exceptions are those cases when these features cause the appearance of differences in the end product in terms of its delivery, influencing consumer decisions. In each specific market segment, the number of key criteria is limited, so effective differentiation of goods should be aimed at least one of the criteria included in this narrow circle.

The main criteria for the purchase are the price of the goods, the degree of its availability and such features as, for example, the quality of the goods, its appearance, functionality, availability of after-sales service, etc. in any case, the main properties of the offered products are taken into account, and very rarely - its additional features or functions. The cost of a product or service is not always a key criterion for the customer's choice of high-tech enterprise products. There are many examples of low prices that have not only not increased demand, but rather provoked a decline in demand or had no impact on consumer choice. An example is the experience of Texas Instruments. At the prices, the resources of competitiveness of industrial enterprises are almost exhausted. They are already comparable to the level of Western manufacturers and especially for high-tech equipment-processing centers, robotics. On the one hand, expensive components, on the other - constantly growing rates. And today's loans to domestic industrial enterprises are practically unavailable."

The gaps between the capabilities of competing companies can usually be classified into one of the following four categories (Kevin, 2002):

- a) Differences in corporate business systems due to the ability of a firm to perform individual functions more effectively than its competitors.
- b) Positional gaps arising from earlier decisions, as well as previous actions and circumstances. It takes into account the corporate reputation, consumer confidence, accumulated order book, irreversible investment decisions (for example, more profitable than competitors, the location of the enterprise).
- c) Differences caused by certain actions of the state in the field of legislation and economic regulation. This may be the obtaining of any patents and import quotas or the emergence of consumer safety laws.

d) Gaps caused by internal features of the organizational structure or the quality of management decisions. In turn, they are a consequence of whether the firm is able to innovate and adapt to market changes faster and more effectively than competitors.

3. Differences in the purchasing characteristics of products and in the potential of companies should exist for a long time. Thus, the competitiveness of industrial enterprises is the unity of intra-competitive advantages created by the business environment, but assimilated, integrated data by a competing enterprise. The external factors of competitive business environment mastered by industrial enterprises become their internal competitive advantages. Thus, from the point of view of creating competitive advantages, the production apparatus, all subsystems of a single production system should operate in the mode of optimizing the factors and parameters of the external and internal environment based on the unity of the elements of the integral system. Linking the scientific, technological, organizational level of production with the requirements of customers creates opportunities for the utmost use of the factors of production.

However, while industrial enterprises rely only on the policy of "importing" competitive advantages with a focus on "best practices" typical for efficient, competitive domestic and, mainly, foreign production companies, in practice, such enterprises often face serious problems of survival of these advantages. The fact that an imperfect internal environment, distortions in the management of often extinguish possible pulses of transformations that involve "imported" competitive advantage. Therefore, we cannot agree with the view that it is more effective not borrowing policy and the policy of growing competitive advantages – with the gradual introduction and integration into the existing system. These built-in competitive advantages provide the enterprise with competitive strength. Then competitive advantages are factors of competitiveness.

Competitive advantages have different forms of manifestation, which can be classified. The most complete division into groups is presented in Table 2.

Naturally, it is not possible to envisage all possible variants of the division. However, it can be stated that the classification is much easier if we take into account the extent to which the properties and characteristics of the competitive advantage allowing us to achieve the goal set by the industrial enterprise.

Therefore, in the study of competitive advantages, a systematic approach is important to ensure the identification and consideration of the most important factors affecting the evaluated (compared) objects. From the point of view of the system approach, it is important to create (modeling) sources of sustainable competitive advantage that provide the enterprise with the opportunity to achieve strategic competitiveness, the basis of which is the ability of the enterprise to implement a knowledge management system or training of the organization. Nile Fligstin in his work emphasizes the relevance of this area of ensuring competitiveness: "to withstand the onslaught of next-generation technologies, it is necessary to constantly improve the product, and the only way to do it is to train the organization" (Fligstein, 2004). Moreover, the ability to learn faster than its competitors is already considered as one of the few reliable sources of superiority over them. Goods that realize the simulated advantages that determine the requirements of consumers have "absolute" competitive advantages, that is, they have: first, a unique use value, and secondly, they necessarily overcome the framework of

competition for a certain time and occupy a monopoly position in the market, fully supported by the state and fixed by patenting fundamentally new characteristics of the goods.

Table 2. Classification of competitive advantages of an enterprise producing high technology products

Classification feature	Classification groups of competitive advantages	Classification feature	Classification groups of competitive advantages
Sphere of manifestation	In R&D in production in the implementation in product maintenance	Types of manifestation	Technical, economic, managerial
Level of manifestation	Forming the competitiveness of products, forming the competitiveness of the enterprise, forming the competitiveness of the region, forming the competitiveness of the country.	Benefit type	Material (based on material resources); Intangible (based on intangible resources): a) on intangible assets; b) on intellectual resources; c) on the relationship; d) on organizational resources.
Readiness for implementation	Real, potential	Source of occurrence	External, internal
Nature of the source	Based on economic factors, based on regulatory legal acts, structural nature, caused by administrative measures, determined by the level of development of the market infrastructure, technical and technological, based on awareness, based on geographic factors, based on demographic factors, of a non-legal nature	By the degree of measurability	Not measurable, these advantages are divided into simulated (formalizable, described with the help of models) and non-simulated (non-formalizable, have only a qualitative description). Measurable by expert means. Measurable by direct account.
By completeness	Accounted for New opportunities	On the way to achieve competitive advantages	Advantages of low order advantages of a high order
Whenever possible, use	Available inaccessible	The ability to simulate	Unique simulated
The degree of stability of the	Sustainable unsustainable	By constancy of impact	Permanent Periodic

Classification feature	Classification groups of competitive advantages	Classification feature	Classification groups of competitive advantages
manifestation of benefits.			Non-periodical Sporadic
If possible, create	Unreleased (basic) Created (developed)	Nature	Intense Extensive
By the degree of influence on competitiveness	The advantages of weak influence. The advantages of a strong influence. Multiplicative advantages	Market Coverage	On a separate market segment, on several market segments, in the market as a whole

Sustainable competitive advantage has several properties (characteristics): unique, difficult to copy, stable, applicable to different situations, better than competitors. For example, a resource that can provide the company with a sustainable advantage is the good reputation of the company, which is created over the years thanks to the constant exceptional quality of products and excellent service. A good reputation gives the company an advantage over its competitors. Excellent reputation in its specific expression is largely unique and, as a rule, there are only a few companies in the industry, that is, there is rarely and inextricably linked with the company that won it (a specific resource of the enterprise). A good reputation cannot be imitated by competitors, because the creation of something comparable requires a lot of years. In addition, accurate imitation is not possible, since the reputation of the enterprise can be formed based on a certain set of sources, such as product quality, innovative technology, excellent service, competent and professional staff, etc. the contribution of each source to the reputation cannot be accurately determined due to the ambiguity of cause-effect relations, objective difficulties of simulation, etc. If the company effectively and efficiently plan, maintain and use your online "reputation" within the framework of targeted management (management of resources), here are all the conditions to gain a sustainable resource of competitive advantage (Wolfgang, 2004).

In modern conditions, a large number of factors affect the competitiveness resistance industry. In this case, a change in the significance of various factors is observed (Table 3).

Table 3. Change in the importance of selected factors to ensure competitiveness, % (Unternehmerische Innovationspolitik in Deutschland: Ein Situationsbericht. Materials consulting firms «SCI Unternehmensberatung Görlitz», n.d.)

Factors	The 1970s	The 1990s
1.Reduction of production costs	19.7	13.9
2. Expansion of market share	46.9	12.7
3. Creating new products	25.3	57.4

The survey respondents identified the factors influencing the company's sustainability (Figure 1). They prefer factors related to the image of the company and its brand (Berns et al., 2009).

WHAT ARE THE BENEFITS OF ACTION?

Survey respondents cite the impact on a company's image and brand as the paramount benefit of addressing sustainability. But thought leaders differed — emphasizing instead a broad continuum of rewards grounded in value creation.

Figure 1. The results of the answers to the question "What are the benefits of action?" (Berns et al., 2009).

Thus, the presence of such an amount of information it requires systematization. In Table 4 we will result in results of the analysis of the influence of factors on the competitiveness of the industrial enterprises and functional areas of competitiveness of the enterprise.

It should be taken into account that a competitive advantage of any type gives enterprises a higher productivity than competitors.

The art of enterprises in achieving competitiveness consists in their emphasis on a particular competitive advantage or a combination of them. In modern conditions of management, as the practice notes, it is necessary to pay attention to as many factors as possible to ensure the competitiveness of the enterprise, and to find their favorable ratio. Alfred Marshall wrote (Marshall, 1961) that "the trend towards diversity is the main cause of progress". Obviously, the wider the organization's set of factors of competitiveness and the more diverse their configuration, the more favorable prerequisites it has for successful activity in the market.

Management of competitiveness requires the following actions: analysis of competitive advantages and weaknesses of the organization; definition of an integral assessment of competitiveness; development of general and local strategies for the preservation and development of competitiveness.

If the competitiveness is considered as a statistical characteristic of competitiveness indicators, then their fluctuations in the dynamics should be minimal, and correspond to a certain trend of their change.

Table 4. Assessment of the degree of influence of competitive advantage on the competitiveness of an enterprise

Competitive advantage	Innovative activity	Logistics	Internet technologies	Image	Branding technology	Mobile workforce
To competitiveness	+++	++	++	++	++	+
Functional areas of competitiveness	all	Economic, competitiveness of products	Marketing, financial	Marketing product competitiveness	Product Competitiveness	Staffing
Competitive resistance	+++	++	+++	+++	+++	+
Competitive advantage	And integration into foreign markets	Strategic planning	The productivity of fixed assets	Reducing the cost of manufacturing products	Compliance with international standards	Intellectual resources of the enterprise
To competitiveness	++	++	+++	++	+++	+++
Functional areas of competitiveness	Personnel, competitiveness of the management system, scientific and technological, production and technology	Competitiveness of the management system	Industrial-technological economic	Economic, financial	Competitiveness of products, ecological, industrial and technological	Scientific-technological, production-technological, personnel
Competitive resistance	+++	+++	++	+	+++	+++

+++ - strong influence; ++ - the effect is moderate; + - slight influence

These conditions underlie the assessment of competitiveness and are transformed into the formulation of two tasks:

1. Measuring the sustainability of enterprise competitiveness levels in dynamics. The solution of this problem is possible on the basis of calculations of individual stability

indices (i_y), which represent the ratio of the average of the levels above the trend (the average level of competitiveness for favorable periods of time - $\overline{F_{\delta n}}$) and the average of the levels below the trend (the average level of competitiveness for adverse time periods $\overline{F_{не\delta n}}$), which is expressed in the form of the formula:

$$i_y = \frac{\overline{F_{\delta n}}}{\overline{F_{не\delta n}}}$$

The closer the value of individual indices to unity, the less is the variability and, accordingly, the higher the stability.

Calculation by example

2. An assessment of the sustainability of the competitiveness of the VTCP can be obtained on the basis of the calculation of the Spearman coefficient (Aganbegyan, 2014):

$$K_{ycm} = 1 - \frac{6 \cdot \sum_{1}^n d^2}{n^3 - n}$$

where n is the number of observation periods;

d - p aznost grade level of competitiveness for years and ranks period rooms.

Interpretation of the Spearman coefficient is as follows: if each subsequent level of competitiveness is higher than the previous one, then the ranks of these levels and the

numbers of the periods coincide, that is, $K_{ycm} = +1$.

For comparative generalizing characteristics industrial competitiveness composed matrix shown in Figure 2.

Stability of the trend of competitiveness change	Unstable tendency ($K_{ucm} < 0.2$)	12	11	10
	Weak tendency stability ($0.2 \leq K_{ucm} < 0.4$)	7	8	9
	Average trend stability ($0.4 \leq K_{ucm} < 0.6$)	6	5	4
	High trend stability ($K_{ucm} \geq 0.6$)	1	2	3
		High ($i_y < 1,1$)	The average ($1,1 \leq i_y \leq 1,2$)	Low ($i_y > 1,2$)
		Individual stability of competitiveness levels		

Figure 2. Components of competitiveness

Enterprises falling into the quadrants 1, 2, 6 - have a high competitiveness; in 5, 7 - the average competitiveness; all other quadrants are characterized by low competitiveness.

According to this algorithm, the competitiveness of several enterprises has been assessed. These enterprises operate in the machine building industry in Russia. The evaluation results are represented in Table 5, 6. The table shows the levels of competitiveness in favorable times.

Table 5. Indices of enterprise competitiveness stability

Businesses	Levels of enterprise competitiveness								Individuals Sustainability Indexes levels competitiveness enterprises
	2008	2009	2010	2011	2012	2013	2014	2015	
The company with the highest level of individual competitiveness	0.553	0.523	0.448	0.475	0.36	0.495	0.424	0.535	1.01
Ent term with the lowest of individual competitiveness	0.556	0.437	0.369	0.573	0.573	0.521	0.59	0.6	1.275

Table 6. Evaluation of the stability of the trend of changes in enterprise competitiveness

Businesses	Ranks are equal to her competitiveness of enterprises								Coefficient of Spearman
	2008	2009	2010	2011	2012	2013	2014	2015	
The company with the highest level of individual competitiveness	8	6	3	4	1	5	2	7	-0.29
Ent term with the lowest of individual competitiveness	4	2	1	5	6	3	7	8	0.71

Management of the organization's competitiveness is carried out on the basis of compliance with certain requirements:

1. Mandatory analysis of the mechanism of action of economic laws.
2. Knowledge of the mechanism of action of the laws of the organization of structures and processes.
3. Compliance with the requirements of a set of scientific approaches to management.
4. Focus on specific markets and needs.
5. System automation of management.
6. Progressive methods of analysis, forecasting, rationing, optimization.
7. Focus on quantitative methods of evaluation and control.
8. The design of the models for the evaluation of competitiveness should take into account the weight of the incoming factors.
9. The indicators included in the assessment model of both aggregate capacity and competitiveness of the organization should be primarily dimensionless and relative.
10. Organic interrelation of the management system of competitiveness and strategic management, marketing, and human resources management.

Conclusion

The importance of studying the competitiveness of the enterprise is due to the fact that it is the firm's competitive positions that characterize the efficiency of its economic activities. The research carried out by us has made it possible to determine the factors that influence competitiveness. Such factors include expansion of the market share, product innovations. In addition, a significant role is played by the availability of competitive advantages and the business model used in the implementation of process innovations. A stable competitive advantage of the company is seen as a key factor of competitiveness.

The method for assessing competitiveness is presented, consisting of two stages: an assessment of the individual competitiveness of the enterprise and an assessment of trends in the change in competitiveness. For their calculation, standard and widely used statistical functions, such as the coordination coefficient, the rank correlation coefficient, were used. The approbation of the methodology was carried out at the enterprises of machine building in Russia. The study presents selective calculation results. The requirements of competitiveness management are defined. Presentation of the Methodic allows comparative analysis of different levels competitiveness stable enterprises. Secondly, monitor the change in competitiveness for a particular enterprise. This allows you to monitor the dynamics of competitiveness, point to apply management tools to ensure the stability of competitive positions.

Further research of the authors will be connected with the deepening of the study of the problems of ensuring competitiveness and competitiveness of industrial enterprises.

MANAGEMENT OF KNOWLEDGE WORKERS. SUPPORT FOR CREATIVE THINKING AND ACTION – THE CASE OF CREATIVE INDUSTRIES

Mieczysław MORAWSKI

Wrocław University of Economics

118/120 Komandorska St., 53-345 Wrocław, Poland

mieczyslaw.morawski@ue.wroc.pl

Abstract. Creativity remains the source of innovation and therefore talented workers, presenting large creative potential are highly desirable. Their activities are characterized by creative, unconventional, original thinking and functioning. Highly gifted people represent the core of Creative Industries (CI), especially in video games studios e.g.: computer specialists, animation programmer, concept artist, combat designers, creative audio director. Their activities are based on creativity. CI was defined as the activities which have their origin in individual creativity, skill and talent as well as open the potential for wealth and job creation by generating and taking advantage of intellectual property. It is of crucial importance to establish such working environment which enhances creativity. Creativity is fundamental for innovation processes the effects of which are increasingly complicated and complex. The activities characteristic for enterprises operating in the sector of creative industries are initiated based on the individual creativity of talented, open and competent workers. Simple management systems based on the confirmed forms of control, supervision, and formal procedures are insufficient to create added value in the sector of creative industries. The analysis of the subject literature provides some, but not many ideas on how to manage knowledge workers. It applies, in particular, to the new sector of creative industries. The aim of this paper is to develop a model of knowledge workers' management supporting creative thinking and acting. The research was based on survey studies. The survey questions were addressed to entrepreneurs and managers. The study sample consisted of several SME businesses operating in the sector of creative industries in Poland. The obtained results were used as the starting point in the discussion and in presenting the final conclusions. The paper will be divided into the following parts: the first offer the subject literature review: the essence of such phenomena creativity, knowledge worker in CI sector, the second describes the conducted empirical research including their results to be followed by the discussion presenting the Author's model of work environment for knowledge workers in creative industries includes factors enhancing creative thinking (third parts of chapter) The study was finalized with conclusions and the list of references. One of the conclusions: The elements of the work environment which stimulate creativity are mainly represented by the so-called "soft" management" components referring to various aspects of human capital management in an organization. Their coexistence has to be adequately focused on strengthening workers' skills, willingness and confidence in applying knowledge at an individual, group and organizational level.

Keywords: creativity; Creative Industries; knowledge workers; management of knowledge workers; model of the work environment.

Introduction

A creative person has the ability to invent and develop original ideas. Gifted people with many talents, creative and presenting competencies, which allow creating new ideas included in technologies and products, constitute the essence of creative industries sector, i.e.: computer technology specialists, fashion designers, architects, theatre and film artists, musician. Their activities are based on creativity. The vast majority of staff employed in enterprises operating in creative sectors participate in the processes of knowledge identification, absorption, accumulation, creation, transfer, and commercial application. Their personal knowledge, ingenuity, professional intuition constitutes the background for initiating consecutive business projects (Morawski, 2014, pp.708-715). CI requires a solid base of knowledge, some create capabilities to build greater competitiveness, the natural ability if shaping the climate conducive to encourage the creativity of the organization's human capital.

Highly gifted people represent the core of creative industries, e.g. ICT specialists, engineer, fashion designers, architects, theater artists, and filmmakers or musicians. Their activities are based on creativity and high competences. In the literature of management science, they are often called *knowledge workers*. Well-educated, talented are now responsible for finding new solutions which are to be translated into the development of their company. Human creativity and innovation at both the individual and group level, are the key drivers of these industries and have become the true wealth of nations in the 21st century. The analysis of the subject literature provides some, but not many ideas on how to manage knowledge workers. It applies, in particular, to the relatively new sectors of creative in The aim of this paper is to developing a model of knowledge workers' management supporting creative thinking and acting. The research was based on survey studies. The survey questions were addressed to entrepreneurs and managers. The study sample consisted of several SME businesses operating in the sector of creative industries in Poland. The obtained results were used as the starting point in the discussion and in presenting the final conclusions.

The paper will divided into the following parts: the first offers the subject literature review: the essence of such phenomena creativity, Creative Industries, knowledge worker in CI sector, the second describes the conducted empirical research including their results to be followed by the discussion presenting the Author's model of work environment for knowledge workers in creative industries includes factors enhancing creative thinking (third parts of chapter) The study was finalized with conclusions and the list of references.

Creative industries sectors and knowledge workers

Creative industries sectors (CIS) constitute the most important area in the contemporary global, knowledge-based economy. These enterprises which operate in creative sectors represent the most innovative business representatives. Creative sectors can contribute to that increase of innovation in other fields of the economy by providing them with ideas for a new product or service or delivering already finished projects. Such sectors generate both growth and employment as well. It is one of the most rapidly growing sectors of the world economy. Companies covered by CIS represent the perfect area of research focused on various aspects of knowledge management, e.g. strategic advantage coming from knowledge, human capital

management based on the approach to specialists, work in teams and others flexible forms of organizational structure, knowledge sharing processes, organizational learning processes and others. The term “creative industries” has been receiving theoretical and empirical attention within the last two decades (Hartley et al., 2012; Andari et al., 2007; Caves, 2000, 2003).

The following characteristics are decisive in terms of CI specificity (on the basis of the literature review):

- They provide products and services which are linked with cultural, artistic or usually entertaining value; in general, creative industries are deeper involved in the new value creation process than manufacturing industry (Berg & Hassink, 2016);
- Products are subject to continuous improvements, their ongoing development results from the swift verification of their usefulness and attractiveness by means of presentations, demonstrations, and meetings with clients, testing and sharing sample versions of products with their users, collecting valuable opinions through social networks
- Creative processes require the simultaneous involvement of specialized and highly diversified resources;
- Various products are created within the framework of CI: books, journal publications, visual art (painting, sculpture), performance art (theatre, opera, concerts, dancing), recordings, cinema and TV films, fashion, toys and computer games; e.g. NESTA model divides the diversified creative products into creative service providers, creative content producers, creative experience providers and creative originals producers (Flew, 2010);
- The majority of CI products represent goods perceived through visual, aesthetic or spiritual experiences. Their value is not based just on their market value or the one resulting from their functionality, but also and to a great extent, on their expressive value;
- It is necessary to detect, ahead of time, and search for a new formula which could meet the upcoming trends, fashions, changing fascinations and expectations;
- Most final output in the creative industry can reach consumers with the help of other inputs that respond to ordinary economic incentives. For example, a visual artist needs a gallery to display and promote his/her works to potential purchasers (Caves, 2003);
- Internal and external cooperation of an organization remains an imperative. Complex interactions between private and public sector are of major importance (Ratzenbock et al., 2004).

Before developing the concept of creative industries, culture and arts were structurally separated from economics, entrepreneurship, and innovation. Assuming the approach of CI, culture is described as a service category. The creative assets can be developed and then marketed. Since Tony Blair reconfigured the British Department of Heritage into the Department of C.M.&S. in the late 1990s, retrograde separations of culture and economics into different portfolios or policies would block more complex, innovative and entrepreneurial understandings of development and sustainability (Brabazon, 2015). CI definition presented by the UK Government's Department for Culture, Media and Sport is as follows: “Those industries which have their origin in individual creativity,

skill, and talent and which have a potential for wealth and job creation through the generation and exploitation of intellectual property”.

Creativity is fundamental for innovation processes the effects of which are increasingly complicated and complex. The activities characteristic for enterprises operating in the sector of creative industries are initiated based on the individual creativity of talented, open and competent workers. Simple management systems based on the confirmed forms of control, supervision, and formal procedures are insufficient to create added value in the sector of creative industries. The creativity of any kind cannot be based on pressure and compulsion. Continuous risks, resulting in negative emotions initiate narrow thinking patterns (Morris, 2001) manifested by the elimination or reduction of problems. Creativity requires knowledge, courage, and uniqueness. Therefore, creativity combined with a commercial approach to ideas requires the involvement of teams, free, informal communication, continuous knowledge sharing and the exchange of experiences.

The term of a knowledge worker is included among the concepts which characterize different categories and groups of employees distinguished among other members of an organization (team, community, enterprise) by the significantly higher level of knowledge, skills, experience, talent, predispositions, etc. In a broader sense, in the conditions of a knowledge-based economy (KBE) these workers create knowledge (or are potentially ready for it) based on the available information. Davenport claims that the primary purpose of a knowledge workers' job involves the creation, distribution, or application of knowledge. Knowledge workers think for a living (Davenport 2005). Mladkova states that knowledge workers represent the special group of highly qualified employees. The specificity of their work and management reflect the intangibility of their major tool and resource, i.e. knowledge. Owing to tacit knowledge, the entire knowledge remains intangible. The intangibility of knowledge makes knowledge workers special and difficult to manage. The most important part of work performed by knowledge workers happens in their heads, even though the final result may be material (Mladkova, 2013, p.446).

The analysis of subject literature (Abbasi et al., 2009; Davenport, 2005; Horwitz et al., 2008; Huang, 2011; Mladkova, 2013) allows concluding that the term 'knowledge workers' covers the category of modern employees distinguished by the following characteristics:

- high expectations regarding the autonomy and independence in implementing tasks and projects,
- high competencies and expertise supported by unique knowledge and experience,
- versatile skills of creative thinking in suggesting new and original solutions,
- interpersonal, leadership-oriented skills resulting from high intellectual potential and intensive professional activity,
- applying knowledge in its various processes, from acquiring and creating through sharing and using in the carried out tasks,
- involvement, at different organizational levels, in creating new knowledge constituting the basis for innovative processes and solutions,
- presenting “tacit” knowledge which offers opportunities for creating added value in an organization.

Emphasizing creativity in the sphere of knowledge workers' activities results in distinguishing a group of employees referred to as the creative ones. R. Florida is the progenitor of such interpretation of some part of knowledge workers. In his opinion, all members of the creative class are characterized by the "joined creativity ethos which values creativity, individualism, differences, and merits. For the creative class members all aspects and manifestations of creativity – technological, cultural, economic – are interrelated and inseparable" (Florida, 2010, p.31). In his definition, Florida divided the discussed class into two elements: the superactive core, represented by scientists, artists, designers, architects and other professions engaged in the creative process. The second component of the creative class consists of creative specialists, e.g. managers, lawyers, doctors and others. A slightly different, but probably more precise definition of creative professions is presented by Krätke (Krätke, 2010, pp.835-853). He distinguishes 5 groups and identifies two as the ones which are of particular significance for the regional innovative capacity. They include artistically creative workers (professional groups involved in culture).

Empirical research

Both in Europe and worldwide these are mainly small and medium size CI companies, usually set up as a result of initiatives and entrepreneurial efforts undertaken by young, educated and competent people attempting to commercialize their passions, invention, and interests. Research several companies in the sector of Creative Industries, conducted in recent years (2013-2014 located in Poland) by the teams of authors, allow to draw the following conclusions (Morawski, 2014, 2015):

- the desire to establish good relations between supervisors and co-workers,
- emotional relations between employees based on positive (sometimes negative) background and behavior,
- the vital rank of personal relations,
- strong identification with an organization in terms of compassion for common fate,
- openness and even enthusiasm towards new concepts,
- a formal approach to procedures, processes, and terminology in the course of performing every day, routine management duties.

It should be noted that the surveyed enterprises were characterized by the following features:

1. The limits between functional areas in the company are dimmed owing to positive feedbacks arising due to continuous information exchange and building, based on this information exchange, thorough knowledge about customers, suppliers, competitors, technologies and products
2. The vast majority of staff employed in CI enterprises operating in creative sectors participate in the processes of knowledge identification, absorption, accumulation, creation, transfer, and commercial application.
3. The major of staff employed in CI enterprises have high competencies and expertise supported by unique knowledge and represent university graduates.
4. Most employees have versatile skills of creative thinking in suggesting new and original solutions.

Summarizing the results of next author's survey (Morawski, 2016), it can be concluded, with adequate care in putting forward unequivocal opinions based on such small

research sample (the 11 small selected private businesses), that the owners of analyzed companies are fully aware of the specificity characteristic for human resources management in their operations. The responses to four questions referring to personnel management processes (recruitment, motivation, appraisal, development) indicated that company owners emphasize the significance of such factors as creative thinking, initiative and workers' ingenuity as well as the opportunities for their realization, but also independence as the motivating factor and the criterion of employee's appraisal, the willingness to share knowledge and the underlying interpersonal skills, including communication and cooperation. Among the factors decisive about company success the owners focused mainly on those related to employees and referring to communication, independence, creativity, involvement, and trust.

Model of the work environment for knowledge workers. discussion and conclusions

The exchange of knowledge between organization members allows developing the resources of shared knowledge with encoded different viewpoints and diverse problem-solving possibilities. It is a perfect background for making discoveries and creating innovations (Dalkir, 2005, pp.132-133). Modern innovations represent processes based on cooperation in integrated teams consisting of high-class specialists in various fields. Such teams guarantee to collect comprehensive, versatile and complementary knowledge from many areas and its appropriate application, resulting from the involvement of professionals.

When the intellect becomes a critical production factor, the successful enterprises differ from the less effective ones predominantly in their approach towards employees. Companies manifest appreciation by granting bonuses for their skills in interacting with others, their commitment, professional expertise, integrity, and other attitudes, but simultaneously create adequate conditions in which employees can develop, acquire new professional skills and increase their work value. In turn, however, the expectations and requirements from knowledge workers keep changing. The success of the growing number of knowledge workers is determined not only by the acquired knowledge but also by their swiftness in learning and sharing what they have learned (Tymon & Stumpf, 2003, p.12).

The increase in knowledge productivity is possible, e.g. through the totally unlimited knowledge transfer. Sharing knowledge generates solutions and benefits which ensure the enterprise competitive advantage (Reid, 2003, pp.43-49). Cultivating knowledge and competences among employees, encouraging creative thinking in teams, educating through organizational learning processes remains realistic only if the mutual trust and, consequently, the willingness to cooperate keeps building up between the organization participants. The more intense network of interpersonal relationships in an enterprise continuously multiplied and extended by the subsequent forms of interpersonal relations, the more developed its social capital. Ch. Evans quotes R. Scase, who said as follows: "whereas once an office used to be the place where work was done, today, in the information age, it is the place where ideas are exchanged and problems are solved. Therefore, office space should be designed in a way that encourages employees to enter into continuous contacts and exchange opinions" (Scase, 2002).

The ability to think creatively does not depend on IT infrastructure only, but more on social and intangible factors present within organizational culture, human and social capital. Creating an appropriate work environment requires integrating various areas of goals, decisions and activities, related to the simultaneous management of information, human capital, interpersonal relations and knowledge.

In the conditions of a turbulent environment, it is necessary to develop such organizational potential which ensures its creative modeling of the future by developing new products, technologies, market segments, etc. The correct anticipation of events remains its basis. However, only the enterprises characterized by a reserve of resources (or even their excess), especially the non-material, knowledge-based ones, whose configuration can be swiftly changed, allowing yet another synergic effect to be obtained, are capable of an anticipation oriented functioning. Accumulated, codified knowledge resources, widely available and continuously updated, constitute a collective organizational memory, which includes good practices, procedures of effective activities, technical descriptions of products representing an invaluable base of knowledge and experience. The collected resources are needed not only to fill in the current information gaps but also constitute a starting point for the new, original interpretation, enrichment, and transformation of what we already know into what we would like to know.

The available resources allow employees' training (internal workshops based on referring to codified experiences, generally available records of good practices, using notes, reports and projects included in enterprise databases), whereas the development of competences encourages establishing contacts and exchanging standpoints. The more intense relationships between employees of different nature (social, substantive, formal, informal contacts, etc.), frequency (regular, intensifying, etc.), content (opinions, recommendations, instructions, etc.), the closer and more direct they become, based on mutual understanding and increasing trust. The gradually densified network of connections between personnel gives rise to the sense of strong bonds and integration in terms of common values. The sense of functioning in a community is developed. The community members are increasingly willing to share their tacit knowledge with other members. It is followed by its absorption, analysis, interpretation, extension, placing in a different context, a different perspective adaptation and also other value judgments. Knowledge sharing processes result in its diffusion, an increase in the average level of competences, the dissemination of similar knowledge causes better understanding of both intentions and proposals offered by the cooperating partners. Discussions, questions, ideas are being developed, innovative processes are initiated.

The model of complex enterprise management in the sector of creative industries presented in Fig. 1 is of tier character. The tier at the model base represents accumulated explicit knowledge, acquired from various sources of an enterprise environment (clients, suppliers, business partners, government agencies, local government institutions, etc.) and from inside of an enterprise (employees, their families, managers, owners/shareholders, other groups: functional departments, project teams, trade unions, etc.).

Rich and diversified collections of knowledge accumulated over the years, is the derivative of applied technologies, manufactured products, provided services, as well as the accompanying events and processes (social, economic, financial, technical and

other), represent the basis for the structured process of knowledge and experience transfer to employees. Effective use of the acquired and codified knowledge is possible not only due to the appropriate technical means: programs, applications, equipment, but also the adequately planned and implemented methods of human capital management. Among the desirable solutions, the following should, for example, be listed: the solutions motivating to exchange knowledge, intensifying interpersonal communication, encouraging for cooperation, creating natural leaders focused on changes and creating openness in mutual contacts.

Figure 1. The model of complex enterprise management in the sector of creative industries
Source: own study and research

The two aforementioned tiers represent the organic basis for developing trust as a positive effect of cooperation based on knowledge and competences. Trust – an important element of social capital, built upon interpersonal relationships and the effect of activities strengthening partnership oriented organizational culture – plays a critical role because it strengthens the will to communicate and is of crucial importance for the exchange of knowledge within teams. Trust is related to problems associated with interpersonal contacts. It should be emphasized that trust is listed, in the subject literature, as one of the most often highlighted characteristics in terms of developing consistency in relationships. Therefore, the aspect of trust can be approached as one of the most important cross-sections in analyzing and classifying relationships, primarily when they are of interpersonal and inter-group nature. The developed social capital becomes the basis for less frequently planned, much more spontaneous, informal, interspersed with personal, social and non-substantive motivations of contacts between employees, experiencing close ties with colleagues, having the sense of joint professional interests and values. Creative thinking, sharing knowledge, developing new solutions becomes an unforced and natural component in the professional environment of knowledge workers.

The Author's model of the work environment for knowledge workers in CI includes factors enhancing creative thinking:

Organic leadership

- Searching for optimal – in terms of the effectiveness of knowledge sharing processes – styles of knowledge workers' leadership in such categories as decision making, employees' motivation, and development methods, building partner relationships, training successors and leaders;
- Organizing the course and access to learning processes, acquiring, transferring and applying knowledge;
- Devoting time for assistance and support by managers, stimulating ingenuity and other aspects of colleagues' intellectual efforts, focusing on employees' personal development, activities aimed at co-workers' integration with an organization;
- Teaching employees to take over the role of temporary intellectual and substantive leaders along with the development of appropriate managerial competencies.

Organization of teamwork

- Dissemination of team forms of professional activity organization developed following the initiative, coordinated and managed by key workers;
- Creating organizational and technical conditions for launching and developing independent social media platforms, bringing together the communities of practitioners, enthusiasts, and innovators within the enterprise employees.

Communication processes

- Development of comprehensive communication forms between the particular positions, departments and organizational units, overcoming communication barriers between the positions at various organizational levels, including the popularization of mentoring;
- Dissemination of good practices and principles for solving organizational problems by interdisciplinary teams representing workers of various professions, roles, functions and competences;
- Organizing regular workshops for all employees in an enterprise, providing their participants with the ability to use basic and advanced methods/techniques of verbal and non-verbal communication.

HR processes

- Modeling careers of outstanding employees (high competences, high development potential), including long-term plans for the succession of the most important positions and functions in an organization;
- Analyzing the importance of key workers in terms of an enterprise competitiveness: determining core competences, succession policy of top positions in the organizational hierarchy, paths of employees' transfer and promotion, localizing innovative knowledge, directions of tacit knowledge transfer;
- Analyzing both elements and level of the key workers' satisfaction;
- Continuous improvement of methods and tools for acquiring and retaining employees presenting unique competences, particularly important for maintaining competitive advantage and developing an attractive market offer;
- Preparing individual agreements regarding the share in company profits and other special privileges resulting from high competences;
- Constructing long-term development programs allowing permanent supplementing and extension of knowledge and competences, primarily the ones of both unique and innovative nature;

- Maintaining comprehensive and intense relationships with former key workers by involving individuals in the implementation of consultancy, training, expertise, etc.;
- Developing the brand of an attractive employer ensuring career based on competences and continuous improvement;
- Establishing the desired organizational culture of professionals, highlighting values resulting from the traditional relationship: master-apprentice;
- Efficient use of the resources related to the competencies of key workers (knowledge sharing systems, suggestion systems, competence management methods);
- Purposeful development of organizational memory resources aimed at preserving key knowledge resources by involving key workers in teamwork, a mentoring system, training and corporate university activities.

Additional solutions for improving and supporting creative thinking and performance can take the following form:

- organizing special places for uninterrupted and informal conversations between employees /tables next to coffee machines, rooms used during breaks at work, conference halls, training rooms/,
- special programs for adapting new employees, involving meetings and talks in selected departments and with selected organization members,
- a certain amount of time per work day /week, month/ offered to an employee for his/her free disposition /seeking advice and expert opinions, searching for information from databases, recording own observations and solutions in the generally accessible network, e.g. intranet/,
- formal meetings, meetings on a predetermined subject matter, agenda and final initiatives implemented into practice,
- sessions of ideas arranged spontaneously by co-workers,
- various electronic channels of information /Intranet, e-mail, websites/.

Creativity (author's attitude toward creativity phenomena) like any other mental effort requires intellectual engagement, reflection, concentration, creative passion, and personal interest. At the same time, it is the process of crossing some designated borders, questioning and overthrowing accepted and universally applicable principles or rules, defining problems and the reality in different ways. This means a violation of certain taboos, breaking the stereotypes, repudiation of allegiance to some theses applied in widespread awareness. The outcomes of creative work are both tangible and intangible, to a large extent unique and without past experience. Such understanding of creativity requires a number of conditions to be fulfilled.

Managing knowledge workers in an enterprise within the CI sector should not take the form of a closed project with ultimately outlined goals. The effects to be expected are continuous and essentially timeless, such as the development of good practices or the intensification of learning processes.

Abstract. *The financial services industry has changed in the last few years: it is more dynamic, focused on innovation and developing new technologies. Therefore, the transition from traditional banking to digital banking is faster than specialists thought it would be. Living in a world where globalization is forcing all the industries to adapt to a computer-based solution, banks are moving their activity online and delivering value-added services to their customers but also protect their data and make them feel secure. In order to emphasize the importance of new technologies in the banking sector, we will be analyzing existing data and will use theoretical perspective to explain the observed behavior of clients – from product to customer orientation. It is important to find the best solutions for the banking system in Romania to change the client behavior regarding the “digital revolution”. Based on statistics, the work brings forward the online banking penetration in Romania from 2006 to 2017. The paper defines the digital single market, which became one of the big priorities of the European Union. Its purpose is to bring down the barriers and unlock the online opportunities. The EU regulations, applicable in all the member states, aim for secure sourcing of banking services by using online/electronic platforms. What the EU wants, is to create a better digitalization of the banking system. Nevertheless, statistics show that both the banks and the clients showed their interest in using online banking products. The study presents the evolution of digital banking in Romania, top online services used by Romanians: online accounts, online loans, virtual payments, mobile banking.*

Keywords: *banking; digitalization; innovation; new technologies; finance.*

Introduction

The rapid evolution of technology is changing structurally the financial-banking services industry. We already live in a digital world and we cannot conceive of our life without a smartphone, tablet, laptop or smartphone, without a digital agenda, electronic wallet, electronic ticket or e-book. According to Kotler (1973), “one of the mixed blessings of

human history is that man increasingly lives, works, and plays in artificial environments.”

The traditional business model and classic bank branch are rethought. Banks focus on customer requirements, competition is on the rise, new financial services providers are emerging on the market, who show agility and are able to respond quickly to customer requirements, therefore creating an artificial environment based on digitalization. Banks need to be prepared to accept that digitization is everywhere, and the consumer is the one around whom gravity is or should be gravitating. The new technologies we are talking about today have real chances to cause major changes in financial institutions, but also to support the process of adapting them to new trends. Internet banking has gone quickly from being an exotic banking technology to a feature one expects to find at a commercial bank (DeYoung, Lang & Nolle, 2007).

It has been pointed out that mobile banking is a powerful new marketing and CRM tool for financial services companies (Sinisalo et al., 2007). A study made by ChauShen Chen (2013) shows that mobile banking users with different behavioral patterns have dissimilar perceptions of innovation benefits and risk.

It is already impossible to imagine our society without internet or mobile phones. Whether we like it or not, they have become part of our lives, they have become normality. Depending on the banks' response to the challenges posed by new technologies, this normality can become a threat or an opportunity. Moreover, the development of mobile commerce and mobile banking in different countries is significantly different (Zhang, Zhu & Liu, 2012). Shaping the future of banking and continuing with a brief analysis of the Romanians behavior regarding the online banking, the study is trying to create a picture of the future in banking.

Shaping the future of banking

Statistics show that consumers prefer more and more digital banking than traditional banking. The technology changes everything. Banks are forced to offer more value to their clients by creating innovations, applications, platforms and faster services. The economic analysts believe that it is a matter of time until the young generation, often called the millennials, will impose their requests in the banking industry. Innovating continuously in financial services influence the scope of financial intermediation and the nature of competition between intermediaries (Nickerson & Sullivan, 2003).

Going digital, clients have quick access to a debit card, without physically going to the bank. Moreover, more accounts can be attached to a single card, in more currencies. The digital nomads have developed secured desktop and mobile applications, digital signatures, instant online money transfers, geographic independence. Specialists believe that the traditional approach of banking should provide better infrastructure and invest in employers' education. Therefore, it is not an effective tool to reach millions of persons, especially those that do not live in main cities.

According to the research made by Mercury Research that involved 1000 subjects, 85% of them would prefer to interact with their bank employees through online video calls from home or in a branch, 84% of phone calls, or have virtual chat assistants (80%). The study attests that Romanians want to interact with banks through modern

communications channels based on new technologies. The Romanians' expectations, from their relationship with the banks, are the increase of employees' competence level and the attention paid to the relationship with the clients, followed by the improvement of the quality of the services. In the relationship with banks, customers want fast and simple support services, because they do not have the time and patience to wait in the physical offices, but they want a personal and trustworthy relationship with the bank. The banks of the future are those who will make the most of the technology to meet such requirements. Online video calls offer the opportunity to strengthen the personal relationship between clients and bank counselors as an easy alternative to direct human contact, benefiting the optimization of time and resources allocated to this.

According to a new MasterCard study (2017), conducted in 11 European countries, six out of 10 consumers welcome digital solutions, and I think digitalization of the banking industry makes their lives easier and safer. The study, conducted among European bank customers, shows that comfort is by far the most representative advantage of digital banking solutions, followed by time savings (70%) and ease of use (59%). The banks of the future are the ones who will make the most of the technology. The study attests that Romanians want to interact with banks through modern communications channels based on new technologies.

The MasterCard study (2017) also demonstrates that clients' loyalty to their current bank is relatively low: almost half of the consumers in Europe (49%) say they will consider switching to a digital bank at some point. In Germany, in particular, consumers show low loyalty: 27% of them plan to leave their current bank in the next 12 months, which is by far the highest rate in Europe. At the same time, the Dutch are the most loyal customers. Only 7% of them say they are considering changing their bank, and 52% want to stay with their bank.

In addition, European consumers believe that the digitization process in the financial sector will affect banks' branches. Two-thirds believe that the branches of banking institutions will continue to exist in the next ten years, but their number will drop, while 6% are convinced that they will cease to exist within ten years.

Evolution of digital banking in Romania

51% of Europeans aged between 16 and 74 years old used Internet banking services in 2017, a double percentage since 2007 when just 25% used this new technology. Taking a deeper look, Romania is on the penultimate spot in the European Union when we refer to the use of Internet Banking, with only 7% of the Romanian population using internet banking last year, according to data published by Eurostat. Only Bulgarians are positioned behind Romania, with only 5% of users. According to the report, only 24% of Europeans with secondary education use the service, the percentage rising to 77% for those with higher education. The penetration rate of Internet banking, as shown in the figure below, describes the top users of Internet banking in Europe: In Denmark, 90% of adults used Internet banking services in 2017, next, Norway (89% of citizens aged 16-74) followed by Finland (87%), Sweden (86%) and Estonia (79%).

However, between 2007 and 2017, the share of Internet banking has doubled in the EU from 25% to 51%, while in Romania it has tripled from 2% in 2007 to 7% in 2017. There is an appetite for going digital in our country as the statistics show, but going digital

doesn't mean eliminating the traditional banking. The statistics may be influenced by the social factor Social influence is defined by Venkatesh et al. (2003) as "the degree to which an individual perceives social influence important and believe he or she should use the new system".

In Romania, there are many categories of customers and we have to admit that not everyone is ready for digital services. Romania has many potential non-banking customers and it is hard to believe that our country will go directly from nonbanking to digital banking. What Romania needs, it is a period of time in which the two concepts will coexist. There are clients who have an increased appetite for digital financial services, but there are still many people who follow traditional banking. The clients want to come back to the bank to stand up with a counselor. Romania is still "a cash country", and customers who prefer this option need to be served.

The banks in our country strive to keep up with the technology and also allocate important resources to financial education projects, bringing Romanians closer to the digital banking concept. The approach of the local banking business on the idea of total digitization of financial-banking services is not yet a solution for the Romanian market, as there is a small mass of clients and potential clients receptive to the new technologies.

In the short term, digital banking is a priority investment in Romania. In the long run, this approach can become a revenue generator, but it depends on the customer segment that is targeted. However, we have to be aware that on the local market we will have a long period of time while we will still combine traditional banking with digital banking. Banks cannot give up on traditional banking unless they are in a market niche, which is currently quite small and cannot generate revenue to cover the huge investments. The concept of "open banking", promoted by the European directives on digitization, generates the possibility to apply other business models on the Romanian banking market and can greatly help in the new customer acquisition area.

I believe that traditional banking and digital banking will fight for a supremacy on the Romanian Banking market, but they can both survive and there is enough place for both concepts, but still, digitalization represents the future.

Online services in Romania

This statistic in figure 1 shows the online banking penetration in Romania from 2006 to 2016. In 2016, five percent of all individuals used the internet for online banking, but usage was higher among those who had used the internet within the last three months, at eight percent. Taking a look at the numbers we can say that Romanians use the new technologies more and more. Moreover, the banks in Romania have changed their strategy and invested in the online services.

Figure 1. Online penetration in Romania from 2006 to 2016 (Statista, 2018)

All the local banks used their strengths especially in digitization lately. The table below presents a short comparison of the top banks in Romania when talking about the new technologies: internet banking and mobile banking users.

Table 1. Comparison of internet banking applications of the top banks in Romania

BCR	BT BANK	BRD	RAIFFEISEN BANK	ING BANK
-150,000 users in 2016 - currently over 1 million digital clients, 17,800 POS, 2,500 ATMs, 41 cashless branches (according to a Facebook presentation in March 2018)	Approximately 16.8 million is the number of transactions made via BT24 Internet Banking, or over 3.5 million through Mobile Banking, up 16.8% and 126%, respectively, compared to the same period last year. - 350,000 mobile banking customers at the end of 2017, in February 2018 close to 400,000	- 1.4 million Internet / mobile banking contracts, up 21% (final 2017) - 2.33 million active clients - the number of transactions increased by 30% in 2017 and the number of connections by 45% - 460,000 final contracts for mobile banking application in 2017	- 470,000 users active in online banking applications in February 2018 (180,000 in 2016) - 2 million customers to 100,000 companies.	-Over 677,000 customers who have used the app in the past six months have accessed the account 29 million times the online services, 61% of them used the mobile application - has a 51% market share on Internet Banking

A mobile banking comparison between BCR and BT (table 2) shows that it is much easier to access the BT24 mobile application. BT 24 has several options, such as: changing card functions, paying for tax road fee, loading phone cards, receiving money Western Union, opening a new account in lei or other currency. In the table below it is emphasized that customers can use more features for the BT 24 than Touch 24 BCR.

Table 2. Comparison of mobile banking applications of BT Bank and BCR

Touch 24 (BCR)	BT 24 (BT)
-has three logins: static, e-token, or token -password access plus user number Quick options: opening account money deposits pay barcode scanning bills exchange currency internal transfer payment to other IBAN accounts payment to personalized templates	-has only one login option, with the static password, consisting of 5 numbers Quick options: sends money to your personal account pays a bill of utility, and scanning elbows exchange money payment in national currency or other currency pay templates opening money deposits application for BT funds buy the plane ticket recharge your phone card receives Western Union money customer service – ask messages change cards limits temporary lock, lost, stolen cards activate messages alerts reset card pin

Internet banking – a useful tool

Almost all banks offer this service to their customers when purchasing their debit card. Internet banking allows payment to merchants who have platforms developed for online sale.

The best-known feature that customers have access to is the payment of bills and taxes. There are some rules that, implemented, provide the guarantee of safe payments and which you can use to make savings.

How it works –As we mentioned before, banks include the Internet banking package in the services of a bank card. In the case of other banks, clients should make a request to the bank to obtain this service. Each bank designed a special internet page for internet banking where customers can always get access via a password. As a rule, the Internet banking subscription comes packaged with a token, a tool that generates a new password every time you log in, thus ensuring your transaction security. Some banks have given up this device, and every time they log in, with a standard login and

password, they send an SMS with a new password that will be used to access the internet banking service.

Safe Transactions - The problem that comes with the use of Internet banking services, which opens the way to numerous online payments, is that you expose yourself to all the dangers that are lurking on the internet. Cybercriminals can cause major damage from computer failure to accessing your bank account and stealing money from your account. Banking sites contain all the information you need to avoid these problems. The main advice from banks is not to provide card details to people who contact by email or telephone by pretending to be part of the bank's staff who need information shown on the debit or credit card. Also, using a firewall to stop unwanted access to computer data, using a secure browser, and keeping up-to-date, are some of the measures that can keep your computer and your bank account safe.

How to use the service to make savings - Payments to bills, merchant payments or money transfers to other accounts are the main facilities that this service provides. Basically, all of these transactions, which normally involve a bank transfer, can be done via internet banking in front of the computer. With the help of the service, the users will also have the exact records of all these expenses, access to the account statement, without going to the ATM, etc. An "expenses" x-ray will definitely help us eliminate the excess amounts spent.

Greater discounts or bonuses - Expense analysis is not the only way to save money. The same service provides customers with products that are cheaper in the online environment. As a result, banks are on a steady downward path, so they encourage customers to buy various products through internet banking to get rid of the costs of selling the same products in a branch (staffing and branch maintenance). Thus, most banks offer, for example, higher interest rates for open deposits through the internet banking service, and substantial commissions cuts that can even go to zero costs. The range of facilities goes far beyond these deals. For example, there are banks that have selected several partner retailers offering discounts on card purchases using the internet banking service.

Paying bills without costs - The facility that popularized the internet banking service is paying the bills by laying in front of the computer, so no need for that client to go to the vendor or the bank. Banks do not usually charge commissions for these payments, but that does not mean there is no cost. For example, if a vendor does not have an open bank account with the creditor who issued your card then you will need to pay the money from your account to the provider with an account with another bank. The transfer of money between two accounts opened at two different banks, involves the payment of an interchange fee. Instead, if the provider in question has an account with the same creditor who issued your card, there are banks that will not charge you any commission. Before you call the Internet Banking Service to pay your bills, it is advisable to make sure that the utility provider you pay for your bills has an account with your bank.

Payment of taxes - some banks have developed for the Internet banking service a tax payment application, which is usually free of charge. The few dozens of taxes and fees to be paid to the state budget have predefined sections on the internet banking website, the client only has to select the tax that must be paid and make the payment. In a hierarchy of the most time-consuming transactions in the life of the Romanians, the

payment of taxes is certainly the leading place. Through Internet banking, all this time can be saved. Also, internet banking can also be used to pay fines.

Mobile banking

Mobile banking is another useful tool that has been developed in the past few years and it makes it more interesting because of its great potential to “bring basic banking and electronic transactions services to unbanked consumers in developing markets” (Anderson, 2010). Ongoing advancements in smartphone technology, together with the emergence of a more demanding consumer, have created a new playing field for software providers. Mobile payments are a small but growing subset of the broader world of electronic payments (Porteous, 2006).

Focusing on the most common mobile banking activities, such as account balances (representing close to 50% of usage), transaction history and domestic transfers, the mobile application should be built with easy accessibility and user-friendliness at its absolute core. The application should try to provide quicker access to the most-used functions of digital banking, like balances, account history or domestic payments. That also means easier authentication and putting the favorite functions out in front of the customer as clearly as possible. The most striking quality is its high level of customization, appreciative of the fact that different customers have different needs. Based on a widget concept, each user is availed of a personal dashboard, as well as a ‘comfort zone’ screen, in which instant balance and account information is provided without the need to log in. It should be simple, relevant, accessible at any time and personal.

Complete package for financial institutions, the app also must provide the perfect platform to cross-sell additional services. Together with the inbuilt geo-location features on many of today’s smartphones, adverts, promotions and push notifications are triggered in direct correspondence to the account activities and financial profiles of respective users. The end-to-end sales process also includes providing customers with offer widgets on their dashboard, application forms, and call-back requests. However, such messages are based on using specific customer data and are not a means of bombarding banking customers with arbitrary – and often unwanted – adverts. The application should be smart: monitors how the customer does things, and then it learns from these actions, promoting them immediately if they need credit.

For banks, these applications are helping them to communicate more effectively and more relevantly. So, it’s not about hitting the customer with a lot of sales messages but using the knowledge of the customer insight gained through categorization to put out messages that are relevant. As previously mentioned, customers, on the whole, still use applications for checking their account balances, but peer-to-peer (P2P) is becoming a more popular mode of mobile payment, particularly among the younger generation. Attuned to such industry trends, it comes as no surprise that the application may also include a P2P money request gadget, through which payments can be made by email, SMS, and Facebook. In addition, users can collect money from external customers via the likes of PayPal, Pay-by-Link and SEPA. Such functions can also come in handy when splitting the bill between friends at a restaurant for example.

We can conclude that a mobile bank service can create stronger relationships with the existing ones between financial institutions and clients (Riquelme & Rios, 2010).

Digital single market – a priority for the European Union

In a growing digital environment, the Digital Single Market (PUD) has become one of the European Union's (EU) priorities. An essential step towards the PUD, Regulation (EU) 910/2014 on electronic identification and trust services for e-commerce transactions in the Internal Market (eIDAS Regulation) aimed at providing a "common foundation for secure electronic interaction between citizens, businesses and public authorities, thereby enhancing the effectiveness of public and private online services, of e-business and e-commerce "in the EU. According to this regulation, electronic identification and trust services - namely electronic signatures and seals, time stamps, electronic distribution services and internet site authentication services - are intended to benefit from the EU single market, ensuring uniform legal treatment in within the EU, by giving the electronically signed documents the same legal effects as paper documents with handwritten signature.

The eIDAS Regulation specifies that the legal effects of an electronic signature (irrespective of its category) and its admissibility as evidence in court cannot be denied only because it is in electronic form or because it does not fully comply with the requirements for qualified electronic signatures. The eIDAS regulation also provides that qualified electronic signatures have the legal effects of handwritten signatures. In addition, qualified electronic signatures based on qualified certificates issued by a Member State are recognized as such in all other Member States.

Based on the provisions of the eIDAS Regulation (applicable directly in all Member States and prevailing over any conflicting national law against it) and the Romanian legislation on distance contracts, credit institutions in Romania have the legal possibility to provide certain banking services through online/electronic platforms.

Based on the eIDAS Regulation, trusted service providers such as Cryptomathic, IDnow, Connective, DocuSign, and Adobe offer digital solutions that can be integrated into a bank's online platform and allow customers to apply advanced and/or qualified electronic signatures. Some EU credit institutions have already deployed solutions for the use of electronic signatures and seals for both natural and legal customers. These services complement the usual facilities of internet / online banking platforms, allowing customers to access online banking exclusively without the need to be physically present at the bank's counters.

Conclusions

Innovative solutions and applications are a priority on each bank's agenda. Whether we are talking about cards, online payments, intelligent ATMs, Internet Banking or Mobile Banking, new technologies increase the interaction of banks with customers, improve the performance of credit institutions and ease the lives of their users. Banks should focus on using the Internet's unique characteristics and capabilities to make their websites more reliable (Calisir & Gumussoy, 2008). The banks of the future are the ones who will bring out the best of the technology. The main reason is that customers want

to have quick access to services and information to avoid bureaucracy at banks' headquarters, using services based on new generation technologies.

The studies and research reveal that innovation attracts new customers. Transactional Internet banking is both a product innovation and a process innovation. (DeYoung, Lang & Nolle, 2007). Nevertheless, banks should adapt to the new technologies and include them in their present strategy.

All in all, the Digital Single Market that the EU is focused on, creates possibilities of further digitization of the EU banking system. From our information, there is interest both from banks and customers to access online banking products. The involvement of entrepreneurs in the field of financial technology and the alternatives that financial technology companies can offer to the traditional banking system can also stimulate banks to adopt such new technologies.

Adopting new technologies involves complex security and risk management requirements, alongside efforts to implement new European regulations. Banks focus on customer requirements, competition is on the rise, new financial service providers are emerging on the market, showing agility and being able to respond quickly to customer requirements. Modern banks have self-service areas, private areas where customized information can be provided to customers and provide customers with electronic tools, Internet and mobile access, electronic signature, and automated electronic processing of internal and external processes.

Abstract. *Terrorism becomes an essential issue for the security of any state. The fight against terrorism is a national and international desideratum that involves a specific culture for every citizen. Thus, the fighting actions against terrorism aims both to implement preventive measures with a preventive and deterrent role, as well as to cooperate between civil and military structures with the role of managing the consequences of the terrorist attack, together with the effective fight against terrorism through response measures active. The present research is a step in identifying the main ways to act against terrorist attacks and the objective is to screen the manners of the strategies were designed. Based on the facts and the reports on the terrorist activity at the global level, some consideration about the strategic priorities and strategies for expressed.*

Keywords: *strategy; terrorism; strategic priorities; strategic objectives.*

Introduction

Although terrorism as a social phenomenon has been present in almost all stages of the development of human civilization, until now the simple man and the political or military politicians have not felt or may have been unaware of the magnitude of this phenomenon so acutely at international level. We are dealing with a phenomenon that, through its implications, directly threatens not just the lives of individuals or human collectives, not just state security, but overall global stability, with profound and long-term implications for the fundamental values and legitimate aspirations of mankind.

This phenomenon is part of the contemporary society' peak of violence pyramid, immediately after the war and the armed conflict and before organized crime, the unorganized crime and the domestic violence underlying the pyramid (Duta, 2010). Consequently, such a danger can only be met by a sustained effort of solidarity at national and international level (Atanasiu & Stancila, 2014). Thus, we consider it absolutely necessary to align our strategic national and international strategy for the adoption of concrete strategies for the prevention and combating of terrorism. Solving this situation involves multiple, direct, radical and categorical, even violent solutions, aimed at curbing evil from the root, others indirect, consisting of well-designed

strategies of reducing the gaps and the effect of fallacy, harmonizing social and international relations, and on this basis of improvement of the human condition.

The new dimension of terrorism has determined, both at national and international level, not only a rethinking of how to combat it, but also the realization of a conceptual and appropriate legal framework necessary to materialize the measures established at the level of the political and military decisions of the states.

Together with the concept of terrorism, its development and evolution, was born the concept of counter-terrorism and it evolved accordingly to answer to the challenges. Governments has to set up different institution at the national level to can deal with a set of dimensions of the social life related with the terrorism as: ethics of democracy, individual's human rights, transparency and access to public information, need of security and so on (Kaplan, 2017). A second concern is to initiate networks due to the global dimension of the terrorism phenomena and the need to address to it at a global level too. The limits of the EU in this mater, the differences between the lows enforced are making the information sharing and the intelligence acting as a whole difficult and hybrid (Boer, 2015). Alongside the terrorism the countering violent extremism (CVE) was consider by the EU, at the national and union levels, with a holistic and collaborative approach, considerations taken into account by non-European countries too (Korn, 2016; Harris-Hogan, Barrelle, & Zammit, 2016). The CVE seems to be a prerequisite for terrorism and the pillars that EU considers are: prevention of radicalization, assistance of the most vulnerable categories to radicalization, and de-radicalization, pillars that are showing that the prevention place a first and most important role. Since 2005 the EU are dealing with Counter-terrorism Strategy and Strategy of Combating Radicalization and Recruitment to terrorism, to diminish this phenomena (Bakker, 2015; Korn, 2016; Harris-Hogan, Barrelle, & Zammit, 2016).

The paper objective is to analyze the evolution and changes on the terrorism activity at a global level, the counter measures that were tacked by the UN, EU, USA, NATO etc. and the strategies against terrorism and countering violent extremism, to create a global picture needed for Romania to set up its strategy as a boarder country of EU and NATO member. Based on the analysis some conclusion for the Romanian security structures were drown for a better understanding of the terrorism phenomena and the complexity of the effects in the social-economic environment.

Methodology of scientific research

In order to accomplish the present scientific research, the main source of information consisted in the study of the specialized literature in the field of this research, namely the theoretical documentation of the national and international legislation applicable to this topic, followed by an empirical research based on quantitative methods, the data taken from the internationally presented statistical information on the situation of terrorist attacks and the content analysis of the annual reports and institutional strategic plans of the Romanian public entities active in the field of preventing and combating terrorist acts. Based on the strategies and reports of the international and European bodies involved in the fight against terrorism and analyzing the counter-terrorism measures used by others (best practice), could be adjust the Romanian Strategy to the local conditions.

The terrorism – a complex, multidimensional phenomena

a) Trends of attacks, injured and deaths

The concept “terrorism” is first attested in November 1794, when Cadroy refers to “*the doctrine of partisans of terror*” when intense and violent fighting against counter-revolutionaries took place in his Opinion de Cadroy. It is a way of exercising power, not a means of action against it. Terrorism is defined today as violent acts committed in a political-revolutionary context. Since 1937 the definition of terrorism has manifold variants all of them referring to the acts and tools used to generate losses or injuries to other groups or states (Gioia, 2016). A definition proposed by the UN Secretary-General in 2004 and endorsed by France, considers terrorism as “*any action [...] which is intended to cause death or serious bodily injury to civilians or non-combatants, where the purpose such an act is, by its nature or context, to intimidate a population or to force a government or an international organization to take any action*”. The United Nations General Assembly considers terrorism as follows: “*Criminal acts that are designed or calculated for political purposes in order to provoke terror in public*” (Council of Europe, 2018).

The terrorist attacks of September 11, 2001 were a major impetus for policy change in the fight against terrorism. Despite all this, news is often heard about terrorist attacks taking place around the world. Based on studies conducted by the US National Anti-Terrorism Center, the evolution of terrorist attacks over the period 2005-2016 is presented in the figure below.

Figure 1. Evolution of global terrorist acts 2005-2016

(Source: authors processing based on the data presented on Country reports on terrorism, US Department of State)

We can appreciate a small decrease of the acts is shown from 2005 to 2012 flowed by an increase that place 2016 at the same level with 2005. **The first conclusion** could be that after ten years, if it was impossible to stop at least a part of the terrorist acts, we succeeded to keep them at a flat level.

Instead, the number of the injured persons knows a substantial decrease, knowing a minimal value on 2012 of 21,652 wounded, growing up on the next years to relatively flat amount of 33-34,000 wounded.

The number of deaths registered for the studied period has a waiving shape, it could be seen that the last year it goes to 20-30,000 compared with 2005-2012 when it says between 10-20,000 victims. **A second conclusion** is that the level of injured substantial was decrease, but the number of deaths was increase.

A third and sorrowful conclusion is that the decrease of the injured number was made due to the increase of deaths number. That means that the violence of the terrorist acts is much higher.

Year 2012 records the lowest level of all three studied indicators and represents a “*year of change*” in our opinion, should be connected with the death of Osama bin Laden in May 2011? There are several argues to sustain this starting with the fact that attacks from September 11, 2001 had a tremendous impact on the security, terrorism and counter-terrorism paradigms.

From 2001 to 2011 the US declares Osama bin Laden as the main target of the counter-terrorism fight and Perl (2007) in his report for the 110th Congress proposed three indicators to measure the progress against terrorism: Incidents, Attitudes and Trends. Argomaniz, Bures, & Kaunert (2015) are presenting the effects of 9/11 on the attitude of EU, approach of security, counter-terrorism and intelligence. All the measures that had been taken to create the “convergence” of the legislation and share information among the EU members. The main paradigm change was to place the security prior of the liberty. Not only the EU took measures, studied the terrorism phenomena and issued strategies that place an important role in addressing to this new challenges.

States from Asia and Africa also were shaken and reconsider their attitude against terrorism and there were changes in legislative framework, institutional structure, polices and strategies of counter-terrorism, reports and analysis were conducted to identify the vulnerabilities and the best way to address to the potential treats (Ewi & Aning, 2006; Allison, 2004).

There were opinions (Omelicheva, 2007) that the “*war on terrorism*” allowed the governments of Central Asian countries to exceed the justified response and to use excessive force in eradicate the Islamic militants.

b) Global terrorism index structural analysis

Using the Global Terrorism Reports issued by Institute of Economics and Peace in 2014-2017 (the 2014 report analysis period from 2000-2012, 2015 report refers to year 2014, 2016 report to year 2015 and 2017 report to year 2016) we are using the structure of the last report and organize the information, as much as possible to give a broad image of the terrorism activity and evolution in this period.

	2014 ¹²	2015	2016	2017
GTI Results	Terrorist activity significantly increased with about 44%; 85% of incidents were successful less than 2012	Terrorist activity increased with 80%	Deaths decrease with 10% 2015-2014	Deaths decrease with 13% 2016-2015 and 22% 2016-2014

	2014 ¹²	2015	2016	2017
	Iraq, Afghanistan, Pakistan, Nigeria, Syria – highest activity and impact 60% of incidents, 82% of deaths (54%↑ 2012)	Iraq, Nigeria, Afghanistan, Pakistan, Syria – highest activity and impact 78% of deaths	Iraq, Afghanistan, Nigeria, Pakistan, Syria - highest impact 72% deaths	Afghanistan, Nigeria, Syria, Pakistan and Iraq accounted 75% deaths; 4 of 5 countries recorded less
	26 countries had fewer deaths Highest increase in deaths Iraq 164%, largest reduction Cote d'Ivoire (-85%)	60% of studied countries do not experienced terrorist deaths	Iraq and Nigeria biggest decrease	Nigeria has the biggest reduction
	24 countries lost more than 50 lives; 60% ↑ 2012	11 countries (120%) have high level of terrorism (>500 deaths) compared with 5 in 2013	23 countries recorded highest number of deaths compared with 17 in 2014	Substantial decrease were in Yemen, Afghanistan and Syria
	GTI calculated for 162 countries	GTI calculated for 162 countries	GTI score ↓ 6% (76 country ↓ and 53 countries ↑)	GTI score ↓ 4% 163 countries
	60 countries experienced fatal terrorist incidents of 87 with incidents slightly up from 81 in 2012	93 countries experienced terrorist incident ↑ from 88 in 2013	274 known terrorist groups carried out attacks; 103 groups do not kill	77 countries recorded 1 death ↑18,5%
	Risk to be victim of homicide than to terrorist attack is 40 times higher	13 times more deaths from homicides than terrorism	ISIL attacks in 28 countries compared with 13 in 2014	Iraq ↑40% deaths
Trends	90% of suicide attacks placed in MENA and South Asia	Foreign fighters 50% from MENA, 21% from Europe and 4% from Turkey	2014 the worst of last 16 years, 93 countries attacked, 32,765 deaths	8 of 9 regions experienced an increase; North America a reduction
	13 countries with substantial risk of terrorist activity were identified	Nigeria has the largest increase in deaths – 300%; there are the houses of Boko Haram and Fulani groups	98% of deaths in US resulted from lone actor attacks	South Asia the most terrorist activity; Central and North America least
		Foreign fighters arrived in Iraq and Syria was high	ISIL foreign fighters have high education but low income; feeling exclusion	Egypt 9 times and Turkey 16 time increase in terrorism
	25% of attacks targeted citizens slightly increase	Attacks against citizens increased 172% (total number of deaths ↑ 80%)	Half plots with ISIL connection have been conducted by people without direct contact	Attacks against civilians ↑ 17%
	Weak political system, lack of legitimacy of government and group grievances are the main	Terrorist attacks on religious targets 11% ↓		Deaths from terrorism have risen in tandem with battle-related deaths

	2014 ¹²	2015	2016	2017
	reasons of terrorism than economic performance and level of violence			
	Terrorist incidents with extremely high number of deaths are rare (> 500)	ISIL causes more deaths in battlefield than terrorism attacks		Terrorist attacks are deadlier in conflict affected countries (2.4) versus non-conflict (1.3)
Terrorism in OECD Countries	Only 5% of the terrorist fatalities in OECD	Only 0.5% deaths occur in West except 9/11 (2.6%) ⁷	OECD countries dramatically increased; 21 of 34 recorded at least 1 death ¹	10,000 death between 1970-2016 (58% before 2000)
	Turkey and Mexico recorded the highest number of deaths and terrorist activity	Drivers of terrorism differs in wealthier countries than in poorer countries: a) OECD countries – youth unemployment, confidence I press, democracy, drug crime, immigration b) Non-OECD countries – armed conflict, corruption, weak business environment ¹¹	Terrorism is expected to occur in OECD countries with lower socio-economic performance ⁴	1% of global deaths; 10 times more than 2010
	PKK, ISIL, ITTS and DHKP/C groups were responsible for 75% deaths in OECD countries		In OECD and non-OECD countries attacks are related with the acceptance of rights, relations with neighbors, violence, terror ⁴	First semester recorded 3 time less deaths
	25% of deaths caused by lone actors			Unconventional tactics on soft victims are more effective than elaborate schemes
	There is significant correlation with: - Social hostility - Ongoing conflicts - Lack of intergroup cohesion - Political terror		ISIL affiliated attacks generates 313 deaths in 2015 compared with 18 in 2014 ²	ISIL attacks occurred in 18 of 33 countries and counted 75% of deaths

	2014 ¹²	2015	2016	2017
	- Security effectiveness - Group grievances...			
Characteristics of terrorism	Weapons: more than 60% explosives and 30% firearms	Terrorist activity is a significant driver of refugee activity and internal displacement ⁸	93% of terrorist attacks were in last 25 years in countries with high level of state terror ³	99% of terrorist deaths occurred in conflict or political terror countries
	40% with 1-5 fatalities, about 10% >5 fatalities	Terrorist activity is correlated with political violence - 92% of attacks in last 25 years in countries with political violence ¹⁰	90% of terrorist attacks occurred in countries engaged in violent conflicts ³	There are multiple paths of radicalization (education, income, religion, politics)
	72% of terrorist attacks occurred during a period of major conflict	Less than 0.6% occurred in countries without conflicts and political terror – country safety and security environment ¹⁰	0.5% of attacks are in countries without conflicts or terror ³	“us or them” mentality born from deprivation drive to terrorist recruitment
		Lone wolf attackers are the main perpetrators in West ⁸	Individual terrorist acts are unpredictable but with common statistical patterns ³	Lone actor attacks increased especially in US
	Peace pillars: - Free flow of information - Good relations with neighbors - Acceptance of other rights	Lack of respect for human rights and for international organizations are related with terrorism ¹⁰		
	Pareto principle 80% of deaths occurred in 17% of attacks			
Terrorist Groups	4 groups responsible for 66% deaths	Boko Haram and ISIL are responsible for 50% of deaths ⁶	4 groups responsible for 74% deaths	4 groups responsible for 59% deaths
	Deadliest groups Taliban and TTP, al-Qa’ida, Boko Haram and ISIL	Boko Haram overtakes ISIL and become the deadliest (317%↑) ⁵	ISIL deadliest in 2015 (surpassed Boko Haram)	ISIL deadliest in 2016 – 50% ↑
	Religion the main motive with a high increase, Political and separatism 3 times less and constant from 2000	Islamic fundamentalism was not the main cause of terrorism in West ⁹	Boko Haram 18% ↓ in number of people killed	ISIL in Iraq and Syria nearly defeated, 3 fold budged ↓
	ISIL and Boko Haram newly relevant		al-Qa’ida 17% ↓ in number of people killed	ISIL directed attacks in 15 countries; 30% ↑

	2014 ¹²	2015	2016	2017
	Shift between small nationalist/ethnic towards large broad religious or political goals		ISIL, Boko Haram, al-Qa'ida and Taliban – most active	Boko Haram, al-Qa'ida and Taliban groups had strong activity
	Ends: - 43% polarization - 40% policing - 10% achieving goals - 7% military force		Taliban in Afghanistan 29% [†] in number of people killed	Ways to end: attainment of political goals, splintering, or defeat – equal share
Economics of Terrorism		Economic cost – US\$ 52.9 billion, 61% ↑ 2000	Global economic impact – US\$ 89.6 billion, 15% ↓ 2014	Global economic impact – US\$ 84 billion, 7% ↓ 2015 and 19% ↓ 2014
	Indirect costs could be 10 to 20 times higher than the direct costs	Costs of terrorism are lower than other forms of violence	Iraq suffers the highest economic impact (17% of GDP)	Costs of counter-terrorism and CVP and indirect effects on business are not considered
	- GDP decrease - Changes in FDI - Insurance increase - Changes in customer behavior		Tourism contribution to GDP is twice larger in countries with no attacks	Largest terrorist groups are financially supported by transfers, donations, trafficking, taxation and extortion
	Increase government spending and affect other sectors as education, health, transport	Costs of counter-terrorism are significant and greater than the direct costs of terrorism	Peacekeeping and peacebuilding is 2% from the terrorism economic impact	Costs of an attack in Europe decrease significantly (less than 10,000 US\$) – kind of self-funded

Notes:

¹ Moved from GTI results to OECD section

² Moved from Trends to OECD section

³ Characteristics of terrorism in 2016 takes partially from "Correlates and Drivers of Terrorism"

⁴ Takes from "Correlates and Drivers of Terrorism"

⁵ Moved from GTI results to Terrorist Groups

⁶ Moved from Trends to Terrorist Groups

⁷ Taken from Terrorism in Western Countries

⁸ Moved from Terrorism in Western Countries to Characteristics of terrorism

⁹ Moved from Terrorism in Western Countries to Terrorist Groups

¹⁰ Characteristics of terrorism in 2015 takes partially from "Correlates and Drivers of Terrorism"

¹¹ Taken from Correlates and Drivers of Terrorism

¹² Totally different structure, organized by authors, report covers years 2000-2012

In 2016, more than 75% of terrorist attacks took place in countries such as Iraq, Afghanistan and India. Also smaller attacks took place in France, Florida and New York-USA

Premeditated terrorist attacks have changed relations between countries of the world and how they relate to security services at national and international level, generating a process of concentrating the efforts of the international community to adopt measures and deploy joint action to combat and prevent terrorism, which led to the adoption of

international strategies for the prevention and combating of acts of terrorism. International terrorism is a strategic threat not only for the US and EU countries, but also for Russia, China, India and many other countries, including Romania.

From the above comparison, we can highlight few lines:

- The terrorist activity increased in the last 5 years (2012 records the lowest level)
- The deaths resulted compared with the injuries highly grows
- Pareto principle applies 80% of the effects are produced by 20% of the attacks
- 5 countries record the highest activity Iraq, Nigeria, Afghanistan, Pakistan, Syria
- 4 terrorist groups are generating more than 50% of the deaths
- Deadliest groups Taliban, al-Qa'ida, Boko Haram and ISIL (they are disputing the first place, last 2 years ISIL)
- Countries in conflict are more exposes to terrorist acts
- Lone actors' acts are increased
- Reasons of radicalization are different in OECD countries (wealthier countries) than in non-OECD (poorer countries) and they are continuously changed
- The main targets are the individual citizens and their property
- Foreign fighter number increased
- The economic effects are decreasing
- Ways of terrorism financing is changing
- Costs of peacekeeping and peacebuilding
- Counter-terrorism measures and CVP should be considered together.

This consideration and the correlation calculated against GTI score argues and are the starting point for the prevention and counter-terrorism strategy.

The strongly correlated factors with GTI in 2016 (measured by INFORM index) are: conflicts, level of peace, political terror, group grievances, religious issues, humanitarian crisis, number of displaced people.

Hopefully in the mentioned reports Romania is recorded since 2000 up to 2016 with "zero" GTI score. This is not a reason for not having a prevention and counter-terrorism strategy or not being aware and preoccupied of the level of violence.

Institutional and legislative framework for preventing and combating terrorism

The vast majority of government strategies and programs developed in the democratic countries for the prevention and combating of terrorism primarily aim at achieving the following objectives: anticipation, prevention, discouragement and response. In this context, our country has also adopted legislative and administrative measures to protect the life, bodily integrity, freedom and dignity of its own citizens, representatives of foreign states and all individuals who are on the territory of our country, as shown in the following figure:

Agreements concluded by Romania on cooperation in preventing and combating terrorism confirm the determination to create a broad and unitary legal framework that meets the requirements of the global terrorist phenomenon. At our country level in 2001, the Romanian Intelligence Service becomes the ultimate authority to prevent acts of terrorism. In this context, the National Strategy for the Prevention and Combating of Terrorism is adopted.

Figure 2. National Anti-Terrorism Regulations
(Source: authors processing)

Law no. 535/2004 on the prevention and combating of terrorism is the legal framework that establishes the attributions of the public authorities and institutions within the National System for Prevention and Combating of Terrorism.

A proposal to amend the Law 535/2004 and to update it to the nowadays requests is under debate on the Romanian parliament. Together with the government is preparing a package of laws for national security. This will strongly refer to the immigration, terrorist activity, radicalization, violence and the intervention measures.

Strategies and strategic priorities in place to prevent and combat terrorism

In order to combat terrorism, Romania has acted and will act within NATO, the European Union and other international organizations to promote and consolidate democracy, to support governments and security and defense institutions in the fight against terrorism, to participate in multinational operations, the process of prevention, counteraction and post-conflict reconstruction.

Figure 3. Actions to prevent terrorism

Source: author processing

As part of the global counter-terrorism strategy, the prevention of terrorist acts plays a very important role and is manifested through:

- Actions to reduce functional imbalances;
- Maintaining the balance of forces;
- Combating the proliferation of this phenomenon.

Many times the problem of preventing terrorism is also difficult because some states are not willing to allow foreign powers to act without restrictions on their national territory (Stancila, 2007).

a) United Nations global antiterrorist strategy

In 2006, the General Assembly member states agreed for the first time on a common strategic framework – The Global Counter-Terrorism Strategy that is reviewed every two years. This unique instrument should allow the international community to strengthen its efforts in the fight against terrorism based on four pillars, as they are presented in figure no. 4.

Figure 4. Pillars of the UN Global Counter-Terrorism Strategy

Source: reproduction UN (2005)

Figure 5. Priority Axes of the United Nations Global Antiterrorist Strategy
Source: authors' selection from Plan of Action (UNGTS, 2006, Frunzeti, 2005)

In the Plan of Action (Annex of the Resolution adopted by the General Assembly on 8 September 2006, 60/288. The United Nations Global Counter-Terrorism Strategy) are detailed the main ways of the enforcement of the strategy in four chapters (see figure 5).

It could be seen that both strategy adopted on 2006 and revised systematically up to now, are focused on the “**protection**” and “**prevention**” as one of the main pillars.

b) European Union strategies to fight against terrorism

In 2005, the European Council adopted the EU Counter-Terrorism Strategy for Combating Terrorism Globally and Enhancing Security in Europe. As terrorist attacks continue to affect citizens in Europe and beyond, fighting terrorism is a top priority for the EU, its Member States and its partners.

The strategy focuses on four pillars showed in figure no.5.

Through the four pillars, the strategy recognizes the importance of cooperation with third countries and international institutions. The strategies start from the facts that acting and reacting means to register a previous action of the terrorists' groups, usually

involving victims (dead and wounded). To avoid this, and remain a peace promoter the prevention become the most important weapon.

Figure 6. Intervention pillars of the E.U. fight against terrorism
 (Source: authors processing European Council, 2005)

The EU like the UN highlighted in their strategies the importance of the states' cooperation and the need of strong cooperation in sharing information, creating networks and implementing preventing actions and the role of human rights and judicial systems. Cooperation seems to be a step behind integration, this is offering a better capacity of a common response, but being under the national judicial system and parliaments' authority their legitimacy and affect could be weakened (Manar, 2007; Nesi, 2016).

The border control is one of the most important component of the counter-terrorist measures. The EU strategy pays attention to it and there were certain measures that the member states have to implement. Unfortunately, the terrorist attacks from the time shows that it is a strong limitation of the effects of this measures, this border control could not totally stop the mobility of the terrorist actors (Krasmann, 2007; Le'onard, 2015).

Also, there are opinions that the EU strategy and the action plan (Bossong, 2008) is more a result of a long and tempestuous political proses that generates some the neglecting of the strategic dimension.

As a conclusion, the terrorism and extremism acts and actors are evolving and there are substantial changes in techniques, strategies and "*modus operandi*". To address to this challenges, we assume that the counter-terrorism and extremism prevention should consider the new trends and to adjust their strategy accordingly (Frazer & Nünlist, 2015; BIgo & al., 2017; Atran & al., 2017; Karlsrud, 2017).

Romania's national strategy to prevent and combat terrorism

Romania as member of UN, EU and NATO has to be connected to the "*last minute*" theories, agreements, evolutions and stages of the terrorism and at the same time to be part of the international efforts of counter-terrorism system and counter violent extremism trends. The strategy has to consider the link with the citizens and their perception on the security issue to accept the public spending needed for counter the terrorism activity and to prevent it, considering that the level in very low at this moment (Grigorescu, 2006; Grogorescu, Bob & Dobrescu, 2007).

The National Security Strategy of Romania is a major landmark of the fight against terrorism at national level. Romania's national security strategy is based on the existing international regulations in the field of counter-terrorism. In this context, the National

Strategy sets out the following general objectives, specific objectives and related action directions as in figure 7.

Figure 7: Action strategic objectives for preventing and combating terrorism within the National Strategy for preventing and combating terrorism (Source: own processing according to information from the Romanian National Strategy for prevention and combating of terrorism)

Conclusions

“As terrorism is a complex multidimensional phenomenon, effective response to the terrorism may need to take into account, and to some degree to be individually configured to respond to, the evolving goals, strategies, tactics and operating environment of different terrorists’ groups.” (Perl, 2007).

Romania in the Global Terrorism Reports issued by Institute of Economics and Peace in 2014-2017, that are covering 163 states and calculate the GTI, is recorded with “0” for the mentioned period. This are making us to feel very secure if we are not analyzing the main factors that are converging to this achievement. There is a risk to consider this and a success of the counter-terrorist measures, not as a result of a convergence of geo-economic multiple factors.

This conjuncture can be easily change any time that is why Romania has to be an active player on the network of counter-terrorism systems. In an increasingly turbulent and regional context, in the midst of the most deadly conflicts and intra-community breaks, terrorism becomes part of mankind's everyday life, especially through the media, in a quasi- collective, drowned in a kind of fatalism, leading to a tacit tactic of normalization and giving up the phenomenon as if it were something natural in human societies.

The strategy that Romania should develop and enforce has to be based on the findings of the potential risks and evolution. The findings of our analysis on the Global Terrorism Reports issued by Institute of Economics and Peace in 2014-2017, could be a starting point of the Romanian counter-terrorism strategy. Nevertheless, as a part of EU we should refer and integrate in the union counter-terrorist force and to respect the main lines of the EU strategy. Similarly, we are bound to take into consideration the UN strategy as a member state and to be prepared to act accordingly.

Only when terrorism hits the gates of a state, there is a temporary mass mobilization to condemn it and take action to fight it. However, the fight against terrorism is a daily, long-term adventure that can be won on all fronts with the help of well-grounded international strategies and adopted at national level. It is recommended to be aware with all opinion of the practitioners and researchers and to consider their finding in the process of strategy design (Bunn, 2016; Gioia, 2016; Kaplan, 2017; Boer, 2015).

We believe that an important role in the fight for preventing and combating terrorism is the strategic planning at the level of the main public entities that are active in combating this phenomenon. Thus, we considered it necessary to present the main international strategies adopted to prevent and combat terrorism. At national level, Romania aligns itself with these provisions, thus adopting the National Strategy for Combating and Preventing Terrorism, a strategy which also guides the strategic planning of the main ministries, organizations and institutions in Romania involved in the prevention and counter terrorism.

Abstract. *As the peer-to-peer innovation reshapes marketplaces and businesses, disruptive companies are also re-evaluating their internal processes and a part of them are tempted to abandon top-down hierarchy in lieu of decentralized business models. As the marketplace evolves to increasing decentralization, and a consumer-conducted through e-marketing universal market, business leaders and researchers are analyzing different manners that can comply these business trends in the way companies are structured and governed. With the aim of better understanding how to satisfy the internal and external client's needs, in order to produce value for the company, this work provides an analysis of the e-marketing most popular practices and a study on a new internal management system, Holacracy, with insight about what is the relationship between client and the company that has implemented it. Holacracy system is one of the most popular decentralized management approaches available at the moment which provides an organizational management model for making companies more adaptable, flexible and more responsive to change. In most of the companies, according to traditional management principles, each employee has an accurate definition of the job s/he has to perform through the job description. In Holacracy, employees can learn through training programs to perform new roles, giving up those that are no longer up to date through the company's evolution. Thus, the roles are being endowed with authority and not the people who perform those roles. This paper is presenting a study about Holacracy principles and the recommended "constitution" adopted by the companies that are implementing Holacracy by a comparative view with the classic management principles, considering the analysis on the digital e-marketing practices that are reshaping the relation between company and the internal and external clients. The benefits and the disadvantages presented by new management practice, Holacracy, will be pictured by a contextual analysis with today's business e-marketing conducted environment.*

Keywords: *holacracy; management practice; business structure; governance model.*

Introduction

As the peer-to-peer innovation reshapes marketplaces and businesses, disruptive companies are also re-evaluating their internal processes and a part of them are tempted to abandon top-down hierarchy in lieu of decentralized business models.

Modern companies like Airbnb, Uber, and Clever Taxi are conducting the so-called "peer-to-peer revolution", enforcing features like better flexibility and adaptability, greater efficiency, decentralized control. Peer-to-peer models seem destined to reshape more and more industries, as consumers seem more and more willing to streamline their lives and reduce the inefficiencies. As a consequence, the leaders of the companies are looking for business instruments and principles that are better shaping the increasingly decentralized marketplace. It is a real challenge for today's businesses to reach that flexibility and adaptability in reaction to the fast-changing business environment.

Also, today's people are keener to express their creativity, but very rarely today's organizations help their employees to use their passions and creativity at work. Also, in the traditional organization, since no voice can be taken into consideration unless it is associated with a hierarchical function, the extraordinary ability of people to feel the discordance of the present moment and to see the potential for change, it is actually unused.

In the book *What Matters Now*, G. Hamel (2012) states that even today, most organizations operate on a paradigm developed in the industrial age, predict & control based, where the CEO has the power over a hierarchically structured system. Success is achieved through planning, control, prevention of deviations. This type of organization focuses its attention on building a perfect system, preventing tensions. But the tensions arise anyway, forcing organizations to reorganize themselves to cope with the new reality. This type of organization management worked very well in the industrial age, leading to progress and developing new models of productivity and coordination. But in our era, named by some authors Conceptual Age, this management approach seems to no longer meet the new challenges in business: increased complexity, transparency, interconnectivity, economic and environmental instability, increased social responsibility.

In his book *Holacracy*, B. Robertson (2015) presents a new model of management, considered enough robust and comprehensive to be experimented as a promising approach to organize businesses, named holacracy. Holacracy means the organization's governance through people in order to accomplish its mission, as the author explains.

E-marketing importance in a consumer-conducted global market

In today's global market context, the change is necessary both in developing products and services, but also in the manner that they are offered to the market (Parr Rud, 2009). The extension of the digital transformation on a macroeconomic scale is marking a new digital transformation economy. The business environment has to facilitate this transformation by using new technologies for creating value and competitive advantage: considering a new type of offers, new kind of relationships, new business models, new management approach, etc. The modern business tools that companies are using today for managing the relationships with internal and external clients, with partners and

other stakeholders are empowered in particular through interaction (Eisenhauer, 2014).

Nowadays, any business, whether we are talking about a business whose activity is grounded in the physical environment, whether we are talking about one that is being developed in the online environment, they are all looking at the new methods of attracting clients through e-marketing. Also in Holacracy, e-marketing is an important component of the marketing strategy, considering that from the actions taken through e-marketing, essential information about the clients' behavior can be determined. This property to retain as many user data as possible is specific to the online environment, and if a person wants to use the services, it is possible for a cost. Much of the online business has its own integrated systems that aim to gather more detailed information about users to use them in promotion campaigns (Lazar, 2017; Taylor, 2018). Regardless of the management approach, whether we talk about a traditionally managed company or a Holacracy governed one, the e-marketing activities carried out for promotion are differentiated by personalized messages. It is taken into account the context in which the interaction between the user and the transmitted message takes place. For this, it looks at the consumer's profile, the interests that he or she has the whereabouts of the information, the device on which the information is sought, the physical location where it is when it comes in contact with the messages, the occupation occupied by the user.

E-marketing is an approach that promotes products and services through online tools and methods both in a traditionally managed company or in a holacracy governed one (Ward, 2017). E-business develops and implements business processes that intermediate it by doing the exchange of goods and services to get value added. E-marketing can be considered an e-business support action when digital methods are included in the marketing strategy of any online business, traditionally managed or holocratically governed. Google AdWords, SEO, Social Media, Email Marketing, Display Advertising, Affiliate Marketing, are part of the e-marketing mix, each of which has a contribution to be considered when designing e-marketing strategy.

Accelerated technological evolution of nowadays is allowing modern companies to combine and recombine new technologies, aiming at creating new values at a much faster tread than before. The purpose of it is continuously attracting and increasing the loyalty of the customers, partners, and employees.

Fast-changing business reality impact on traditional management and Holacracy

Given the increasing decentralization of the marketplace and a consumer-conducted through e-marketing universal market, the business environment is looking for different principles that can comply with these business trends, in the way companies are structured and governed (Gassmann, Frankenberger & Csik, 2015). It is more and more certain for today's business leaders the fact that the traditional organizational structures are not as adaptive as the extremely fast-changing reality of today's business environment requires. The work frames we know and we are following at work, are not as adaptable to change and as flexible as we need.

Holacracy is, in essence, a social technology for the governance and operation of an organization, defined by a set of rules different from those found in a traditionally governed organization (Aileron, 2017; Bernstein et al., 2016; Compagne, 2014).

In a traditional, lead-led organization, people do not have mechanisms to promote their diversity of ideas. There is only one way to promote a new idea, which is to convince the leader that the idea is valuable. If the leader does not share the new perspective brought by a colleague, he has no lever way in the hierarchical structure to promote his idea. In Holacracy, it is believed that any organization should harness the diversity of talents of the human resources available. As humans are so different, it is considered that each person is a sensor of the organization that leaches the reality through its own filter, adding a unique perspective to the organizational big picture.

In the traditional organization, because no voice will be taken into account unless it is associated with a hierarchical function, the extraordinary ability of people to feel the distances from the present moment and to see the potential for change is totally ignored. Right this window created between the actual reality and the predicted potential carries in Holacracy the name of tension. It is believed that that tension is an energy that is blocked but could be channeled into a beneficial change if they are processed timely. But these tensions usually remain on the ground and produce effects, sometimes leading to extremely negative outcomes for the organization. Organizations typically have more difficulties in processing than in acquiring problems, therefore this work is revealing that in any organization it is necessary a tension-processing approach.

In Holacracy, every tension an individual feels it is considered a sign of evolution if they are processed quickly and efficiently (Bernstein et al., 2016; Robertson, 2017). Most organizations operate on a paradigm developed in the industrial age - prediction & control - where the CEO has the power over a hierarchically structured system. Success is achieved through planning, control and preventing the deviations. The traditional organization focuses its attention on creating a perfect system and preventing tensions. This type of organization management worked very well in the industrial age, leading to progress and new models of productivity and coordination. But the tensions arise anyway, forcing organizations to reorganize themselves in order to be able to cope with the new reality and that is the reason why Holacracy takes a new approach to the business.

Holacracy principles

Aiming at a better understanding of the right manners to satisfy the internal and external client needs, this work is analyzing a new internal management system, Holacracy, with insight about what is the relationship between the client and the company that has implemented it. Holacracy is one of the most popular decentralized management system approaches available at the moment. Its popularity resides in the fact that it provides an organizational management model for helping organizations become more adaptable, flexible and more responsive to change.

The autocratic governance used to conduct today's organizations produces tensions that cannot be processed by empowering a group of people to the detriment of the majority, and it is called by B. Robertson (2015) a disempowering corporate structure.

Holacracy proposes a constitution that can be applied to any organization, defining authority as a legislative process to which we return whenever we need clarification, defining the rules of Holacracy, the generic roles to be assumed in the organization, the relationships between them, the main processes of governance and operational.

In the majority of the companies, governed through traditional management principles, the employees are working based on the definition of the job they have to perform through the job description. But usually, the job descriptions are imprecise, outdated and irrelevant to the employee's day-to-day work. And that is because the organization's charts are having usually a rigid structure that is not updated every time the activities of the companies are changing and evolving. In "Holacracy", people can have multiple roles, often in different teams (actually, teams are becoming circles), and role descriptions are constantly updated by the circle that actually perform the work. That generates dynamism of employees' roles which energize the work with clarity and awareness that most traditional workplaces do not reach. This allows people to feel more inspired to express their talents and creativity, an advantage that a company may not have learned through a traditional management (Aileron, 2017).

Holacracy is, in essence, a social technology for the governance and operation of an organization, defined by a set of rules different from those found in a traditionally governed organization.

The central characteristic elements of Holacracy are considered as presented below.

- *The Constitution* – it sets the rules of the game, distributing roles authority at the same time, defining authority as a legislative process to which we turn whenever we need clarification, the generic roles to be assumed in the organization, the relationships between them, the main processes of governance and operational.
- *A new way of structuring the organization and defining roles and authorities*, as presented in Figure 1. *The Governance Meeting Process* – is a separate process from the tactical meeting process where operational matters are discussed, specifically to give the best streamline to the problems regarding organizational structure; the governance process creates amends or removes policies, circle roles, sub-circles, or hosts the election process.
- *A unique and transparent decision-making process of updating roles activities* – Integrative Decision Making Process – a process design used in the governance meetings, in the tactical meetings as well as strategically meetings, for streaming the decision making process (collecting and processing opinions, proposals and objections by all the stakeholders and giving the best solution to implement in the most efficient timeframe).
- *A unique meeting process for team synchronization* – Tactical Meeting Process – with a unique design followed by everyone that is participating and guided through the meeting by a role entitled Facilitator.
- *The Election Process* – based on the Integrative Decision Making Process used by the circles to elect the generic roles in Holacracy: Facilitator, Secretary, Lead-link, for a specific amount of time defined by the Constitution;
- *The Strategic Meeting Process* – used in the strategic meetings for brainstorming and generating strategy, combined with the Integrative Decision Making Process.

Holacracy focuses on prioritizing and recording possible solutions when a crossroads appears rather than the predict-and-control approach used in the traditional governed organizations, where the strategy is governing. In Holacracy, the planning is achieved using the strategy meeting process, but it is not defined by the Constitution to be governing, because in Holacracy the reality is actually governing and is constantly reshaping the organization (Timmerman, 2015).

Figure 1. Holacracy Structure, adapted from www.Holacracy.org

Unlike an autocratic company that is managed over a strategy, Holacracy is based on the evolutionary algorithm. It is not designed by a certain person, but the governance process itself designs the design naturally, by solving all the tensions that appear, by the organizational sensors, the people.

Holacracy displaces the employees from the dependency relationships that we often see in a traditionally managed company, where managers decide and employees perform the tasks, in the sphere of autonomous relationships, where each one is responsible for their own role. And that is performed in the service of the organization's goals, such that no one feels victim because someone else decides for him (employees from a traditionally managed company) nor overwhelmed by responsibilities (managers of an autocratic company). This is an approach of how a whole new shift from personal leadership can transform in what is called by B. Robertson (2015, 2017), constitutionally derived power.

This passage from the autocratic management to holacracy is not easy and without challenges for any organization, as shown by the experiences of those who have implemented Holacracy. It is not an easy task to get people who have been leading the rest of the years to step back or to make people who have always been led by others to take the step forward and not only speak for themselves, but also fight for processing the tensions that they are feeling.

Employees in Holacracy realize that they no longer follow orders, they themselves have the power and authority of their own roles, but that comes in the bundle with increased responsibility. The power in holacracy transfers from the CEO – as in an autocratic company - to the organizational process that promotes a start-up mentality where everyone is challenged to think about solutions as for their own business.

Governance is the process by which authority is assigned to an organization, the power of a function being taken over by a process. This is a reason why this work is regarding the business process management and design as an important part for today's organizations that are looking for new instruments to challenge the new reality of business.

Benefits for organizations that are using Holacracy structure

The governance process defines clear roles with precise responsibilities, which makes the authority explicit, generating a change in organizational culture towards transparency and less influence. (Figure 2)

Figure 2. Workflow in Holacracy, adapted from www.Holacracy.org

In Holacracy, employees can learn through training programs to perform new roles, giving up those that are no longer up to date through the company's evolution. Thus, the roles are being endowed with authority and not the people who perform those roles. In Holacracy, it can be observed a shift from the power of the function and the person who owns it to the power residing in the organizational governance process.

Since Holacracy does not have a hierarchical structure, each role being autonomous and having individual authority, the roles are grouped into circles, the circles are integrated into larger circles, up to the Anchor Circle, that expresses the general purpose of the organization and controls all domains activity of the organization. Therefore, the people in Holacracy are having the power and the autonomy to perform their work without having to wait for approvals, with clear defined roles and responsibilities.

But the most interesting benefits a first analyze of Holacracy model is pointing at, are the governance instruments it has developed; the governance meeting process, the tactical meeting process, the strategically meeting process, the strategic meeting process, the integrative decision-making process. Moreover, Holacracy is based on the evolutionary algorithm; the governance process itself designs the design naturally through the governance meeting process, where all the tensions are processed.

Holacracy points out an interesting focus on prioritizing and recording possible solutions when a crossroads appears rather than using the predict-and-control approach like in the traditional governed organizations, where the strategy is governing. In Holacracy, the strategy is not defined by the Constitution to be governing the work, because in Holacracy the reality is actually governing and is constantly reshaping the organization. In Holacracy, every tension that an individual feel is a sign of evolution if those tensions are processed quickly and efficiently, giving to the Holacracy structures an evolutionary design.

Holacracy is regarded as a social technology for the governance and operation of an organization, defined by a Constitution that sets the rules different from those found in a traditionally governed organization but followed by everyone. They are no favoritism for specific groups of people in the favor of the majority or other unprofessional behaviors like influence or arrogance that the traditional structures are sometimes generating. The rules are the same for everyone and the process of governance gives the power of expressing a tension to everyone, not just to the leaders as we see in the traditional governed organizations.

Conclusions

This paper is presenting a primary study about Holacracy principles by a comparative view with the classic management policies, considering the analysis on the digital e-marketing practices that are reshaping the relationship between the company and the internal and external clients.

In an ongoing peer-to-peer revolution, enforcing features like better flexibility and adaptability, greater efficiency, decentralized control, where the people are keen on to expressing their creativity, the organizations needs nowadays to bust their soft skills like creativity and inspiration in order to cope with the new reality. The work frames we are used to implementing and follow in the business global environment, are not as adaptable to change and as flexible as we need.

Holacracy is a new management method that states principles serving organizational goals by shifting the power from personal leadership that is too often in organizations disempowering the majority in the favor of a small leading group, to what is called "constitutionally derived power". The rules are the same for everyone in Holacracy and

the process of governance gives the power to sense and a voice to express a tension to everyone, not just to the leaders as we see in the traditional governed organizations. The structure of Holacracy releases the dependency relationships of the employees with the managers, that are deciding and employees are performing the work in a new sphere of autonomous relationships, where each person is responsible for their own role. The specific unprofessional behaviors that the traditional organization is often generating through an autocratic management style, like influence or arrogance, are disappearing in a holocratic structure, where each individual is empowered for the role assigned.

Also, we can learn a model of an evolutionary structure, because in Holacracy the reality is governing, continuously reshaping the organization through the process of sensing and processing the tensions efficiently by the organization's sensors, the people.

The benefits presented by new management practice, Holacracy, are pictured by a contextual analysis with today's business e-marketing conducted environment, underlying the peer-to-peer models that seem destined to reshape today's business environment.

This paper is noticing that the creator of Holacracy, B. Robertson (2015) is not recommending tasting Holacracy by its attractive component parts and implementing just specific tools of it, just because it is difficult to assess such a big change in any kind of organization. However, this study is revealing new management tools used in Holacracy that are independent and can be tested in a traditional structured organization for attaining more efficient processes. This work is underlying instruments that are actually business processes, like Tactical Meeting Process, where operational matters are discussed, Governance Meeting Process streamlining the problems regarding organizational structure, the Strategic Meeting Process for generating the strategies, the Integrative Decision Making Process, a great design process that is processing opinions, proposals and objections by all the stakeholders and is giving the best decisions in the most efficient timeframe.

And also the Governance is the process by which authority is assigned, the power of the functions being taken over by a process. Therefore, this work is regarding the business process design and management as an important part to develop in organizations that are looking for new instruments to challenge the new reality of business.

Aiming at discovering new management instruments that can help businesses to feat the reality of the present moment and place, further work will research the possibility to test one by one the new challenging business instruments and processes that Holacracy has developed, in organizations based in Romania, governed by traditional management.

Abstract. *From any perspective, inherent conflict is an organizational process and an important part of organizational life. Motivations for conflict associated with human resources are endless. Conflict management has two major meanings: the generic term for all management actions on conflict (prevention/resolution, treatment consequences) and the strategies for control or regulation of conflicts which are lasting and resistant to positive solutions. Labor mobility is a form of movement in relation to the ever-changing needs of these productive factors. Hence, the labor movement is the workforce all the spaces in their profession and industry. The present paper aims to address, from a managerial perspective, the process of managing conflicts within organizations, starting from the analysis of the two dimensions, namely the processes and relationships specific to a public or private institution, and the second dimension, typical causes of conflicts and associated ways to manage them from the perspective of labor mobility. Management processes and relationships established within an organization have a direct reflection of how communication is made within an organization and, consequently, play a decisive role in the organizational conflict management mechanism.*

Keywords: conflict management, labor mobility, organization, contemporary economy market.

Introduction

Regarding globalization, one of the most important aspects of migration flows is gained relevance in the international landscape. In an increasingly difficult society, with business ideas, with goods and services crossing international borders, people are looking for targets refused in their own countries. Migration also entails costs for countries of origin due to the breakdown of family structures or the loss of human capital, but also to beneficiary countries in terms of rising social policy costs and reducing social cohesion. There are many situations when emigration becomes a

widespread and intensive phenomenon, thus fueling a vicious circle that promotes a regressive dynamic of abandoning productive activities in migrant communities.

In this context, a theoretical approach to the processes and managing relationships within an organization in general, as well as the particularities identified in the public institutions in Romania is achieved. Starting from these peculiarities, the elements specific to the intra-institutional communication process are identified, which has direct repercussions on the causes of the conflicts that arise within the public institutions.

The phenomenon of migration is often associated with painful experiences: people risk your life in a sea crossing with fragile boats, fraudulent border crossings using empirical methods (hidden in car-bound chassis, airplane fuselages, and truckloads). The European Union, which has substantially abolished migratory restrictions among members, is increasingly experiencing migration waves.

Labor mobility refers to the ease with which workers are able to move around in an economy and between different economies. It is an important factor in the study of the economy as it analyzes how labor, one of the most important factors of production, affects growth and development. International labor mobility has emerged as a major global problem and occupies an extremely important place on international, regional and national policy agendas. The phenomenon of labor migration is evolving rapidly (Riso, Secher & Andersen, 2014). This phenomenon, which can respond to labor market needs and changes, stimulates innovation and development, as well as the transfer and improvement of skills. However, migration is still very often associated with unacceptable workplace abuses. The conflict phenomenon is highlighted by the high social and economic costs of migration, inequality, and discrimination in the workplace in the destination countries, as well as difficulties in the integration process (Bercovitch, 1983).

The actual situation of labor mobility

The Maastricht Treaty introduced for the first time the term European citizen and the freedom of movement of people. In addition, labor mobility plays an important role in meeting the EU objectives, both internally and globally. EU Cohesion Policy invests in employment and long-term growth in Europe. It supports the European 2020 Strategy, which aims to have 75% of people aged 20-64 years in employment by 2020.

Labor mobility in the European Union has been increasing in recent years (Figure 1), but it is still not enough in the face of diverging labor market developments.

Despite the economic crisis, more and more the EU citizens have been living in another EU Member State since 2009 and the number of the EU-28 movers further grew in 2016. In 2016, there were roughly 12 million EU and EFTA (European Free Trade Association -Switzerland, Iceland, Liechtenstein, and Norway) movers in total. The number of movers was 5% more than 2015, which is a similar increase to the one in previous years. The population of movers is made up of 11.8 million EU-28 citizens and 170,000 EFTA citizens of working age (20-64) who were resident in an EU-28 country other than their country of citizenship (Fries-Tersch et al., 2017).

Figure 1. Employment rate by educational attainment level in the EU (Eurostat)

Labor mobility refers to the ease with which workers are able to move within an economy and between different countries. It is an important factor in the study of the economy as it analyzes how the labor force, one of the major factors of production, affects economic growth (Morokvasic-Muller, 2002). We meet two main types of labor mobility, see Table 1.

Table 1. Types of labor mobility

Geographic mobility	Occupational mobility
➤ Increase in labor supply. As more workers enter the economy, the general labor supply increases. An increase in labor supply accompanied by a static job demand can reduce wage rates.	➤ Increase in labor supply in certain industries. Smaller restrictions mean more time for the workers to enter another industry, which may mean that the job demand is easier to meet.
➤ Increase in unemployment. Unless employers require more than one worker, an increase in labor supply could lead to a hindrance to work.	➤ Smaller wage rates. If it is easier for workers to enter a particular industry, the labor supply will increase for a particular demand, which leads to a lowering of the wage rate until the balance is reached.
➤ Increases in productivity. Not all workers admitted to the job offer will be unqualified. An influx of workers can increase productivity if it brings specialist skills to the workplace and can push existing employees who are less productive.	➤ Allow emerging industries to grow. If an economy is heading for new industries, employees need to be available to lead the industry. A lack of employees means that overall productivity can be negatively affected because there are not enough employees to provide the service or to work with the machines used to make the product.

It is considered that greater labor mobility, both between jobs (occupational mobility) and between countries (geographical mobility), contributes to social and economic progress, to a higher level of employment and sustainable, balanced development. This mobility makes it easier and more efficient to adapt to the European economy, employment and labor to changing conditions and it represents a stimulant for change

in a globally competitive economy. A higher rate of mobility between the Member States will also encourage closer political integration within the EU (European Job Mobility Portal).

Mobility at work can be seen as the ability of people to go to another region or to another country to work. Labor mobility makes it possible to find more favorable working conditions as well as increasing professional experience.

The mobility of labor force in Romania

The totalitarian Romanian regime before 1989 considerably limited the travel possibilities of Romanian citizens. Thus, once with the fall of the communist regime, Romania recorded an exceptional emigration wave (Figure 2), in 1990 almost 100,000 Romanians have emigrated (Vasilcu & Sechet, 2011, p.215).

Figure 2. Number of Romanians who immigrated definitively to other countries between 1990-2016 (<http://statistici.insse.ro>)

We note that after the great upswing in 1990, in the following years, the number of migratory people considerably diminished; however, Romania continues to be a country of emigration so in 2016 the balance of international migration was negative; the number of permanent and temporary emigrants being 67,067 persons higher than the number of immigrants (www.insse.ro).

Immigrants are people who settle in Romania. Immigration is the action by which a person renounces his or her domicile from the territory of another state and establishes his domicile in Romania. Based on the statistical information, we can see that in recent years most people who immigrate to Romania are from Moldova so in 2016 the number represented 64% of the total number of foreign emigrants settled in Romania.

Figure 3. Number of people who immigrated to Romania between 2008 and 2016 (<http://statistici.insse.ro>)

Figure 4. Number of immigrants from the country of origin who immigrated to Romania between 2010-2016 (<http://statistici.insse.ro>)

Conflicts of work

Conflicts of work may arise as a result of a simple disagreement. Labor conflicts can occur between employees and the company, or just between two or more employees of the same company. If these conflicts are not given a solution, there is almost always a latent or declared tension between the protagonists that has negative effects on the company's internal climate. Labor conflicts often arise due to the negligence or passivity

of the actors. In an organization conflicts mostly occur because of gaps that arise between the formal structures of the organization (status, position, function) and informal structures describing the relationship between the actors (information exchange, work rhythm, competitiveness).

Conflicts of work are of several categories; Figure 5 presents their typology.

Conflict of work can be defined as the result of behavioral confrontations, motivations, needs, interests, opinions or values of individuals. As we can observe, labor conflicts can be collective, that is, it brings together more individuals gathered in a collective system or individual, which signals an individual struggle of an individual with one or more individuals within the same organization or even the entire organization.

Figure 5. Typology of labor conflicts

At national level, labor conflicts are governed by the Labor Code and the Law 168/1999, these being the main legal regulations dealing with issues related to labor conflicts and how to resolve them. According to these regulations, labor conflicts are defined as conflicts between the employees and the companies in which they work, which concern professional, economic or social interests. According to the information publicly declared at the national level (Figure 6), we notice that the number of labor conflicts is decreasing in the last years, thus in 2016, the number of labor conflicts decreased by about 80% compared to 2000.

Not finding a solution to labor conflicts can lead to confusion or refusal to cooperate, in the case when some problems appear, lack of deadlines or delays, increased stress among employees, reduction of creative collaboration and teamwork, interruption of the workflow (Belghiti-Mahut, 2003; Burloiu, 2004; Chiciudean & David, 2011; Iacob & Ccismaru, 2009; Lefter & Manolescu, 1995). Not solving work conflicts on time can have more negative effects, such as loss of time and energy, delays, unproductiveness, inefficiency, anger, sabotage, personal abuse.

Figure 6. Number of conflicts of work recorded nationwide between 2000-2016
(www.insse.ro)

Solving labor conflicts through labor mobility

Perhaps we have asked ourselves what the connection between labor conflicts and labor mobility is, as a viable answer we think we can solve or at least ameliorate the conflictual situation by posting/delegating or even moving one of the individuals involved in the conflict into another section, area or even another company. Vocational mobility can have many benefits for the employee; it can be a promotion, advancement, better working conditions, a more relaxing work environment. But at the same time, it can also have some disadvantages, such as time spent with getting used to the new job, additional expenses with moving, transport, and drop in professional performance. Conflicts are not always destructive, however, when a conflict gets bigger, managers need to understand and look for solutions to solve them (Afzalur Rahim, 2001, 2002). There must always be a rational program or process to resolve conflicts. Such a process must include a planned action response from the manager or organization.

Conclusions

Labor mobility is primarily intended to improve the lives of workers around the world. In this research I have shown that labor mobility has both positive effects, especially on the development of host countries, as well as negative effects on countries of origin, it is mainly about the impact of development, the loss of human capital, the deepening of demographic problems on a long term. Labor mobility has gained a bigger impact especially after Romania's accession to the European Union, immediately after the restrictions on the labor market had been abolished. Labor mobility must be seen as an opportunity that employees have to change their workplace. When we talk about labor mobility across borders, we encounter the so-called migration phenomenon of labor. This phenomenon has grown quite a lot in our country especially after 1990 and still remains at quite high rates. Thus, based on the public information presented by the National Institute of Statistics, we note that our country is still a country of migration, the number of people leaving the country especially for work in European countries, is increasing. Labor mobility is stimulated by destination countries, so more and more

Romanian specialists go abroad for higher salaries, better living, and better working conditions.

Addressing labor conflicts and the phenomenon of labor mobility can be achieved through a close link of dependence between these two existing issues within the national organizations. Thus, in this research we propose, as a key to solving labor conflicts, the labor mobility, of course, based on managerial programs and laborious strategies as well as involving the authorities by promoting national investment projects in human resource development.

THE USE OF THE CONCEPT OF *EMPLOYER BRANDING* AS A STRATEGIC TOOL FOR CREATING THE EMPLOYER'S IMAGE

Mariusz CIELEMEŃCKI

Wioletta WEREDA

*Military University of Technology in Warsaw
Gen. Witolda Urbanowicza 2 St., 00-908 Warsaw 46, Poland
weredawioletta@tlen.pl*

Abstract. *The strategic task of the management of each organization is to provide the right amount of qualifications to ensure the continuity of its proper functioning. The changes that have been occurring in the labor market over the past dozen or so years make finding and maintaining a valuable employee an extremely difficult task for the employer. Therefore, companies intensify their efforts to attract potential employees with their offer. Building an image of an attractive employer is now an extremely desirable competence in the labor market. One of the support tools in this field is employer branding (EB). Especially over the last dozen or so years, we have been observing an increase in the importance of this concept, both on the level of theory and practice. It is worth emphasizing that making efforts to build a brand is not a manifestation of current fashion, but has a much deeper cause. Some of them are in the organization itself, the others are penetrating from the changes taking place in the near or distant surroundings of the organization. The strongest impact on the increase in the interest of the employer branding organization are the changes taking place in the demographic sphere, i.e. the low birth rate, which results in the "contraction" of employees' potential on the labor market. This is both a quantitative and a qualitative aspect, for example, specialists are more and more desirable, being able to participate and implement several different projects in parallel. The need to implement tools in the field of employer brand building is confirmed by numerous studies. D. Brain, President & CEO of Edelman Europe, in the Edelman Trust Barometer report⁸ emphasizes that the importance of reputation is systematically growing as a decisive factor in the interest of potential employees (especially desirable specialists), attracting them to the organization and building trust that strengthens loyalty and allows the retention of employees. Bearing in mind that this is a relatively new concept and is still under development, the authors, based on the available literature, case study analysis and research carried out by research institutions, aim to systematize the knowledge in this area, identify the tools used in employer branding along with the characteristics of different generational groups of employees to whom these tools are addressed. This paper is an attempt to answer the following questions:*

1. What are the conditions for the growth of interest in employer branding in today's organizations?

⁸ This is a project that has been repetitive for 15 years, examining the views of opinion leaders from around the world regarding trust in institutions, companies and the media. The study takes place at the end of each year. For example, in 2007, it was made in 18 countries on a sample of 3,100 respondents (including 150 from Poland).

2. *What characterizes and what are the differences in the system of values, attitudes, behaviors, and needs of employees in the generation cross-section - internal recipients of employer branding activities?*
3. *How to consistently and long-term to build the image of the enterprise as an attractive employer and what benefits can entrepreneurs bring to the implementation of the discussed concept?*
4. *What tools are the most effective for implementing this concept?*

Keywords: *employer branding; new economy; labor market; brand strategy; employer's image.*

Introduction

The functioning of contemporary organizations requires constant activity in the area of permanent monitoring of changes, looking for ways of active respond to them and creating new methods and tools that give an advantage over the competition. In the conditions of the new economy, of which we are participants, the fundamental importance is becoming the competition based on non-material resources, which the central components are employees (Wereda & Kornec, 2017, p.45). Acquiring a valuable employee in the labor market becomes more and more difficult. One of the ways of attracting candidates to work in a contemporary organization is the implementation of the concept of employer branding. In its essence, this term describes all activities that are undertaken by the organization aimed at building the image as an attractive employer targeted at current and potential employees, business partners, clients and other stakeholders (Wereda et al., 2016, pp.27-31). This tool has recently been very popular with organizations that are increasingly interested in building a positive image as an employer. The employer's brand strength determines the institution's ability to attract candidates and retain current employees for a long time.

Employer branding – the essence and premises of the concept development

The concept of *employer branding* was first used in 1990 at a scientific conference organized by the Chartered Institute of Personnel and Development. The precursor of this concept is considered to be Simon Barrow - the author of the book entitled *The employer brand: bringing the best of brand management to people at work* (Barrow & Mosley, 2006). Since then, the topic has been undertaken by many researchers (Backhaus & Tikoo, 2004; Meier, 2006; Rosethorn, Mosley & Schmidt, 2017). In essence, the term "*employer branding*" means all activities that are undertaken by the organization aimed at building the image of an attractive employer targeted at current and potential employees, business partners, clients and other stakeholders. At the same time, the image of the employer (*employer image*) is understood as an image formed in the awareness of current and potential employees based on their personal experience or information reaching potential members of the organization from people already employed (Baruk, 2009). Another research adds that "employer brand is an intangible asset that allows companies to look for motivated and capable employees" (Hillebrandt, 2013). The presented approach shows that the organization's efforts to build a positive image should be carried out in two ways. First of all, they should be directed to currently employed employees (*internal employer branding*) and to people who are outside the formal framework of the organization, creating its external labor market (*external*

employer branding). At this point, a question may arise about the desirability of undertaking actions to build a positive image of the employer, their weight and business justification. Not without significance are such determinants as: a decrease in fertility of families, a higher percentage of people living alone, an increase in the professional activity of women or accompanying integration processes - migration of people (Clarke, 1997, pp.5-7).

This issue has been taken up in the past, including in 1997 by the consulting firm McKinsey's and such researchers as the mentioned ones: Ambler and Barrow (1996), Ewing and Pitt (2002) and Michaels, Jones and Axelrod (2001), who together with their co-workers summarized the picture of changes, distinguishing the characteristics of "old reality" and the current state, focusing on aspects, which increase the role of particularly talented people in organizations (Table 1). As Tanwar and Prasad said, "as in the marketing field, consumers are considered to be "kings", similarly, in HR, employees are considered to be the most crucial asset of an organization" (Tanwar & Prasad, 2017, p. 390).

Table 1. Old and new reality in the era of struggle for talents
(Source: Michaels, Handfield-Jones & Axelrod, 2001, p.6)

Old reality	New reality
1. People need companies.	1. Companies need people.
2. Machines, capital and location are competitive advantages.	2. Talented people are competitive advantages.
3. Possessing better talents stands out.	3. Possessing better talents stands out enormously.
4. Positions are a rare good.	4. Talents are a rare good.
5. The employees are loyal and the positions are safe	5. People are mobile and their involvement is short-term.
6. People accept the standard package that is offered to them.	6. People demand a lot more.

The changes taking place in the demographic profile of the developed world economies we are witnessing mean the aging of societies and, at the same time, a significant reduction in the number of people entering the labor markets, and thus a shortage of employees, especially those with high qualifications and development potential, often referred to as talents. In 2017, the population in Europe was 743,551,000, which means a steady increase, since 1960 (since surveys are carried out) the number was just over 605,000,000. However, since the beginning of the 1970s, the average age of inhabitants increased from 32.6 years to 41.9 today, which from the point of view of the labor market means shortening the period of professional activity. At the same time, the number of urban residents increased from 515,416,422 (71.0%) in 2000 to 553,271,500 (74.4%) in the previous year. The future, however, does not fill such optimism because, according to forecasts, the number of inhabitants will drop systematically (Table 2).

Table 2. Expected population in Europe in 2020-2050
(Source: *populationof.net*, 2018)

Year	Population	Y2Y	Migration	Age mean	Urban population
2020	743,595,000	-88,000 (-0,0%)	855,789	42,3	556,402,500 (74,8%)
2025	741,990,000	-486,000 (-0,1%)	909,864	43,2	563,579,800 (76,0%)
2030	737,814,000	-1,078,000 (-0,2%)	910,865	44	569,319,200 (77,2%)
2035	731,160,000	-1,449,000 (-0,2%)	910,865	44,8	573,456,700 (78,4%)
2040	723,735,000	-1,487,000 (-0,2%)	910,865	45,3	576,880,300 (79,7%)
2045	716,277,000	-1,509,000 (-0,2%)	910,864	45,7	579,701,800 (80,9%)
2050	708,423,000	-1,672,000 (-0,2%)	910,864	45,9	581,592,400 (82,1%)

The research periodically carried out by Manpower Group (in 2010, on a group of 35,000 employers in 36 countries, and in 2018 on a group of 39,195 employers from 42 countries) shows the global staff deficit. Looking from the perspective of today it can be seen that this is a deepening trend (Figure 1).

Figure 1. Global talent shortages reach 12-years high
(Source: *Manpower Group*, 2018)

Global results of the "Manpower Talent Shortage" survey from the first quarter of 2018 show that the largest problems with finding the right employees are experienced by companies from Japan (89%), Romania (81%), Taiwan (78%), Hong Kong (76%), Bulgaria (68%) and Turkey (66%) (Table 3). Countries, where employers have the least difficulty finding suitable employees, are China (13%), Ireland (18%), and the United Kingdom (19%) (Manpower Group, 2018). The practice of developed countries (USA, Great Britain or even China) indicates that the problem of gifted people, organization leaders, becomes a great challenge.

Table 3. Countries and Territories Facing Difficulty Hiring
(Source: Manpower Group, 2018)

Least Difficulty		Below Average Difficulty		Above Average Difficulty		Most Difficulty	
China	13%	Australia	34%	Finland	45%	Argentina ↓	52%
Ireland	18%	Brazil ↓	34%	Austria ↑	46%	Slovakia ↑	54%
UK	19%	Belgium	34%	USA	46%	India	56%
Netherlands	24%	Costa Rica	35%	Portugal ↑	46%	Singapore	56%
Spain	24%	Panama	35%	Israel ↓	49%	Greece	61%
Norway	25%	Czech	35%	Mexico ↑	50%	Turkey	66%
France	29%	Republic	37%	Germany	51%	Bulgaria	68%
South Africa	32%	Italy	38%	Hungary ↓	51%	Hong Kong	76%
Switzerland	33%	Guatemala	40%	Poland	51%	Taiwan	78%
		Slovenia	41%			Romania	81%
		Canada	42%			Japan	89%
		Colombia ↓	42%				
		Sweden	43%				
		Peru	44%				
		New Zealand					
↑ Greatest INCREASE since 2016 ↓ Greatest DECREASE since 2016							

According to the conclusions of this study, the "talent mismatch", i.e. the inability to find an employee with the right competence at the right place and time, is a threat to all employers. And today people, more often than finances, and especially the lack of talented staff, become a limitation of development. The facts confirm this thesis. Today, over 60 countries in the world have a negative natural increase (*Lista państw świata według przyrostu naturalnego*, 2018). In addition, the negative tendency deepens the possibility of early retirement. For example, in the United States, every second employee will be able to use this opportunity within the next ten years.

Another type of challenge facing organizations is the retention of already employed people; it is as important as getting a new employee. Most researchers argue that building a brand should start just from the inside of the company due to the fact that it is employees who occupy a very important place in the hierarchy of groups of the subjective environment in the process of creating the company's image (Budzyński, 2002, p.118). Activity in this area consists in ensuring positive feelings of current employees by creating friendly working conditions. The employer should perceive the employees as a subject - addressee of various initiatives undertaken and targeted at them. Only this approach creates circumstances for building bilateral relations between the organization and the employed (Baruk, 2006, pp.31-34). Employees are "company brand ambassadors" and the first recruiters. Surveys conducted in Poland show that in the situation of the strengthening employee market, the level of voluntary rotation in 2016 was 10.8%, which means that every 10th of employees left the company at own request (Antal, 2016). As Work Service points out, if employers fought for employees, it would be less probable they leave (Work Service, 2017). Meanwhile, apart from large companies, most do nothing or almost nothing. What's more, 8 out of 10 employers do not take rotation-limiting measures at all. Only 15% of companies are prepared for it.

Programs preventing employee departures can be found mainly in large companies (41.6%), employing over 250 people, and only sporadically they exist in small enterprises (10%). And the companies losing experienced employees who worked great results and had a big impact on productivity, suffer large measurable losses. Even the loss of a short-term employee (less than 12 months) is associated with costs because such a person has never been able to achieve full efficiency and "pay the costs" incurred by the employer in the course of recruitment and training. Proper perception of it by participants of the external and internal labor market, can be treated as a marketing tool, which skillful use may have direct consequences in optimizing external, but also internal relations and affect the results of market activity (Kiriakidou & Millward, 2000, p.50) Another area on which the demographic factor should be considered concerns is the generational change in the labor market is a fundamental change in the system of values, mode of operation and expectations of different generations of employees can be observed, as presented below.

Generations of employees - addressees of employer branding activities

When planning activities in the field of employer branding, one should be aware of the need to match them to a specific target group. Undertaking efforts in this area determines the accuracy of choosing the right communication instrument and the effectiveness of its impact on the employee. The best known in the literature is the division into four groups of generations of employees functioning in contemporary organizations (Marston, 2007):

- *mature*;
- *baby boomers*;
- *generation X*
- *generation Y*.

As the researchers point out (Kozłowski, 2012, p.21]), technological progress means that representatives of the generation named Z and Alfa appear on the labor market, representing new reality, including that in the virtual dimension (Figure 2).

The *mature* generation presented in the picture (people born before the end of World War II) is, in principle, still present on the labor market not larger than 5% of the total employed (Zych, 2011). These employees, who are still active, are characterized by organization, patience, loyalty to the organization, and the work rendered by them is a value for them and at the same time a motivating stimulus. The *baby boomer* generation - that is, the demographic boom which is a consequence of births in 1945-1969, is the most represented group on the modern labor market (in Poland it is about 1/3 of the total employed) - these are people characterized by loyalty and diligence, are considered to be individuals, for whom work is at the center of accepted value systems, even above its own passions, social relations or family. It is the approach to work that is the element that distinguishes this generation of employees from that which followed it, i.e. *generation X*. The term itself has come into common use for literature in the field of psychology and sociology.

Figure 2. The evolution of generations of employees and their values

Source: own study based on Robbins (2004, p.44), Kozłowski (2012, pp. 22-29), Wereda and Domanska-Szaruga (2015, pp.89-90)

Representatives of the X generation grew during the period of major political, social and economic transformations. They were accompanied, among others the destruction of the Berlin Wall, the collapse of communism in Central and Eastern Europe, the collapse of the USSR, the transformation of a centrally controlled economy into a free market economy. The last mentioned element is important from the point of view of employees because it determined new conditions in the labor market. As researchers note, it was typical for this group to struggle with the problems of finding a place for themselves in new circumstances, including the workplace, fears of loneliness and asking questions about the meaning of existence (Coupland, 2015). Another aspect is the fact that the time of growth of these people has become intertwined with the unprecedented rate of technical and technological development, especially the media (first television, then the Internet), which quite strongly create an attitude of consumption and promote certain patterns of life from western countries.

The turn of the 70s and 80s of the last century is the time when the next generation, called *generation Y*, is born. Because its representatives started to enter the labor market at the turn of the century, they are often referred to as *millennials* (*YouTube generation*). However, as Kozłowski argues, no date of birth determines the belonging to this generation, and the possibilities and conditions of the environment in which the process of their preparation to enter the labor market progressed (Kozłowski, 2012). It is worth emphasizing that this is the first generation, whose representatives are very similar to each other in many countries in the world; this is the effect of the opening of national borders, the consequence of which is the liberalization of the movement of employees and the development of communication technology. This generation is sometimes referred to as "*digital natives*" because they value the possibility of choice and flexibility both in the professional and private life. Millennials are constantly looking for ways to improve the impracticality of *baby boomers* and the lack of discipline in the generation of *baby boosters* (Grudzewski et al., 2010, pp.23-24).

The element distinguishing the *generation Y* from the subsequent *generation Z* is, above all, the incomparable ease of access to sources of information provided by the development of the ICT network, on the one hand, and the diversity of tools for transmitting and receiving information. Internet access is possible thanks to such resources as notebook, tablet, smartphone or iPad, not just a computer. The consequence of these possibilities is to significantly shorten access time or interact with others. Therefore, the *Z generation* is able to drink tea with friends, watch television in parallel, write text messages, chat and participate in online betting. This way of functioning in the environment determines particular preferences in the way work is provided. The need to enter into continuous interaction means that participation in several projects at the same time will be a challenging task for them.

The last of the generations presented - *generation A (or alpha)*, that is born in the 21st century, will function in an environment that will probably provide the greatest technological opportunities. Today, it is difficult to precisely indicate the values that *alpha* will follow, because the conditions in which they grow are constantly shaped by the influence of many factors, both predictable and unpredictable.

According to Deloitte's research, in the next 10 years, the *Y generation* will be 75% of the world's workforce, i.e. the majority. But employers will struggle not only with employing the young generation but also will have to find themselves in the

management of employees representing the *X generation* or people 50+. It is important that the EB tools used are appropriately tailored to a specific group of employees in such a way that they reflect the values, attitudes, behaviors, and expectations that they share. This determines the effectiveness of the efforts undertaken and the effectiveness of activities in this field (Deloitte, 2014).

Strategic building of the employer's brand with the use of selected employer branding tools

In recent years, the organization has been systematically growing in the awareness of the need to manage its brand. At the same time, operating entities are no longer about accidental, one-off or short-term actions. They are increasingly interested in programs that are carefully thought out and developed as part of the employer branding strategy, entered and resulting from personnel and marketing strategies. Activities in this field cannot be increased when searching for a candidate and reduced when it is found. Nor can it mean increased activity only for the advancement of the recruitment process. It must mean a series of consistent and long-term activities including:

- external and internal analysis of the employer's brand;
- analysis of the company's development trends;
- definition of the most important target groups;
- analysis of competition image activities;
- working out Employer Value Proposition (EVP) of the employer's brand, i.e. the declaration of why being an employee of this organization is better than employment in other companies;
- preparation of communication strategy based on the EVP brand of the employer;
- selection of strategic tools and communication channels;
- selection of performance measures;
- evaluation and improvement of the strategy (Macnar, 2016).

When it comes to the market for tools that can be used as part of the employer branding strategy, it should be noted that it is quite rich. Various forms of company presentations are available, which currently include both the virtual environment (online activity) and off-line environment. The employer should perceive employees as a subject - addressee of various initiatives undertaken and targeted at them. Only this approach creates circumstances for building bilateral relations between the organization and the employed (Baruk, 2006, pp.31-34).

From the point of view of image, it is important that an organization that declares itself as one that bases its competitiveness on human capital, which determines the ability to multiply knowledge capital and gives an opportunity to use the possibilities of the environment, systematically invests in it (Cielemęcki & Bombiak, 2016, p.142). According to the researchers, this is a frequent argument deciding about the employee's stay in the organization, and its lack is a frequent reason for rotation (Kozłowski, 2012, p.69). At present, the practice often used by employers is to integrate the career planning system with the image campaign. By offering consulting, mentoring, coaching, conducting assessment interviews, keeping records of successors and various types of training, they are perceived better than those who do not have a career management system developed and this is also one of the elements of the strategy of building a good opinion about the employer, remaining in the strict connection with other tools, e.g.

motivating. The best emphasize the self-development of employees, e.g. Google uses so-called model 70/20/10, in which each employee devotes 10% of one's time to training, 20% to develop own ideas, and 70% for the rest of the tasks outsourced by the company, which means that employees can feel an important part of the company and to follow its progress (bRenewal, 2017).

Transformations on the labor market, where it is increasingly difficult to find specialists, opening national borders, causing employee outflow, and a change in the approach to managing people - exert an increasingly stronger influence on the transformation of remuneration instruments. The review of the allowances used for the basic benefit shows that the most frequently used are: training, additional medical care, subsidies for holidays, free childcare, pension plans, life insurance (bRenewal, 2017). Companies are also increasingly implementing the so-called retention programs. These are extensive financial, social and professional benefits that an employee can receive if they stay in the company for a certain period of time. Such activities were once called "golden handcuffs", because their main goal is to design a package of benefits of work so that the employee would not be profitable to leave the company (*Wyzwania dla firm: jak zatrzymać cennego pracownika*, 2018).

It is also worth mentioning the so-called hygienic motivators in the work environment, i.e. those whose implementation does not significantly affect the increase of motivation, but their lack may contribute to a significant extent to its decline, i.e. a designated place where employees can eat, showers, air conditioning, and workplace ergonomics. According to CBRE's "How do we want to work?" A survey conducted in 2015 among corporate employees in Poland, the most important is the ability to influence the work and the company, but also the environment: temperature, noise, and amount of light, surroundings, choice of colleagues, and adaptation to the task, mood or time (CBRE, 2017). More and more companies, for these reasons, opt for smart offices, where employees choose their own place and way of work. The global Google tycoon (currently the highest rated brand) assumes that if employees spend most of their day at work, they should feel at home. The standard at company headquarters is, for example, slides between floors, a free canteen, swimming pools, and relaxation tubs. At first glance, these issues may seem secondary; it is worth quoting Polnord's research results here. It turns out that the average employee spends 73,920 hours at work, which is the equivalent of 40 years of age. It is hardly surprising that for 84.7% of surveyed office workers the immediate working environment is of great importance (*O czym marzą pracownicy polskich biurowców – sonda*, 2012). In turn, from the research of the social networking service StackOverflow, it appears that there is a positive correlation between job satisfaction and performance in an attractive office building (*Employer Branding – budowanie wizerunku firmy*, 2013).

As for the activities carried out within the framework of external branding, all activities in this field can be divided into two categories: image and recruitment. Initiatives mentioned in the first area are to serve primarily to raise the awareness of potential recipients about the organization itself and the profits associated with its functioning. In the process of building the brand, employers play an important role today in modern technologies and on-line tools. They include (*Sprawdzone narzędzia Employer Branding*, 2018):

- The professional career page has an attractive and trustworthy look as well as updated, interestingly presented information.

- Recruitment announcement;
- Internet search engines and SEO - as part of SEM (Search Engine Marketing) and SEO (Search Engine Optimization);
- Social Media - both those related to professionals (Goldenline, LinkedIn) and mass media (Facebook, Twitter) are an excellent form for EB activities.
- Professional recruitment films, company blogs, interactive games, newsletters, chats as well as online (virtual) job fairs.

In addition to the contemporary tools presented, there are several traditional (outside the network) forms of image building. They should not be deprecated and treated as ineffective because they have an asset that distinguishes them from on-line instruments, namely they offer the possibility of building direct interactions on the candidate-employer line. They include:

- A stationary job fair - a perfect form of building relationships with candidates is a stationary job fair, usually organized by Academic Career Bureaus (ABK) or student associations. The candidate can directly talk to the recruiter or employees of a given company, what is more, the direct form of contact raises more confidence in the company.
- Open Doors / Open Days in companies - events of this type allow you to familiarize with the specificity of the company live, directly at its headquarters/branch, you can learn about its structure, employees, and recruitment needs. All this will allow verifying your knowledge and ideas about the company in which one would like to work.

Shares at universities - the company's active presence at universities usually brings very good results. However, it requires systematic and long-term actions. The standard promotion tools at universities are all types of leaflets, brochures, posters and so on (Siwka, 2012).

Building a positive image of the employer on the example of ING Bank Śląski in Poland - a case study⁹

ING Bank Śląski belongs to the international ING Group. As part of the ING Bank Śląski group, it undertakes a number of activities aimed at shaping a positive image of the company as an employer. In 2017, ING won the Top Employer title for the eighth time¹⁰. In the seventh edition of the survey in 2017, "The most desirable employer in the opinion of specialists and managers" implemented in Poland by Antal in the banking industry took first place (23% of responses from respondents) distancing competition. The second in the ranking PKO BP bank was indicated only by 9% of respondents (PulshR, 2017). In 2016, it won the 4th place in the Employer of the Year 2016 ranking organized by AIESEC.

2016 marked the beginning of a new philosophy of image building. Until then, each of the Group's companies had separate employer branding activities. In 2016, the ING Group came out with the initiative of selecting a global Employer Value Proposition (EVP) based on shared organizational values and culture. As it results from the adopted

⁹ Own study based on *ING Bank Śląski Report* (2017).

¹⁰ The award is granted by the Top Employers Institute - an independent international organization.

sustainable development strategy, initiatives aimed at two target groups: professionals and students have been undertaken within the framework of the external branding of the employer. These for people with extensive professional experience included: participation in job fairs, development of a new employer profile on job offer portals, communication with candidates via social media platforms, such as LinkedIn, Facebook, Twitter, Instagram, YouTube and ING Community. Noteworthy is the WWW website, which allows applicants to apply. This process is preceded by a short psychological test that checks the characteristics of a potential employee.

The company undertakes activities dedicated to people entering the labor market (students and graduates); is present at universities, where career zones are organized, a series of workshops and substantive trainings for students, cooperates with scientific circles, student organizations and local governments of selected universities. It regularly organizes the Ambassador Program, which is a form of cooperation between ING Bank Śląski S.A. and university environments across Poland. ING student ambassadors cooperate with the bank in building the bank's image as an attractive employer at selected universities. Ambassadors operate under the mentoring of bank employees, offering support for learning ING and shaping career paths.

It is worth noting that activities aimed at creating such working conditions take into account the changing needs of employees. For example, since 2012, the bank has been running a program that allows employees to accumulate additional capital for retirement. Over 60 percent of employed have already joined it. The company constantly improves the tools and ways to provide information within the organization. The starting points are always regular meetings. Key information is also sent to employees via e-mails, in the form of news on the Intranet's main page and on the pages of the internal newspaper. Once a year, employees at all levels use the Annual Conversation - a tool that allows you to manage your own career, build a development path, increase your own effectiveness and gain motivation. Employees have the opportunity to regularly express their opinion on their work in an anonymous study of organizational culture. In 2016, 85 percent of employees took part in it.

ING Bank Śląski operates in accordance with the principle of "matching office", which consists of the division of space into zones for work, concentration, meetings, conceptual tasks and rest. Such an organization of space favors the exchange of ideas as well as informal and formal conversations. Available to the teams are design tables, meeting rooms and chill out. They are arranged in a new way, allowing easy formation into teams without changing the arrangement of the rooms. The surface is equipped with walls for writing and magnetic boards. Complementary for teams working in various places (Warsaw-Katowice) are videoconferences, enabling constant contact.

One of the clear trends in banking is co-creating new products and services together with customers. To realize this, the so-called LAB surface - open space with separate work areas for smaller teams. These areas were arranged in such a way that, depending on the intensity of work, there was a free opportunity to divide and separate from other users. Available to the teams are design tables, open meeting places and lockable rooms for loud work. Supplementing the basic function is a training space, equipped with multimedia equipment and a dedicated kitchen zone. The hybrid work model is conducive to both mobility and direct contact. Employees spend part of the day in different, sometimes away from the company places. This model is supported by

modern telecommunications and IT technology. For this reason, standard desks take up less space in a modern space arrangement. In the space created thanks to this, we can arrange, for example, additional meeting rooms.

Conclusions

Shaping the image of an attractive employer in a conscious manner has become a priority activity of the organization over the past years, wishing to attract and then maintain the best specialists on the market. As researchers note "(...) nowadays, the employer brand is a valuable intangible source of sustainable competitive advantages for the firm not only to recruit the best applicants from the external market but also to engage and retain talents inside" (Kuchеров & Samokish 2016, p.29). However, this cannot be an ad hoc effort, once in a way that is not coordinated with other activities. As the research results show, companies that operate in the manner described above and, for example, use only a few selected tools, do not achieve the expected benefits, which is manifested by high internal rotation or low brand assessment by the external environment. A case study of ING Bank Śląski, winner of many competitions for the best employers in Poland, confirms that building a coherent and positive image of the employer both inside and outside the organization requires that these efforts are considered important enough not to be left only on a declarative level. It should take a formal framework and be included in the organization's strategy. Such an approach testifies to the maturity of thinking and awareness of the importance of employer branding among the company's managers. It increases the chances of success in building a strong organization brand. The presented case study showing the actions taken by ING Bank Śląski, one of the leaders in the rankings of the best employers in Poland, allows the development of a set of potential tools for creating the employer's image, applicable to various organizational conditions.

Abstract. *In order to build our own future, we need to know ourselves better. In order to get rid of stress and feelings of helplessness, it is important to realize that the problems are not from the outside, not the others are to blame. Things we strongly believe have a significant impact on us. Our beliefs about our own person, about the world, about others, about our life perspectives - all our thoughts have an enormous impact on the man we become. The image we have of ourselves, of the others and of the surrounding world influences our behavior. There is a direct link between the style of communication and the effects we have on the sometimes positive, sometimes negative ones. Transactional Analysis is both a theory of communication and human personality. It is the analysis of the verbal and nonverbal messages exchanged on the communication process. It has evolved over the past decades, providing support in psychotherapy, personal development, education, management, marketing, sales, negotiation and communication in organizations. The "way of being" of individuals is observed in their behavior and in their style of communication. We analyzed the communication style predominant among the students at the Faculty of Economic Sciences at the "Ovidius" University of Constanta, a style of communication that reflects their dominant behavior. For this purpose, we used the questionnaire written by Julie Hay. Based on the questionnaires we analyzed, we selected 5 groups of 5 questions to see what motivates students in our university about their habits and self-confidence: the firmness with which they deal with those around them; the rationality they demonstrate in critical moments; obedience to others; the compassion it manifests; the attitude of giving orders. As a result of the analysis of these questionnaires, we noticed that the media of communication styles is attributed to an individual who has the predominant style of communication and behavior - the state of the Free Child, followed at very small differences by Adult and Careful Parent states. This means that predominantly university students predominate in their amiable and unstable attitude, the students being very relaxed, but also spontaneous and uninhibited, energetic and unguarded, predominantly predominant behavior in the first year of college. Likewise, this student also has the attitude of "here and now", but always carefully and caring about those around him.*

Keywords: *communication style; behavior; confidence; habits; transactional.*

Introduction

In order to build our own future, we need to know ourselves better. In order to get rid of stress and feelings of helplessness, it is important to acknowledge that problems do not come from the outside and that the others are not to blame.

The things we strongly believe in have a significant impact on us. Our beliefs about our own person, about the world, about the others, about our life perspectives – all our thoughts have an enormous impact on the person we become. The image we have of ourselves, of the others and of the surrounding world influences our behavior. There is a direct connection between the communication style and the effects we have on the people around us, which are sometimes positive and sometimes negative (Agabrian, 2008).

Each of us should propose, in the morning, in front of the mirror, to be the best version of ourselves every day. We need to be aware that every unfavorable situation we are going through has an equivalent or even a greater benefit.

The individuals' "way of being" is noticed in their behavior and in their communication style. We have analyzed the communication style that predominates among the students of the Faculty of Economic Sciences at the "Ovidius" University of Constanta, a communication style that reflects their dominant behavior.

Communication is the most valuable tool of today's leaders. The difference between a good and an excellent leader is given by the attitude wherewith s/he faces possible obstacles. An excellent leader is the one who creates leaders, while a weak leader creates executives (Ziglar, 2008).

Positive and realistic self-esteem develops the ability to make responsible decisions and the ability to cope with day-to-day pressures (Canfield & Hansen, 2012).

Transactional Analysis and the Ego States

In the last decades, transactional analysis has evolved, providing dedicated support in psychotherapy, personal development, education, management, marketing, sales, negotiation and communication across organizations (Popescu, 2001).

Transactional Analysis is both a theory of communication and human personality. Knowing and, above all, understanding the concepts and tools of transactional analysis means better self-knowledge, but also a better knowledge of others, as well as an effective tool for improving inter- and intra-personal communication.

Transactional analysis is, in fact, the analysis of verbal and non-verbal messages that underlie the communication process. From the point of view of transactional analysis, communication can be two-fold: explicit - it is carried out at a single personality level; complex - explicit and implicit, carried out at multiple personality levels (Navarro, 2014).

We are born with a "clean hardware" and in childhood, we begin to register, without discernment, most of the information we come into contact with. Through our senses, we experience life, but above all, we record what our parents tell us, then what the teachers tell us at school, and what all those labeled by our mind as "authorities" tell us. Later, with the aging process, although our mind filter develops, we remain with the same "habit" of taking "for granted" a lot of information provided by so-called "experts" in different areas. Being presented as "experts", we rarely question the information they hold. At some point, they no longer devote time to update the information they have. Over time, the information we receive turns into beliefs, convictions and/ or prejudices. The older we get, they get roots in our mind and turn it into a prison. This is how we become prisoners of our own mind, and the "escape" is far more complicated than we think at the first glance, because, according to Einstein, "It is easier to disintegrate an atom than a prejudice".

Human beings are not born with prejudices; there is no chromosome or gene that determines a person's bias level. People acquire prejudices from their parents at a very early age, and ultimately they incorporate them into their psychic structure and script, through frequent modeling, assignment, and guidelines (Shimoff & Kline, 2013).

Figure 1. Ego states: Parent, Adult, Child

(Source: author's personal processing after de Graaf & Kunst, 2010, p.56)

The "ego state" is the fundamental concept of transactional analysis. It is defined as "a certain" way of being, "a coherent system of thoughts and feelings manifested by an appropriate pattern of behavior (and thus the way it communicates)" (RTAA, 2006). An individual's behavior is reflected by the way s/he communicates. Each ego state has a negative and a positive component. Somebody's personality, his/ her psychic structure is "compressed into the ego state" or into the three "ways of being", i.e. Parent, Adult, Child.

Child

The Child ego state responds exactly as the person responded when s/he was a child, at a certain age. It is characterized by the expression of emotions, thoughts, and behavior similar to childhood: spontaneity, bursting into laughter/ crying, curiosity, wailing, enthusiasm, pain, frustration.

This ego state is divided into the following components:

Adaptive Child:

- when s/he complies with the limits imposed by the society, s/he is "good" (+)

- lacks courage; s/he accepts unfavorable situations, only not to upset the others (-)
- Free (natural) Child:
- spontaneous and creative (+)
 - s/he does what s/he wants, without worrying about the others (-)

Adult

The ego state wherewith the person objectively appreciates/ assesses the environment and calculates possibilities and probabilities based on his/her previous experience is called the Adult ego state. It manifests itself when we make real decisions and it is characterized by thoughts, feelings, concrete behaviors such as "here and now". When we are in this state, we do not have value judgments, nor do we relive past feelings, but we are just logical and rational in order to solve present problems.

Parent

When this ego state is active, the person responds exactly as one of his/her parents did, and even when the person does not openly manifest this ego state, it acts as a Parental influence, fulfilling the functions of consciousness. Our conception of everything that surrounds us is strongly influenced by childhood experiences, which we later associate with our Parent state. We are in this state when we feel, think, and act as the important people around us (parents, educators). The comparisons we make are based on the standards and values, rules and norms used by them. It "expresses the internalization of the behavior of those who took care of us" (de Graaf & Kunst, 2010, pg. 57) during the period when we were most easily influenced.

The Critical Parent:

- Fixes boundaries and provides a structure, a safe framework (+)
- Excessively critical and domineering, imposes restrictions and always manifests dissatisfaction (-)

The Nurturing Parent:

- Make us protectors, able to give people compliments and attention (+)
- Makes us too concerned with people or too indulgent, more than the other needs (-)

In a healthy communication process, all ego states are used flexibly and interchangeably, in order to communicate effectively with the other persons (goal-oriented, with the Adult on demand).

When communicating, at least two persons are present. The communication process seen through transactional analysis is, in fact, an exchange (a stimulus and a response) between the ego state of two interlocutors. An individual's action and the other's response constitute a transaction. There are three types of transactions, accompanied by rules:

The communication process is continuous when transactions are complementary. This means that one interlocutor addresses a certain state of the other, and the second responds from that exact state. This communication type generates satisfaction. For example, a student asks his/her teacher: "When can we discuss the concerns about my work?" In this case, s/he uses his/her adult state and addresses the teacher's Adult state.

The teacher also responds to the Adult state: "I cannot tell you the exact time. I do not have my agenda". The two can then set their appointment based on both agendas.

The communication process is disrupted when one of the interlocutors responds from a different ego state than the one to whom the stimulus was addressed, with a cross-transaction. In such communication, exchanges are shorter. For example, the student who used the Adult state in order to get an appointment with the teacher may receive another answer: "This is the fourth time you get stuck in this work!" These words, the tone and even the expression of the teacher's face reveal that s/he spoke from the Critical Parent state. In response, the student's Adaptive Child will react, and s/he will say in a toneless and apologetic voice, "I'm sorry, but I really do not understand how to do it". This type of transaction interrupts the conversation or leads it to another level; thus, these elements are used in order to guide the conversation.

Hidden transactions have psychological (non-verbal) effects. These transactions take place differently at each of the three levels, i.e. social, verbal and the psychological. For example: When the course begins, the teacher asks, "Have you read all the materials that I sent you, Ana?" Apparently, the teacher wants a piece of information, but whoever is careful is clearly hearing the Critical Parent from his/her question. Without stating it clearly, the teacher actually says: "I guess you're as unprepared as the last time". Ana answers both the expression in the teacher's eyes and the tone of his/her words, as an Adaptive Child: "Eh, what do you mean? Of course, I will present my work properly, you know that!" The teacher can then clarify: "No, wait, I just wanted to make sure you got your training right!" However, this is not totally true. A hidden transaction can cause many misunderstandings during the communication process, which may be conscious or unconscious. This transaction is used, most often, in psychological games or in manipulating the interlocutor. Non-verbal messages, transmitted at the psychological level, are predominant in the communication process.

The Egogram at Ovidius University of Constanta

Using the questionnaire drawn up by Julie Hay, attached in Appendix 1, we wanted to see and analyze the predominant communication style among the students from the Faculty of Economic Sciences, the Ovidius University of Constanta, which reflects their dominant behavior. This questionnaire was filled in by 150 students, from different years of study and from different specializations.

Figure 2. Average of the communication styles
(Source: personal questionnaire processing - Excel EGOGRAM)

After analyzing these questionnaires, we noticed that the average of the communication styles is attributed to an individual whose predominant communication and behavior style is represented by the Free Child state, closely followed by the Adult state and by the Nurturing Parent state. This means that, as far as university students are concerned, their amused and unstable attitude predominates, the students being very relaxed, but also spontaneous and uninhibited, energetic and uncontrollable; this behavior predominates especially in the first year of study. Likewise, these students exhibit the attitude of "here and now", but are always careful and caring about those around them (Keller, 2012).

By analyzing the 150 questionnaires individually, we noticed that only 2% of the analyzed students display the Adaptive Child state, as the dominant ego state. This means that 3 out of the 150 students display an obedient, shameful and sad attitude; sometimes they have a defiant tone because their motto is "I cannot do it". This result seems encouraging.

12 students, i.e. 8% of the total number of students, display the dominant communication style of the Critical Parent. These are students who criticize, who display an authoritative attitude, point their finger at "the guilty" and use a firm tone. They believe that "must" is a lifestyle and orientate their lives according to "what they should do".

16% of the 150 students are characterized by the Nurturing Parent's approach. These 24 students are generous, understanding, caring. They have an indulgent, gentle tone, being always those who provide moral support. They are always nice and kind to those around them, smiling at all times.

35 of the 150 students are predominantly in the Adult state, which means that they often make decisions based on present reasoning, without considering previous experiences. They are always very attentive and have a precise tone, indicating the interest in present and correct actions.

24% of the analyzed students display the communicative style of the Free Child, which has been discussed earlier. This means that almost a quarter of the total number of students manifest their genuine emotions, have an open attitude, are energetic, relaxed, and curious. 47 students make the noise that teachers complain about and show interest in what they are passionate about.

The remaining 29 students did not describe a single dominant behavior style, adopting different ego states in different situations.

Correlations between the elements of the questionnaire

Based on the questionnaires analyzed in the previous chapter, we selected 5 groups of 5 questions each, in order to reveal what motivates the students in our university in terms of their habits and self-confidence:

- The firmness wherewith they deal with those around them.
- The rationality they demonstrate in critical moments.
- Obedience to others.
- The compassion they manifest.

- The attitude of giving orders.

Table 1 reveals some correlations between the statements "I firmly tell people how to behave" and "People do what I say", which means that the 150 students display this attitude towards the others because the environment in which they carry out their activity accepts this. "I firmly tell people how to behave because they do what I say". Instead, the calm attitude in crisis situations, the systematic and logical working style does not make students firm in the attitude they adopt.

Table 1. Group correlations 1 (Source: personal questionnaire processing)

	I firmly tell people how to behave.	I can keep calm in a crisis situation.	My working style is systematic and logical.	People complain that I behave like a boss.	People do what I say.
I firmly tell people how to behave.	1				
I can keep calm in a crisis situation.	0.013448	1			
My working style is systematic and logical.	0.129364	0.29855	1		
People complain that I behave like a boss.	0.238888	-0.07111	-0.03846	1	
People do what I say.	0.341471	0.089513	0.097471	0.299891	1

Table 2. Group Correlations 2 (Source: personal questionnaire processing)

	I have the tendency to weigh things rationally before acting.	I like to solve problems systematically and logically.	I am not afraid to tell people what I feel.	I ask many questions, so I am curious.	I am appreciated for my calm attitude and my observations are judicious.
I have the tendency to weigh things rationally before acting.	1				
I like to solve problems systematically and logically.	0.394265	1			
I am not afraid to tell people what I feel.	0.102851	0.223247	1		
I ask many questions, so I am curious.	0.01619	0.085885	0.321691	1	
I am appreciated for my calm attitude and my observations are judicious.	0.147586	0.20356	0.059066	0.051128	1

Table 2 shows that the students who weigh things rationally before acting do so because they are happy to solve problems systematically and logically. Curiosity does not cause them to act rationally; on the contrary, there is no correlation between these two statements. The appreciation of those around them for their calm attitude and judicious reasoning motivates them very little to think rationally before acting.

Table 3 shows that the students in our university do not accept the others' "orders" because they want to be with other people; because they are too emotional or because they always wait for directions, they accept too easily what they are told.

Table 3. Group correlations 3 (Source: personal questionnaire processing)

	I do what I am told.	I like to be with other people.	Compared to others, I am too emotional.	I expect my boss to tell me what I have to do and how to do it.	I accept too easily what others want.
I do what I am told.	1				
I like to be with other people.	0.005402	1			
Compared to others, I am too emotional.	0.227093	0.106505	1		
I expect my boss to tell me what I have to do and how to do it.	0.234262	0.042289	0.332558	1	
I accept too easily what others want.	0.31607	0.142317	0.341564	0.20843	1

Table 4. Group correlations 4 (Source: personal questionnaire processing)

	I sympathize with people who have problems.	When we have a new colleague, I try as much as I can to show him/her all she needs to know.	I worry too much about people.	I stimulate people to test their own capacities.	I took care even of people who could manage by themselves.
I sympathize with people who have problems.	1				
When we have a new colleague, I try as much as I can to show him/her all she needs to know.	0.114102	1			
I worry too much about people.	0.43949	0.23161	1		
I stimulate people to test their own capacities.	0.137693	0.310805	0.075029	1	

	I sympathize with people who have problems.	When we have a new colleague, I try as much as I can to show him/her all she needs to know.	I worry too much about people.	I stimulate people to test their own capacities.	I took care even of people who could manage by themselves.
I took care even of people who could manage by themselves.	0.243341	0.093854	0.219866	0.122298	1

Because they care for others, students are compassionate with those around them, and there is a direct correlation between these two statements, as shown in Table 4. However, when they have a new colleague and they should help him/her, they do not strive to do this, for fear that someone knows more or that someone can take their place.

Table 5. Group correlations 5 (Source: personal questionnaire processing)

	I tell people what to do.	When I know that I am right, I insist that the others listen to me.	I am very passionate about my work.	People say that I am creative and inventive.	I rather take the control than being led by others.
I tell people what to do.	1				
When I know that I am right, I insist that the others listen to me.	0.185351	1			
I am very passionate about my work.	-0.14301	0.100468	1		
People say that I am creative and inventive.	0.229581	0.113722	0.02248	1	
I rather take the control than being led by others.	0.209232	0.197852	-0.04392	0.190217	1

Table 5 shows that students prefer to be decision-makers and not be led by others; that is why they often tell people what to do. When the enthusiasm for their activity grows, the desire to give orders decreases, and when they receive praise for their creativity and inventiveness, they feel justified to show people the "correct way."

Conclusions

"To be nobody but yourself in a world which is doing its best, night and day, to make you everybody else - means to fight the hardest battle which any human being can fight; and never stop fighting".

People hear 1% of what you say and 99% of what they are interested in. Many people have the impression that they communicate, but, in fact, they do not. Real communication can only exist between two or more authentic people who leave the masks aside and let the message be transmitted from the essence of their own being and receive the others' message in the depths of their being.

Communication is not just about what we are saying; it is far from it. What we say comes from what we are. Authentic communication is all we need. We only need to express ourselves, and what we say is a flimsy part of this self-expression.

"We become what we think we will become". When we are convinced that we can reach a goal, we begin to work towards it.

Perception is the process through which we understand the environment and respond to it by extracting the information that corresponds to our reference system, filtering what does not fit. The opinions built without facts or before knowing the facts are nothing but prejudices. Deductions and assumptions occur throughout the perception process and overcome gross information; they guide us and influence our behavior, rely on previous (cognitive) perceptions and information and sometimes lead to deformations and imprecision (Mucchielli, 2014).

Praise and criticism are two ways of giving feedback in teaching. It is very important for a teacher to be an example for his/her students and help them develop and find their own way. A brief remark from a professor, whom s/he respects, can convince a student of the skills s/he has (Pease & Pease, 2013).

In everyday life, people listen to less than 25% of the spoken messages that they receive. Immediately after receiving the message, a normal listener remembers only 50% of the received information, and 48 hours later s/he retains only 25% of the incoming messages in the active memory.

A person's life consists of 18-year cycles. In each cycle, certain characteristic needs are met. If at the respective time the need that had to be met was not met, this need will be fulfilled in the next training cycle, during the same period (current age - 18 years = the training stage period).

The students' average communication style (i.e. the students' predominant communication style) is represented by the Free Child state, followed closely by the Adult and the Nurturing Parent state. This means that among our university students, an amused and unstable attitude predominates, the students being very relaxed, but also spontaneous and disinhibited, energetic and uncontrollable; this predominant behavior is manifested especially in the first year of study. Likewise, these students also display the attitude of "here and now", but they are always careful and caring about those around them.

Only 2% of the analyzed students display as dominant ego state, the Adaptive Child state. This means that 3 out of the 150 students display a submissive and shameful attitude; they are sad and sometimes they have a defiant tone because their motto is "I cannot do it" – which is an encouraging result.

We think that there should be more creative and inventive students, more Free Children, with a positive attitude towards everything that surrounds us. We believe that 47 students display a predominantly communicative style – the Free Child; however, these are too few for a balanced university system. In most cases, the educational system restricts, limits the students' ability to manifest themselves as they wish. This situation teaches students to observe some rules, to be rewarded with grades for their intelligence, not for their creativity. We believe that emotional intelligence is poorly developed in the current educational system, and this situation cannot entail the formation and training of excellent leaders.

The students in our university do not accept the others' "orders" because they want to be with other people, but because they are too emotional. They accept too easily what they are told, and they always wait for directions.

According to Aristotle "We are what we do repeatedly. Excellency is therefore not an act but a habit."

Abstract. No doubt, information technology has provided the banking sectors with the capability to provide speedy and reliable banking services. However, ICT is believed to be a two-edged sword which offers tremendous benefits to the organization and also responsible for inducing stress amongst employees. This type of stress is referred to as technostress. Technology has created a knowledge gap for employees because of task reengineering, increased workload, multi-tasking, work-family conflict. Researches have demonstrated that technostress can affect an employee's performances, job satisfaction, and organizational commitment. However, the relationship between technostress job design and employee engagement has not been examined. Using the job characteristic model and social exchange theory this present study has examined the relationship between technostress, job design, and employee engagement. Data was collected from 319 individuals working in the Nigerian commercial banks and data was analyzed using smart PLS. The result indicated that job design has a significant influence on technostress, and technostress has a significant influence on employee engagement. Contrary to our proposed negative relationship based on job design, employee engagement and stress literature in which negative relationship is expected between job design and stress, stress and engagement, the result of this study revealed a positive relationship between job design and technostress is an indication that job design alone may not be able to moderate the effect of technostress if technological elements of job design is not addressed. While technostress does not necessarily reduce employee engagement but a moderate level of stress can serve as a motivator while extreme stress can demotivate employee. Additionally, the result of the study shows a positive relationship between job design and employee engagement and technostress mediates the relationship between job design and employee engagement.

Keywords: *Technostress; Job Design; Employee Engagement; Information Technology; Banks.*

Introduction

Today's business atmosphere is incredibly dynamic and has undergone fast changes as a result of technological innovation. Particularly the banking industry of the twenty-first century operates in an exceedingly complicated and competitive atmosphere characterized by these ever-changing conditions and extremely unpredictable financial climate. The application of technological innovation in the services and operations of banks has become an issue of fundamental importance and prerequisite for global competitiveness (Oluwagbemi, Abah & Achimugu, 2011). Despite the advantages of using technology, scholars believed that technology is a double-edged sword because it is responsible for inducing stress in the lives of its users (Tarafdar, Bolman Pullins & Ragu-Nathan, 2014). This kind of stress is referred to as technostress a kind of stress that is caused as a result of the inability of employees to cope with the use of technology in a healthy manner (Ayyagari, Grover & Purvis, 2011). A growing body of organizational researches has been concerned about identifying precursors and effects of technostress on employees and organizations. Already published studies have shown that technostress can affect employees job satisfaction, performance, organizational commitment and employee intention to extend the use of ICTs. (Ayyagari, Grover & Purvis, 2011; Tarafdar et al., 2014; Ahmad, Amin & Ismail, 2009).

Nevertheless, numerous researches have investigated technostress in several contexts, some studies (Tarafdar et al., 2014; Fieseler et al., 2014; Weiner Maier, Laumer & Weitzel, 2014; Kumar et al., 2013; Rajput et al., 2011;) have examined the impact of technostress on professionals (supply chain managers, IT professionals, sales, etc.) Telemedicine (Yan, Lee & Vogel, 2013) and on Smartphones. there is a limited study on technostress in Nigeria, particularly in the commercial banking sector. Likewise, previous researches have mainly focused on a few causes and effect of technostress, nevertheless, they have neglected the effect of job design on the perception of technostress. The nature of Job design and characteristic can determine employees' stress level (Jacobs et al., 2014), thus, it is vital to examine how job design can collectively influence technostress amongst banking employees in Nigeria. Giving the competitive nature of the banking industry in Nigeria, new technology-based products and services are constantly created. Furthermore, the effect of technostress on employees' engagement has not been examined, past researches have shown that stress can affect an employee's engagement. This gap limited our understanding of the causes and effect of technostress on employees and organizations. Understanding the relationship between job design employee engagement and technostress would provide a more practical intervention and strategies to alleviate the impact of technostress on employee engagement. To fill these gaps this study has integrated job design and employee engagement into the technostress research model. Job design represents organizational-based factors that influence technostress and employee engagement. Next we present our literature review, structural model and hypothesis, sample, methods and results, and lastly, conclude with theoretical and practical implications of our findings.

Figure 1. Research model

Literature review

Technostress

The terminology technostress was first used by Brod, (1984, p.16). He defined technostress "a modern disease of adaptation caused by an inability to cope with the new computer technologies in a healthy manner". Accordingly, Arnetz and Wiholm (1997) referred to technostress as "a state of arousal" prominent in employees who depend on computers for their routine task. Although prior researches on stress concentrated on the physical consequences technostress in organizations, such as fatigue, irritability headache, and restlessness (Arnett & Wiholm, 1997). While the current research has concentrated on the psychological states that create technostress by differentiating between the causes of stress (stressors) and the outcome of stress (strain) (Suh & Lee, 2017). The technostress model is composed of the five technostress creating conditions. Foremost, is "Techno-overload" "that portrays circumstances whereby utilization of ICTs increases employee's workload and compel them to work faster (Suh & Lee, 2017). Attempting to accomplish additional in less time, and encountering pressure and nervousness. Techno-overload can be seen in multi-tasking, especially in the banking job, were employees utilizes a variety of banking application simultaneously.

Second is "Techno-invasion" that depicts circumstances in which employees can presumably be reached anywhere and no matter the time and feel they must be continually connected (Tarafdar et al 2015) especially in baking were employees email official are connected to employees' mobile phones. It also connotes a situation in which working hours spills into an individual personal time because of persistent availableness, which results in work-family conflict (Tarafdar, Tu, Ragu-Nathan & Ragu-Nathan, 2011).

The third is "Techno-complexity", a complex system is a system with high functionalities, and the higher the functionalities, the higher the level of technostress. Techno-complexity portrays circumstances whereby ICT sophistication compels banking employees to invest time and energy in learning and re-learning how to utilize new banking applications. Employees may perceive the assortment of functions and application complex and be exhausting to grasp, and therefore feel stressed (Tarafdar et al., 2011). The fourth is "Techno-insecurity" that rises in circumstances wherever workers feel destabilized by the fear of losing their jobs to people who have a superior comprehension of latest Technology. Techno-insecurity is (Tarafdar et al., 2011). Last of

all is "Techno-uncertainty" that alludes to settings whereby constant changes and upgrades of Information technology and applications do not permit employees or users to accumulate knowledge and expertise for a particular system or application. They consider this unsettling because their skills and knowledge will become obsolete because of the technological pace of change result in frustration and perceived inability to cope thereby resulting in fear of been replaced (Tarafdar et al., 2011).

Job design and technostress

Job design in the context of this study is based on the Job Characteristics Model (JCM) by Hackman and Oldham (1980) which propounded the five essential job characteristics that motivate employees. These characteristics include; firstly, task variety, which is described as the degree to which a task involves a variety of skills to be accomplished or the extent expected an individual perform multiple functions. For instance, a bank teller job requires varieties of skills, because they provide banking services such as receipt and payment of cash, selling bank drafts, traveler's checks, attending customers inquires, booking of investments and loans. The second is task identity, is the extent to which an individual can start and complete a task individually, for example resolving a customer's complaint. Third is task significance, it the level of impact a job has on the lives of people. Employees may find fulfillment from their jobs when it changes or improves the wellbeing of others e.g. when a bank offer approves loans for small business and the recipients are able to grow their businesses and improve their living standard. Fourth is task autonomy, is the degree to which an employee can make decisions on how they want to perform their task. Task autonomy is often very low in banking jobs because various transactions need to go through oversights to prevent fraud and financial losses. Lastly is task feedback, it is the extent to extent to which an employee receives accurate and timely information regarding their task performance.

Furthering the thought on the relationship between job design and technostress, these five basic components of job design are expected to elevate positive attitudinal and behavioral outcomes. An employee with a low level of any of the above-mentioned job design characteristic is more likely to experience misfit between them and their job which can lead to technostress, thus affecting employee job satisfaction vice versa. For instance, the Humphrey et al. (2007) meta-investigation demonstrated that job characteristics (e.g., autonomy, working conditions, feedback, task identity,) were associated negatively and in a direct manner to the results of stress and fatigue. These outcomes propose that working under poor conditions and on job low on the motivational attributes can antagonistically affect worker psychological well-being. (Alam Sageer, 2012). In other words, lack of autonomy, skill variety, task significance, task identity, task feedback can amplify the perception of technostress. Giving the nature and structure of banking task, there is limited, task identity, task autonomy, were a single employee is not allowed to initiate and complete without going through the process of verification by various line officers through technology interdependency. thus, the sense of task identity is not present. This situation may amplify the perception of technostress amongst employees. Therefore, we proposed that following hypothesis:

H1 Job design is negatively associated with technostress

Technostress and employee engagement

The variable employee engagement was at first defined by Kahn (1990) "the harnessing of organizational members 'selves to their work roles" (p.694). What is central in Kahn's (1990) viewpoint is the measure of vitality and sense of commitment that employees have for work, and the manner in which they are heterogeneously actuated, amid such a setting, employee who is engaged is vigorously and viably associated with their work, as they are physical, psychologically and sincerely involved (Tims, Bakker & Derks, 2013). On the other hand, disengaged employees are emotionally separated with work and associates and even physically less involved" (Truss et al., 2013). In this present study employee engagement is based on Saks (2006) components of employee engagement. Accordingly, Saks (2006) divided employee engagement into job engagement and organizations engagement. Furthering the thought on the relationship between technostress and employee engagement Researches Kahn (1990) proposed emotional, physical and psychological resources are an essential precondition for engaging at work. This implies that is those physical and emotional resources can be depleted due to technostress, that means employees may become disengaged. Contrarily, disengaged employees detach themselves from work physically and withdraw emotionally and cognitively and resulting weak role performance and effortless, robotic task performance behaviors (Ongori & Agolla, 2008). Therefore, we argue that technostress is theoretically related to employee engagement. Stress literature commonly proposed a negative relationship between work-related stress and employee engagement (Velnampy & Aravinthan, 2013) which imply an excessive level of technostress decreases employee engagement. Therefore, we hypothesized as follows:

H2 Technostress is negatively related to employee engagement

Job design and employee engagement

According to Michael Armstrong (2003), "Job Design is the process of deciding on the contents of a job in terms of its duties and responsibilities, on the methods to be used in carrying out the job, in terms of techniques, systems and procedures, and on the relationships, that should exist between the job holder and his superior subordinates and colleagues. Job design in this present study is conceptualized based on the Job Characteristics Model (JCM) proposed by Hackman and Oldham (1980). JCM Posit that a job should contain the five job characteristics which include task feedback, job autonomy, skill variety, task identity, task significance and skill variety. Supporting the thought on the relationship between job design and employee engagement Prominent scholars of employee engagement literature has emphasized the role of job design in promoting employee engagement. For instance, Kahn's theory of engagement (1990) is derived from Hackman and Oldham's theory (1980) that characteristics of jobs affect an employee's attitudes and behaviors. Kahn (1990) argued that the nature of job design precondition for the extent to which employees would engage with their work. In associate anthropology study, he found that once individuals were doing work that was difficult and varied, they were a lot of probably to be engaged (Shantz, Alfes, Truss & Soane, 2013). Similarly, Bakker and Demerouti's (2007) job-demands-resources (JDR) model additionally highlights the importance of job design in creating engagement. Predominantly, the model argued that organizational, physical and social facets of a job may be associated with engagement. This because jobs design can result of the

availability of job resources that can buffer excessive work demands, thereby enhancing the achievement of organizational goals, and encouraging personal development and learning (Bakker & Demerouti 2007). The relationship between job design and employee engagement is supported by the social exchange theory. According to the social exchange theory, the relationship between an organization is based on the exchange rules (Shantz et al., 2013). An organization can only get what it gives, that is to say, when a job is enriched with job autonomy, task feedback skill variety, task significance and task identity, employees will reciprocate in form of job and organizational engagement. Therefore, our third hypothesis is as follows;

H3 Job design is positively related to employee engagement

The mediating effect of Technostress on Job design and employee engagement

In other, for scholars to test for mediating the relationship between independent and dependent variables, it requires three criteria (Alias, Noor & Hassan, 2014). Firstly, there ought to be a direct association between the independent variable and the dependent variable, secondly a directed association between the independent variable and the mediating variable and thirdly a direct association between the mediating variable and the dependent variables (Alias, Noor and Hassan, 2014). Drawing from the first criteria, it has been established that job design is positively related to employee engagement, the meta-analysis by Humphrey et al. (2007) and a study by Saks (2006) both found a positive relationship between the five facet of job design, Job autonomy, task feedback, task significance, skill variety and task identity and employee engagement. More recently, the study by Shantz, Alfes, Truss and Soane (2013) revealed that employees whose jobs offer high levels of task variety, autonomy, task feedback significance are more likely to be highly engaged. Also considering the second criteria, on the relationship between technostress and employee engagement, a study by Alarcon and Edwards (2011) engaged employees generally gain sufficient job resources. Abundant resources can reduce stress brought by job demands, which is negatively related to job satisfaction. Lastly based on the third criteria, on the relationship between job design and technostress, recent studies by Suh and Lee (2017) revealed that job characteristic jointly induces technostress. Thus, the fourth hypothesis is formulated as follows:

H4. The relationship between job design and employee engagement is mediated by technostress

Methods

Measures

This study adopted existing validated scales. All items were measured on a five-point Likert scales, that ranges from "strongly disagree to strongly agree". The independent variable in this study is job design (skill variety, task identity, task significance, task feedback and job autonomy) was measured by 15 items adapted from Pee and Lee (2015) as unidimensional. To measure the mediating variable technostress, three out of the five dimensions was selected (techno-overload, techno-complexity and techno-invasion) and was measured by 14 items adapted from Tarafdar, Pullins and Ragu-Nathan (2014) as unidimensional. Lastly, the dependent variable employee engagement

was measured by 11 items adapted from Saks (2006) measuring job engagement and organizational engagement. All dimension was combined and measured as unidimensional to provide the greatest basis for theory and construct validation test. (Smith, McCarthy & Zapolski, 2009) Likewise, it increases the precision of the understanding of the phenomenon of technostress and its relationship with Job design and employee engagement. Smart PLS 3 was utilized for data analysis because of its ability to measure complex model.

Data collection

The data for this study was collected from 319 front desk employees working in Nigerian commercial banks. A self-administered questionnaire was used and data was collected within the space of 5 months. A total of 400 questionnaires was distributed only 338 questionnaires was retrieved and 19 questionnaires were removed because of the error of omission.

Result and analysis

Data were analyzed using the partial least square (PLS) technique of analysis (Hair et al., 2016) to test the research Model. PLS is a second-generation SEM technique that can be used to estimate loadings of indicators on the constructs and the casual connections between constructs in a complex model. Accordingly, in comparison with the SEM techniques, PLS can be used to measure small samples (Hair et al., 2016) which is the case in this study that is why PLS was considered.

Measures reliability and validity

Confirmatory Factor analysis (CFA) was used to examine the reliability and validity of the measures adopted from the literature. The result's given in Table 1. To examine the reliability of the measure, we utilized the inter-item consistency reliability of the Cronbach's alpha. the worth ranges from 0.847 to 0.872 which is above the specified threshold 0.7 suggested by Nunnally and Bernstein (1994). Furthermore, convergent validity that demonstrates the extent to which the multiple efforts to measure a related concept ought to be connected was conjointly examined. Hair et al. (2012), suggested that composite reliability, factor loading and average variance extracted should be utilized to examine the convergent validity. Composite reliability ranges between 899 to 918 that is on top of the counsellor price of zero.7 by Hair et al. (2010). The loading for all the indicator exceeded the suggested value of 0.6 (Chin et al., 1997). the average variance extracted, that the overall quantity of variance among the indications ranges from 506 to 528 which within the specified threshold value of 0.5 by Hair et al. (2010). to boot, discriminant validity is examined by comparison the squared correlations between constructs and variance extracted constructs (Fornell & Larcker, 1981). As given in Table two, the square correlation for individual construct is smaller than the average variance extracted by the indicators measuring the construct, that indicates adequate discriminant validity.

Table 1. The Result of CFA for measure model

Construct	Item	Internal reliability Cronbach's alpha	Factor loading	Convergent validity composite reliability	Average Variance extracted
Employee engagement	EE-JOB_5	0.860	0.714	0.891	0.506
	EE-ORG_6		0.643		
	EE-ORG_7		0.763		
	EE-ORG_9		0.798		
	EE-OR_10		0.699		
	EE-OR_11		0.715		
	EE=ORG_8		0.694		
	EE_JOB_3		0.654		
Job Design	JD-JA_1	0.872	0.711	0.899	0.528
	JD-JA_2		0.750		
	JD-JA_3		0.687		
	JD-SV_2		0.742		
	JD-SV_3		0.710		
	JD-TI_1		0.788		
	JD-TI_2		0.663		
	JD-TI_3		0.752		
Technostress	TS_1	0.847	0.791	0.884	0.522
	TS_3		0.794		
	TS_4		0.659		
	TS_5		0.732		
	TS_6		0.639		
	TS_7		0.754		
	TS_9		0.673		

Note: A Composite reliability = (square of the summation of the factor loadings) / {(square of the summation of the factor loadings) + (square of the summation of the error variances)}
 b Composite reliability = (summation of the square of the factor loadings) / {(summation of the square of the factor loadings) + (summation of the error variances)}

Table 2. Discriminant validity of constructs

	Employee engagement	Job design	Technostress
Employee Engagement	0.712		
Job Design	0.725	0.726	
Technostress	0.542	0.516	0.723

Note: the figures highlighted represents the average variance extracted while the other entries represent the squared correlations.

Table 2 presents the result of the discriminant validity. We utilized the two test for discriminate validity. Firstly, the contrast of the item loadings with items Crosses loading and the comparison of average variance extract. Each item should load higher on its intended construct than on the lower construct (Hair et al., 2015). We found that all our items satisfied this conditions (see table 2 and 1) Secondly, constructs variance extracted or shared variance between the constructs and the items should be greater than the shared variance amongst the construct and other constructs. This was measured by equating the square root of the construct's average variance extracted (AVE) to its connection with other constructs. For each construct, result established that the square root of the AVE is significantly larger than its correlation with other constructs (see table 1). Thus discriminate validity is established.

PLS structural model

Model fit

Having established the discriminant and convergent validity of the constructs, we verified the overall structural model. Generally, our proposed model has a good fit for the data. The result is presented in Table 3.

Table 3. Model Fit indices

Fit Index	Study	Recommended value	Source
SRMR	0.9	≥ 0.10 or of 0.08	Hu and Bentler, 1999)
d_ULS	2.5	≥ 0.05	Dijkstra and Henseler (2016)
d_G1	0.1	> 0.05	Dijkstra and Henseler (2016)
d_G2	0.1	> 0.05	Dijkstra and Henseler (2016)
Chi-Square	2.294		
NFI	0.6	≥ 0.9	Dijkstra and Henseler (2016)

Table 3 showcases the model fit index. There are numerous tests of model fit. When conducting a model fits test, it is important to define the approximate model. The only approximate model fits measure by PLS path modelling is that the standard root of mean square residual (SRMR) and NFI The SRMR is represented the dissimilarities between the experiential correlation and the model inferred matrix. SRMR price of under zero.10 or of 0.08 is considered as a good fit (Hu & Bentler, 1999). In this present study, the SRMR value is 0.09 and NFI 0.5. Thus, the model fit has been established.

Structural Model Result

The overall structural model of the was measured by calculating the extent of variance explained by the independent variable and the altitudes of the strength of its paths and the extent of correspondence of each of our hypothesis to a specific structural model path. We used the R^2 to measure the model exploratory ability. Synonymous with the description of the regression analysis, the variation is anticipated to exceed 10% to qualify for an experimental study. The result confirmed that the independent variable explained above 20% variance. Has specified in table 5, employee engagement $R^2 = 0.564$ and Technostress $R^2 = 0.265$ demonstrate that Job design explains a substantial sum of the variance in technostress and employee engagement. Thus, this result offers a support for H1, H2 and H3 (See table 4).

Table 4. Path coefficient Result

	Mean	STDEV	T-Value	P-Value
Job design-> Employee engagement	0.608	044	13,950	0.000
Job design -> Technostress	0.517	046	11,137	0.000
Technostress -> Employee engagement	233	049	4,700	0.000

Table 4 presents the synopsis of the path relationship in the model. The relationship between job design and employee engagement is highly significant, the mean value = 0.608 and t-value =13,950. Thus hypothesis 1 is supported. Additionally, there is a significant relationship between job design and technostress, the mean value is = 0.517 and t-value =11,137, therefore, providing support for hypothesis 2. Lastly, the relationship between technostress and employee engagement is significant, the mean score =233 and t-value= 4,700, hence hypothesis 3 is supported.

Table 5. Indirect effect

	Mean	STDEV	T-value	P-value
Job design-> technostress -> employee engagement	0.120	0.028	4,196	0.000

Table 5 present the result of the indirect effect. The mean score = 120 and the t-value = 4,196, thus mediating effect of technostress on job design and employee engagement is established.

Discussion

The major objective of the study is to examine the how job design (job autonomy, skill variety, task identity, task significance and task feedback) jointly influence banking employees' technostress and engagement and the influence of job design on employee engagement. Researches have shown that Poorly designed job can serve as a source of stress in itself and can influence employee engagement. Additionally, technostress can influence the level of employee engagement, while job design can also influence the level of employee engagement. The findings of the study are as follows.

Firstly, Job design (job autonomy, skill variety, task identity, task significance and task feedback) conjointly explained techno- stressors (sources of strain). Job design had positive significant by increasing technostress instead of reducing the effect of technostress as suggested by job design and stress literature. This result shows curvilinear relationship or inverted "U" between job design and technostress contrary to the dominant trend in the job design and job stress literature and posits a one-way directional relationship in which job design is negatively related to job stress. No doubt, job design is significantly related to technostress and can reduce the impact of technostress on employees. However, job design alone may not be able to mitigate the effect of technostress if the job context or hygiene factors (e.g. banking policies, pay salary, working hours, supervision, and interpersonal relationship) and technological aspect of a job are not addressed. Therefore, management needs to consider sociotechnical elements of job design when redesign task.

Secondly, the result shows that technostress has a strong influence on employee engagement. According to work stress and employee engagement literature, work stress is negatively related to employee engagement. The result of this study is contrary to the theorized relationship. The result reflected a positive relationship between technostress and employee engagement. This means the outcome of technostress or stress most not necessarily be negative. The presence of stress could serve as a motivating factor. This is supported by Yerkes-Dodson law proposes that the height of performance is attained when people experience a moderate level of work pressure. Similarly, Schmitt et al.

(2016), based on the activation theory, submit that time pressure and work engagement have a curvilinear relationship. This is also an indication that banking employees in Nigeria are exceedingly engaged or they are stressed-engaged employees. On the other hand, it can be said that because banking employees are exceedingly engaged they find it easy to cope technostress. The engaged employee often gains more job resources, which help them to overcome stress on the (Schaufeli & Bakker, 2004).

Thirdly, hypothesis 3 which proposes a positive relationship between job design and employee engagement is highly significant and supported, the mean value = 0.608 and t-value = 13.950. This finding is consistent with the findings of previous studies on job design and employee. Past researches on engagement have shown that employees whose possess high task autonomy, task significance, task identity, task feedback and skill variety are more engaged (Shantz et al., 2013).

Practical implication

The first practical implication of this study is that organizations and management should note that despite all the advantages associated to the use of technology in workplaces, technology could induce stress in the lives of employees, which can affect performance. The first practical implication of the present study is the importance of Job design (task feedback, job autonomy task identity, skill variety and task significance in alleviating the impact of technostress on employees, however, the present findings may be of particular interest to practitioners given that we found a positive relationship between job design and technostress. The result shows that job design alone may not be able to mitigate the effect of technostress if the job context is or hygiene factors (e.g. banking policies, pay salary, working hours, supervision, interpersonal relationship) and socio-technological aspects (Task-technological interdependency, system failure and poor IT infrastructure) is not addressed. Thus, management and practitioners should always consider the socio-technical (social and technical) aspect of job design.

The second practical implications of this study are that management should make employee engagement one of its top priorities because employee engagement is related to various organizational outcomes. Employee engagement can assist employees to deal with stress brought about by excessive job demand. Even though we proposed a negative relationship between technostress and employee engagement in line with the proposition by stress and engagement literature, our result revealed a positive relationship between technostress and employee engagement contrary to the negative relationship posit by stress and engagement. It shows that the outcomes of technostress may not always be negative if employees are highly engaged. According to the Yerkes-Dodson law state that the height of performance is attained when people experience a moderate level of work pressure Nevertheless, a low and very high level of time pressure de-motivates workers from work (Schmitt et al., 2015). Likewise, job design is an essential element of ensuring employee engagement. Therefore, management should ensure that jobs are designed based on the five core job characteristics.

Implications for research

Our studies contribute to technostress studies in two essential ways, first we examine for the first time the job design as an antecedent of technostress combining the five job characteristics proposed by Hackman and Oldham into a single model, shows that autonomy, skill variety, task identity, task significance and task feedback are positively

related to technostress, unlike Suh and Lee (2017) who utilized selected job characteristic and measure with selected technology characteristics instead of technostress. Second, our study examined for the first time the relationship between technostress and employee engagement and we adopted the unidimensional approach to measuring employee engagement importantly to provide the greatest basis for theory and construct validation test. (Smith, McCarthy & Zapolski, 2009) Likewise, it increases the precision of the understanding of the phenomenon of employee engagement and its relationship with technostress.

Limitations and future research

Despite the intriguing finding of our study, parallel to other studies in this area (Suh & Lee, 2017; Tarafdar et al., 2015; Jena, 2015; Fuglseth & Sørenbø, 2014; Yan et al., 2013; Ayyagari et al., 2011; She et al., 2011). This study used a cross-sectional and self-reported data. This limits the conclusions that we can make about causality and raises concern for common bias. Additionally, there may be sample biases because survey respondents are from Nigerian commercial banks, therefore results may not be generalized across different countries and industries, hence future research can replicate this study in another country and industry using longitudinal study. Future research may also expand the technostress-job design and employee engagement model, by including the social and job context characteristic of job design (e.g. banking policies, career development, working hours, supervision, interpersonal relationship).

Abstract. *This article reveals a conceptual framework about the importance of aligning Strategic Human Resource Management (SHRM) and its impact on organizational learning, as well as organizations culture that proposes some perceptions on how knowledge might occur at the organizational level to improve organizational excellence, i.e. Knowledge Skills and Abilities (KSAs). Research indicates that there are a number of studies that advocate the impact of SHRM and its influence on an organization that enhances an organization's capability and enables them to improve their organizational competency, i.e. excellence. Yet, on that point are some rare linkage between SHRM and sustainable organizational cultural practices that can provide a unique perspective to develop organizations effectiveness and spread out its excellence through prerequisite academic condition, suitable working condition, and potential motivation. Thus, the main aim of this article is to put emphasis on several approaches of organizational culture and strategic HRM, by integrating knowledge from diverse areas of organizational studies including organizational learning, and the distinctive design of human resource practices. In view of literature, this article confers that the best practices for accomplishing and sustaining organizational excellence could be enriched through the organizational culture and academic work experienced in recent years. Finally, this article highlighted on some propositions that nowadays organizations are not only fulfilling the facility and linking functions but also rationalizing academic work in order to sustain their reputation and competitiveness of the organization as a whole that accelerates organizational performance and competitive ability.*

Keywords: *competitiveness; human resources (HR); strategic human resource management (SHRM); organizational culture (OC); organizational excellence.*

Introduction

In order to survive and achieve competitive advantages, nowadays, it is crucial to all organizations to be in a position to innovate and integrate the new knowledge that enables them to ensure sustainability of organizational learning through aligning organizational culture and performance development. Today, the strategic part of HRM practices, perceptions as well as organizational work culture which was integrated within the organization stated that the success of the organizational performance lied in developing positive attitudes of individuals, groups, and organizations that mainly enhanced individual competence as well organizational competence through organizational learning. Moreover, currently, organizations realize the significance of strategic HRM to build strong technical infrastructures along with strong organizational culture (which could be bureaucratic, competitive and supportive). As it facilitates the retrieval and dissemination of knowledge especially where human resources are responsible for empowering the effect of recent trends in organizations and protecting against the unwanted effects of globalization. Hence, both the approaches of organizational capacity development strategy, i.e. Strategic Human Resource Management (SHRM) and organizational culture have been viewed as a new perspective of enhancing organizational performance to sustain in long-run as well as to meet some of the global challenges.

The contemporary issue on strategic human resource management and organizational culture's positive effect of organizations excellence presents the general framework of the aforementioned research work. It begins with the theoretical basis for the development of a strategic HRM and strategic culture. Consequently, to address the debated issue, it is mandatory to highlight that since the beginning of 1980's, it has been observed that Human Resource (HR) experts (both the academic and professional) have been always under stress to augment on how to increase the competitive capacity of their organizations. In this circumstance, it also emphasizes the importance of increasing a strong culture within the organization which enables to enhance the organization's competitive strategy. Similarly, research also shows that during this transition period in the development of knowledge, the way by which those who possess this knowledge, i.e. employees are achieved can be considered as an important source of competitive advantage. Alternative, it can be said that strategic human resource management and organizational culture plays a vital role to heighten and maintain the level of performance and excellence of an organization. As, in today's competitive environment, organizational competency is continuously reflected on organization's culture and its HR practices, both of which influence the behavior of organizational members (Cabrera & Bonache, 1999, p.52). Relating to this issue, Chowa and Liu (2009) stated that organizational culture is one of the most vital aspects of the internal organizational environment that has a great influence on human resource management practices and its strategic activities. Similarly, several researchers (Yeung, Brockbank & Ulrich, 1991; Cabrera & Bonache, 1999) also emphasized that organizational culture is concerned with the symbols, rituals, social patterns and shared understanding of the employees that govern employee's individual as well as group behavior within the organization, which reflects on organizations competitiveness.

Consequently, to discourse the interdisciplinary discussions and considerations on the varied suitable ways for enhancing businesses, organizations competitive advantages, the European Commission (EC) took the initiative on investing in people and modernizing labor markets, as well as investing in knowledge and innovation and considered them as the most priority areas for the renewed Lisbon Strategy for Growth and Jobs in the EU market (European Commission, 2008). Where, significant efforts have been made to transform the global economy towards more knowledge intensive activities, in order to strengthen the single market, increase job mobility, reinforce education and training, and incentivize more private, investment in research and innovation Accordingly, in 2005 the Commission adopted the European Charter for Researchers and a Code of Conduct for the Recruitment of Researchers (European Communities, 2005) setting out the roles and responsibilities of employees (researchers) and their employers and investors, and ways to make recruitment fairer and more transparent. Being conscious of this new perspective of enhancing the European charter and Code (C&C), many organizations realize the relevance of strategic HRM to build technological infrastructures and organizational culture that allow them to reposition and attract talented researchers for the dissemination of knowledge. Where HR is responsible for empowering the effect of recent trends in organizations and shielding them against the unwanted effects. Hence, SHRM is viewed as an eminent approach to meet the global challenges.

Therefore, aligning the importance of SHRM in relation to organizational culture and organizational performance development is noteworthy in this growing research interest in the field of organizational capacity development, i.e. organizational excellence. Its growth is being inhibited by rapid contextualization of HRM, its diverse inherent values, assumptions, devotions, and philosophies which are taken to ensure granted as an essential aspect of an organization to boost the level of its performance. Research shows, that in spite of, growing research interest in the crucial arena of strategic human resource management (SHRM), the understanding of the relationship between HR, appropriate organizational culture and business strategy is still very limited and not much effective in reality. For example, it can be stated that how organizational culture and HR practices strategic activities can be aligned? How do they combine to strengthen an organization's competitive advantage? In this paper, this study reveals two aspects to organize the philosophy and concept of SHRM, i.e. underlying the significance of implementing C&C's principle and enhancing the organizational performance as well as accomplishing the organizational excellence through organizational learning. It introduces the notion of the organizational learning process and offers some insights into how learning might occur at the organizational level in order to enhance organizational competency. On the other hand, it includes all the aspects of people management and process which can provide organizations effectiveness and enhance organization's performance through the right people, culture and leadership, i.e. (changes in academic work, changes in recruitment, employment and working conditions, and academics' perceptions of their professional), the right organization design, concept to adopt change management and appropriate working conditions, i.e. (Performance-driven organization) and the right people processes for capability development, i.e. (employees' are potentially motivate).

Theoretical perspective of strategic human resource management (SHRM) approach

To address the consequence of SHRM in a research organization, it is obligatory to emphasize that currently organizations' have to face always competitive challenges and turn them into organizations opportunities. Henceforth, the human resource management function is expected to design, tailor, and implement efficient systems to help internal employees' positive operational strategic actions. In this perspective, the function of human resource management acts as a service provider having an effective toolbox to support other managers and help them to attain their objectives in line with the organizational strategic goals and orientation (Moustaghfir, 2014). According to Dermol and Rakowska, (2014) the concept of SHRM fits well with the conception of HR strategy due to its ability to create long-term value for the research organizations performance development. It tries to highlight that SHRM in an organization facilitates performance development as Storey (2001), identified that HRM is a distinctive approach to employment management which seeks to achieve competitive advantage through the strategic development of a highly committed and capable workforce. Where, they are using an array of cultural, structural and personnel techniques.

Similarly, it is necessary to refer that 'Human resource management' covers a vast array of activities and shows a huge range of variations across occupations, organizational levels, business units, firms, industries and societies' (Boxall, Purcell & Wright, 2007). Boxall discusses that the main characteristics of HRM can be: diverse (hard or soft); strategic; business-oriented; focus on mutuality – a state that exists when management and employees are interdependent and both benefit from this interdependency; take a unitary view – the belief that management and employees share the same concerns and it is therefore in both their interests to work together; treat people as assets or human capital. Furthermore, Su, Wright and Ulrich (2018), emphasized that over the past 20 years, the importance of strategic HRM generating higher organizational performance through better employee management which, has sparked great interest for researchers and managers. From the theoretical perspective of strategic HRM, Walton (1985) and Whitener (2001) represent the activities of human resource management (HRM) approaches can be categorized into two challenging sectors such as commitment and control. Concerning this matter, various scholars have a different opinion. Among them, Lepak et al. (2006), highlighted that the main aims of commitment approaches are to improve organizational performance by influencing employees' knowledge, skills, and abilities (KSAs); motivation; and opportunities to contribute. Whereas, the primary goal of the control approach is to escalate employees' competence as well as their level of performance through their compliance and conformity without alleviating company rules, regulations, and standard operating procedures.

The notion of organizational culture

The concept of organizational culture is not a new approach, it has a long tradition and it has come of age. While speaking about organizational culture, at first we need to know what is meant by culture from the academic perspective point? Precisely, culture can be considered as a "lens" through which we view the world. It depends on individual's observation, i.e. what we see, how we make sense of what we see, how we express ourselves. Moreover, the concept of culture is a long and varied history. Mainly, it has been used by the layman as a word to indicate sophistication. More precisely, can be said

that earlier culture has been used by anthropologists to designate the customs and rituals that societies develop over the course of their history (Schein, 2004, p.7). In the management literature, the existence of culture within the organization has often created some inferences, which shows that having a culture within the organization is necessary for effective organizational performance and that the stronger the culture, the more effective the organization.

The synergetic effect of strategic HRM, organizational culture and organizational excellence

The background of this study draws upon various approaches and concepts concerning the strategic HRM that integrating the significance of Human Resource Strategy for business strategy – a gateway to achieving organizational excellence. Consequently, it is necessary to mention that this concept of enhancing organizational competitive advantage, is one of the most noteworthy initiative of European Commission (EC), under the European Research Area (ERA) in order to make researchers' careers more attractive, i.e.(smart), and increase the job facility, as well as support the mobility of researchers by standardizing the researchers' careers in the EU under one umbrella. Hence research organizations performance development approach includes a strategy and active development attitude to effectively respond to the changes in its external environment. Cascio (2015, p.423) considers that actually strategic human resource management' (SHRM) is the replication of excellent, orientation, and integration of a research organization's HRM system. Where human capital resources can most effectively contribute to its strategic research objectives.

Fumasoli, Goastellec & Kehm (2015) noted that recently a growing diversity has been observed within the academic profession and new professional roles dwelling a space, which is neither positioned in the core business of teaching and research nor at the top level management and leadership. It explores the perceptions of academic staff and representatives of institutional leadership about the variations in academic careers and academic work experienced. Where, they emphasize the importance of standardization and differentiation of academic career paths, impacts of new forms of quality management on academic work, changes in recruitment, employment and working conditions, and academics' perceptions of their professional contexts. Bryson (2004), states that during the 1990's, especially the changes in the Higher Education (HE) organization have been observed profoundly particularly in the UK. The impact of these changes was mainly on the working environment and the employment of academic staff within the organization.

Figure 1. Aligning Strategic HRM and Organizational Culture on Organizational Excellence

To understand the synergetic effect of strategic HRM, organizational culture and organizational excellence, the above-mentioned Figure.1 illustrates the combined effort of organizational culture (OC) and organizational excellence (OE). Concerning this correlation, Qawasmeh, Darqal and Qawasmeh (2013) expressed that organizational culture is one of the most delicate means through which organizations can enhance and

achieve their excellence. In addition, they also emphasized that culture, have a strong influence on organizations overall performance. It doesn't matter whether the culture is strong or weak. Alternatively, organizational excellence is viewed as a continuing effort that all employees within an organization to make efforts to achieve. Therefore, organizational culture plays an important role in promoting organizational performance as well as enhancing organizational competitive capability in order to boost and sustain a long-lasting competitive advantage.

Understanding organizational culture and its relation to strategic HRM

In this changeover condition, the notion of 'human resource management' has become a key aspect of enhancing research organizations competitiveness through aligning organizational culture, which should be an integral factor when considering SHRM. Research shows that the significance of the association of HR along with the organizational culture both act as a source of competitive advantage that enables research organizations to enhance and influence on an organization's development strategy (Harrison & Bazzi, 2017). Moreover, from the scientific perspective point, organizational culture is perceived and considered as a principle that maintaining the connections with the mission, vision and a strategy, of an organization's structure and size, the management's activities, or functions within an organization (Kosiorek & Szczepańska, 2016). Similarly, Gupta (2011), also mentioned that organizational culture has a great influence in creating and maintaining a high performance oriented research organization effectiveness within the same culture and cross cultures.

Consequently, human resource management professionals use the term "strategic human resource management" to convey their thinking that effective strategic HRM contributes to organizations effectiveness. It also indicates the significance of their interrelationships with other elements comprising an organizational system, including elements in the organization's internal and external environment as well as the multiple stakeholders who evaluate the organization's effectiveness and determine its long-term survival (Jackson, Randall & Kaifeng, 2014). Several studies (Schein, 1990; Morris, Davis, & Allen, 1993; Zahra, Hayton & Salvato, 2004) recognized that organization's culture exemplifies the coherent pattern of values and beliefs that has evolved as successful solutions to past challenges. Furthermore, culture represents a significant relative aspect that can foster flexible knowledge-sharing behaviors of the employees within the organization, which is influenced by the strategic aspects of HRM (as cited in Hayton & Macchitella, 2013).

Figure 2. Strategic HRM and Organizational Culture's influence on Organizational Excellence

Figure 2 represents the inter-related effect of strategic HRM, organizational culture and organizational leanings collective strength that enables an organization to strengthen its organizational excellence (OE). It demonstrates that the way an organization can improve its level of performance through organizational skill development (Know-how), individual employee's skill development (human resources development) and group skill development (organizational competence) Concerning this co-relation, Saha et al. (2016) described that organizational performance development in relation with strategic HRM and organizational learning objectives which is the inter-related effect of both individual employee competency (performance) and organizational competency (top and middle management involvement) that leads to develop organizational success and performance indicators for sustainable development of competitive advantage. In spite of these references to a broader understanding about organizational performance in association with the dynamics of the top and middle management, Floyd and Wooldridge (1992) argue that middle management involvement in strategy improves performance by refining the quality of strategic decisions. Where these decisions in combination result in a superior organizational strategy development that empowers organizational performance.

Methodology

This study principally addressed the amalgamation of both empirical evidence and inductive reasoning of strategic HRM and organizational culture. The empirical argument represents the methods of gaining knowledge. Generally, inductive reasoning shows the level of sustenance in the form of probabilistic reasoning and the source of most scientific theories founded on the contemporary approaches of strategic HRM.

Definition of strategic human resource management used in this study

The definition of 'Strategic HRM' has been used in this research based on the impact of human resource management and human resource (HR) practices and its strategic activities, strategic planning, and skills on organizational capacity development. The primary aim of this study is not an examination of different scholar's opinion and disagreeing with the basis of organizational capacity development that has been moved

and examining the comparative relationship from organizational culture and its influence on organizational competitiveness. Where, HR strategies has become the major driving forces of business performance and the process that take into consideration such valuable assets which are managed, developed, and motivate a key core capability. The significances of this study marked the key dimensions and distinctive features of Strategic HRM and Organizational culture approach, its benefits and objectives of organizational learning, strategic HR practices among motivated performance-oriented organizations' different priorities, and characteristics that simplify the sustainable organizational learning and organizational effectiveness.

Results and discussion

This study was steered to describe the potential contribution of strategic HRM and its distinctive features that enable organizations to enhance their competitive capability (individual, group and organizational) and level of performance in relation to the implementation of organizational culture and organizational learning strategies, i.e. (know-what, know-why, know-how, and know-who). Conferring with the findings of evolutionary economics, organizational behavior and HRM literature have generally given a relative perspective to us about the theoretical aspects of SHRM and the key components of organizational culture which have a positive impact on organizational performance development and enhance competitive advantage. The below-mentioned Figure 3 exemplifies that HRM approach as a vital strategic driving force that raises sustainable organizational learning and improves the organizational performance. In addition, the presence of organizational culture components and attributes also enables organizations to meet the recent trends of business, which complement and facilitate the organizational capacity development strategy through active participation or involvement within the organization. Alternatively, strategic human resource management reinforces managerial skills such as individual, group, and organizational competence in an organization through improving organizational learning including individual, group, and organizational learning and human resources development which leads to promoting competitive capability and business growth due to their inherent competences.

Figure 3. Thematic Model of Organizational Excellence Enhancement in relation with Strategic HRM and Organizational Culture

To justify, the key elements of organizational culture's influences on organizations capacity development, it is also necessary to identify whether the strategic quality of HRM can really enhance the organizational excellence or not that encourage organizational performance augmentation (competence). It is essential to differentiate, whether organizational competence can be regarded as an important component for achieving the competitive advantage or not; whether organizational culture, its distinctive components as well as the strategic activities of human resources can really shield and strengthen the organizational coordination and consolidation (i.e. operational activities and managerial skills) or not; whether the initiatives provided by the HR system in the organizations are effective or not.

Regarding this issue, researcher (Schuler, 1992; Bowen & Ostroff, 2004; Chow & Liu, 2009) have observed that the value of strategic HRM and its impact on organizational effectiveness with the presence of organizational culture become more magnified as it enables organization's ability to create and maintain a link between the internal and external demands of an organization. In addition, the perspective of SHRM emphasizes the necessity to achieve coordination and integration between organizational culture, HR systems, a business strategy that influences on organizational performance.

Based on the issue of organizational culture and its impact on human resource management (HRM) leads to the recognition of two important research assumptions or RAs.

- RP1, emphasizes that organizational culture and strategic HRM practices are one of the most significant factors in organizational performance development, i.e.(excellence). Conferring, in this argument several scholars have numerous opinions. Among them, Chow, Teo & Chew (2013), Darwish, Singh & Mohamed (2013), Su et al. (2018) pointed out that there is a significant relationship between strategic HRM and organizational performance development. Concurrently, Colakoglu, Lepak and Hong (2006) also explained that to review the presentation of an organizational performance, there is no stable system that is existing. Actually, it depends on the inherent capabilities of prevailing human resources practices as well as organizational work culture within the organization in order to gain the competitive advantage.
- RA2 indicates that organizational performance in terms of individual, group and organizational competitive capability is achievable through organization's activities, especially, from the organizational cultural impact that based on shared values, belief, norms, and action-based perspective. This RA, mainly emphasized that individual employee's proficiency (KSAs) creates value through their individual creativity as well as the existence of a quality working environment (work culture). Saha et al (2016), highlighted that human resources management enables organizations or firms to understand the value of internal and external customers, competitors' knowledge, products, technology, and sources of competitive advantage. It is essential to ensure that the success of any organization which is based on the belief that an organization gains a competitive advantage by using its people effectively and efficiently.

Conclusions and implications

To conclude, it is essential to accentuate the fact that at the present time, the manifestation of strategic human resource management concept, as well as the significance of organizational culture, has been aligned with the perception of organizational performance development strategy. It is aimed at improving the efficiency and effectiveness of HR systems, organizational behavior and constitutes a standardized working environment, i.e. effective organizational culture according to C&C, which acts as a vital stimulant for attaining organizational excellence.

Finally, this study recommended that organizational capability development enhances internal commutations strategy in a relationship with the organizational culture and sustainable organizational learning. Therefore, to accomplish organizations effectiveness that enhances sustainable organizational learning; this study suggested some propositions which, shows that it is important for the HR strategy of the organization to be taken on a comparable alignment to ensure not only the organization's success but also its sustainability.

Therefore, there is a critical need for business leaders to assess their expertise (innovative skills and abilities) constantly to determine whether the appropriate expertise required to accomplish the business strategies exist within the organization or not; if not, then how is it possible to identify the skills for developing the current employees within the organization to perform better according to the level required for the organization to be competitive. To solve this problem about how organizations can successfully deal with an unpredictable and constantly changing environment, as the current study tries to provide some valuable insights.

Abstract. *The aim of this research paper is to identify and analyze the current trends and challenges within human resources management, especially in the recruitment and selection processes by using online social networks. The research is specifically focused on identifying the perceptions of human resources specialists regarding the use of popular online social networks in searching for talent, to investigate whether the use of special job recruitment platforms and human resources management platforms are useful for these endeavors. Within this research both perceived advantages and disadvantages of using online social networks as tools towards reaching the desired job are presented. From a methodological perspective, the research uses qualitative methods. The semi-structured interview was used for human resources professionals with more than 7 years of experience within the field, and with less experienced specialists. The research sample consisted of 12 participants between 23 and 45 years old. Considering the digitalization of human resources processes and the expansion of online social networks use within the recruitment and selection processes, the herein paper proceeds in exploring the nuances that appear in a competing environment. The interview analysis revealed that human resources professionals start developing a PR (public relations) and marketing mind-set considering the challenges that they are faced with in attracting a relevant pool of candidates on social media, but are also constrained by the limits imposed by the HR (human resources) norms within the organization. The HR professionals from our sample suggested that they are also getting involved in researching the online platforms where candidates spend most of their time and their efforts combined with the marketing objectives should reach desired results, when possible. The research findings are relevant for human resources activities and management considering the challenges these professionals face in understanding and grasping the new digital technologies.*

Keywords: *online social networks; human resources; recruitment.*

Introduction

Recruitment and selection processes have gained a lot of attention in the context of rising new information and communication technologies (ICT). The digitized and globalized society has allowed recruiters to extend their candidate resource pools, to simplify and improve the selection process of these candidates and to obtain high efficiency in the recruitment activity when considering both costs and time (Novac, 2009).

According to Eurostat (2017), almost half of EU-28 enterprises use social media for various activities, with online social networks being the most popular. Social media do not represent only social networks, as they refer mainly to every Web 2.0 platform that allows UGC (User Generated Content), collaborative sharing and connectedness, including: online forums, blogs, wiki projects, podcasts etc. (Kaplan & Haenlein, 2010). Various applications and uses of social media on behalf of organizations have been researched, especially focusing on how they help organizations from a marketing perspective (Kaplan & Haenlein, 2012), but there is still need for research as far as the human resources management (HRM) is concerned. Recruitment through LinkedIn and Facebook, or even through Amazon Mechanical Turk (Dworkin et al., 2016) allows organizations to identify potential candidates, but also to evaluate them (Sivertzen, Nilsen & Olafsen, 2013), even though this evaluation does not necessarily lead to decision making as far as the candidates' relevancy for the position is concerned (Ciochină, 2012). As Khullar and Pandey (2014) pointed, the human resources department demonstrates a dynamic role „of designing strategies for attracting talent digitally” (p. 216) and also safeguards the organization from potentially harming digital actions taken by socially active employees. Considering that human resources activities and management have been digitized, human resources professionals gain an even more important role in leveraging the relationship between the organization and its employees and between the organization and other external entities. Therefore, this research proposes the following research questions:

RQ1. How do human resources professionals use online recruitment and selection through social media?

RQ2. What are the future strategies for online recruitment and selection?

Theoretical background

Information and communication technologies and online recruitment

The evolution of social media usage has brought changes in both recruitment campaigns, as well as in the way employers choose to approach future candidates for a job role. New information and communication technologies have allowed human resources professionals to improve their activities specifically when concerning recruitment and selection (Gregory et al., 2013), this process being defined as “e-recruitment”, used for explaining the ways employers use internet technologies for facilitating the recruitment process (Smith & Rupp, 2004). Aggerholm and Andersen (2018) suggest that “a social media 3.0 recruitment strategy thus breaks with fundamental notions of employees (as the notion of employees as individuals are rearticulated into networked and social human being), of work life (as the distinction between work hours and social life is dissolved) and of the employing organization (as the boundaries between the organization and its surroundings are broken down)” (p.133). The authors stress, therefore, how the employing organization is facing challenges from both an internal and an external perspective, requiring agility in redefining and adapting to the way employees and future employees are influenced and managed.

Within the past ten years, online social networks and content sharing websites have been gaining great popularity, especially among younger audiences. Even though internet job boards are amongst the most preferred means for e-recruitment and

screening processes, studies have shown that social networking websites are useful in attracting more passive candidates (Nikolau, 2014) and, more specifically, in attracting users to increase interactions with businesses (Sanchez, Saura & Debas, 2018). Online users use social media for obtaining information fast and, more importantly, from other users that form a community depending on the interests they manifest (Mahrous, 2016). Moreover, prospective employees can build their professional or personal persona on social networking sites, “search for information on a company to see organizational structures and cultures and exchange information not only with employers, but also potentially with existing employees” (Ladkin & Buhalis, 2016, p.328). In this context, Ladkin and Buhalis emphasize that online users have access to informal information from current or past employees. For instance, Glassdoor (www.glassdoor.com) is a recruiting website collecting company reviews from the organization’s most important resource – its employees. The website allows past and current employees to evaluate the organization on various dimensions: salary reports, impressions on the CEO, pros and cons, benefits and so on. As such, Glassdoor employee satisfaction ratings have been used to link employees’ satisfaction to organizational performance or attractiveness (Massmino et al., 2015; Smith, 2014).

Studies have shown that students and young publics, in general, prefer interacting online with potential employers, as they opt for LinkedIn and Facebook for doing this (Potentialpark, 2011). Human resources professionals have recognized these behaviors as opportunities, especially as social media translate into efficient targeting and in attracting specific segments in the recruitment process. For instance, by giving the example of online interactive job interviews, McCarthy et al. (2017) emphasized the importance to contextualize real-time feedback for applicants so that they understand the reasons they failed an interview. However, targeting specific candidate profiles on social media can be considered an ethical issue, considering the excluded candidates (Broughton et al., 2013). Social media targeting implies adding specific target characteristics that make ads efficient enough to attract the desired profiles. However, users who do not have the intended characteristics do not have the opportunity to apply because the add will be less visible for them on social media, compared to the ones that are specifically targeted. In this sense, recruiters also require training for properly using social media tools as they can become overwhelming without strategically applying the tools for the intended objectives (Koch, Gerber & DeKlerk, 2018).

Potential candidates can form more or less favorable representations of the organization based on the information they find on social media. In this context, future employees are able to make their own selection process, which can include other factors than the ones referring to the job role, benefits or salary expectations. Organizations face the challenge to become attractive to potential candidates, especially by delivering the message that corresponds with the reality of the employees (Stanciu et al., 2008). The employer brand should be visible to the potential candidates that are looking for job opportunities, relevant, catchy and unique (Moroko & Uncles, 2009) to attract new employees, but also for brand engagement, or for enhancing the willingness of employees to believe and strive for the brand (Stanciu et al., 2008).

Employer branding and online users

The concept of *employer brand* was used at the beginning of the 90s, Ambler and Barrow (1996) being the ones who introduced this concept when connecting marketing and

employment situations: “the package of functional, economic and psychological benefits provided by employment, and identified with the employing company” (p.187). The authors underlined the importance of employer branding especially from a management perspective, as the business priorities and values can be delivered through the employment process, but their research also highlights the importance of collaborating with other departments in achieving the overall business objectives. The Chartered Institute of Personnel and Development defines the employer brand as the sets of attributes that differentiate the organization and make it attractive for specific public segments that want to work within the organization (2017), emphasizing the need to invest in achieving higher employer attractiveness, or a favorable image on a market that is full of competing forces.

On online social networks potential candidates have the possibility of contacting current employees directly and ask them details about the jobs they will fill in (Broughton et al., 2013). This can become problematic for organizations who are delivering a message to future employees that does not correspond to the internal positioning. Moreover, Carrillat et al. (2014) found that employers engaged in social media for attracting job candidates should develop online messages with entertainment value as this leads to more favorable responses toward the employer. Looking to identify the factors that should be used in employer branding strategies, Sivertzen et al. (2013) found that innovation, psychological value, application value and the use of social media all relate positively to corporate reputation which influences favorably the willingness of candidates to apply for a position within the organization.

Regarding the perceptions of future employees, Brusch, Brusch and Kozlowski (2018) investigated which company characteristics are most valuable for students between 25 and 40 years old, the most commonly cited being trust, environmental and social awareness and progressiveness. Building trust is challenging considering the consistent volume of information online users are dealing with on a continuous basis. As Brusch et al. (2018) emphasizes, “the biggest challenge is to create a uniform, harmonious employer brand and to communicate this effectively” (p. 150).

Online social networks represent a space of constant interactions and opinion formation that could affect the decision making of individuals looking for a job. Human resources professionals have started to adapt to these online social spaces that represent an additional source of evaluation as far as new candidates are concerned, and a fast and efficient way to allow candidates to submit their intention to join a company (see also Mihalcea. 2017).

Methodology

This research paper is focused on identifying the tactics used by human resources professionals in the recruitment and selection process through social media, specifically to understand the platforms they use in attracting the most appropriate candidates for their organizational needs, the social media channels they use to advertise the job ads and the conversion rate for this medium. The research method we used was the semi-structured interview, applied between 12 and 16 May 2018. We sent out online invitations to 20 subjects two weeks before holding the interview, however only 12 human resources professionals replied positively. Each interview lasted between 30 and 45 minutes and they were all conducted face to face.

The sample contains participants with various expertise levels: 2 of them have a management position, 2 are juniors (between 1 and 3 years of experience), 3 are specialists (between 3 and 7 years of experience), and 3 are seniors (over 7 years of experience). The participants work in both multinational organizations, as well as in independent human resources consulting agencies, they all have a master's degree and live in the urban area, in Bucharest, and their ages vary between 23 and 45 years old.

The research instrument

The first research question was conceived in order to identify the general attitude towards social media from a human resources perspective: "How would you characterize social media recruitment? Can it become the main recruitment method?". Then, the participants are asked to enumerate the specific advantages of using social media in recruitment, and whether there are any characteristics that are present locally, compared to the practices that are adapted from western societies. The forth question seeks to find the specific approaches to online social networks, the tactics that are being used with the best results. Considering the fact that HR professionals need to adapt to the information seeking behaviors of candidates, we asked them what they know about their candidates in terms of their user journey: "Where are candidates looking for jobs? On what types of websites or social platforms?" The last question intended to identify the tendencies in future e-recruitment strategies and the differences between online recruitment and social media recruitment, if there are any.

Results

Regarding the answers related to the first question from the interview, the participants mentioned that social media has become a trend offering the possibility to initiate a professional discussion with potential candidates, although the final employment discussion is led in a safer context in order to build a relationship with the candidate. One of the HR professionals suggested that social media should not be the only method for recruitment, however: "At the time being, social media is part of the organizational communication strategy. I don't think it benefits the employer to become the only recruitment method."

The following question referred to the advantages and challenges of using social media as a recruitment tool. The HR professionals mostly mentioned the benefits and the advantages these tools have. Some suggested that social media offers the possibility to reach a large audience and to send out authentic messages, all with low costs. As challenges, one of the interviewees mentioned the importance of moving the discussion in another setting where the human factor will be more relevant "There are many advantages! But it is very important that the discussion is moved in another setting where the human factor will be more important, and this is something that some HR specialists lose sight of." Another participant shared the same opinion, considering that social media "helps with identifying talents in real time, as we do it ourselves within the company; but I do not consider it as the only recruitment method."

Regarding the differences between social media recruitment tactics and American ones, the responses were approximately similar. Most of the participants suggested that in Romania social media is still at the beginning as far as recruitment is concerned, whilst

in America, the apps have been used for a while and recruitment results are relevant in this sense: "As far as I know, in the USA, the apps are used with priority for recruitment and selection. Even the small to medium companies are investing in Facebook pages with extraordinary results in employment." One of the subjects said that comparing them is not even appropriate, as in Romania social media has barely received some popularity and there are still drawbacks in practice. Others mentioned that a favorable climate is present: "Probably in a few years we will have more platforms for using social media, but for the time being we are glad it is gaining notoriety and exposure on the market." Another participant shared this view suggesting that the trend is derived from international practices and that financial and banking organizations are striving to work on their employer brand to attract new candidates in this context. According to the study participants, the domains that use social media recruitment the most are IT, finance, commerce and tourism.

The most diversified answers were present regarding the online social networks that are being used and the future directions. One of the HR managers said that, before including the social media recruitment strategy in the organization, Facebook usage was forbidden within the company. Starting with 2009, the market changes led to a new vision at the top management level which resulted in creating an official Facebook account and page: "Most of the social media candidates were entry level candidates.", emphasizing that this sort of recruitment is not for all positions. Another participant mentioned that they use multiple social media platforms: "Now we use multiple social media platforms such as Facebook, LinkedIn, Twitter and I believe that this develops a competitive spirit amongst the employees, but also for candidates, as the interview conversion rate through social media is 2:1." LinkedIn is used by most of the sample from this study, while Facebook is on the second place, then Google+, Twitter and job websites Bestjobs and eJobs.

The interviewees mostly agreed that social media is used for recruiting specialists and juniors, and for identifying and attracting managers. In this sense, one of the study participants emphasized that the 2019 e-recruitment strategy should include the collaboration with social media specialists, communication, marketing and PR departments, for achieving the best results possible: "One of the strategies for 2019 refer to investing and preparing the best social media consultants and specialists from the PR and marketing departments, who really know how to use online social networks." One of the participants underlined the importance of initiating a dialogue that could influence the potential candidate and additional publics: "In the last years, social media platforms have been gaining a lot of popularity, growing from a trend to an essential recruitment instrument, and offering the possibility to initiate a discussion with potential candidates. With their help, the organization can communicate in real time with talents, offering details about the working environment and corporate culture through pictures and videos, and in the same time, to keep an eye on the interests of publics." One of the professionals mentioned that digital marketing campaigns are extremely useful, bringing considerable benefits to both important events, as well as to less budgeted ones.

Even though LinkedIn is the main platform used by HR professionals, the participants mostly agreed that the most visited platform is Facebook, which can be an important source for recruiting talents, especially from the generation Y: "Facebook is the most used online social network in the world. Facebook would not be the main choice for

conducting an executive search, but it can most definitely be an important source of talents from generation Y". In the meantime, others believe that LinkedIn is the safest platform for e-recruitment: "I prefer LinkedIn because it takes some kind of responsibility to developing the professional profile on this social network."

The last interview question intended to identify the main approaches to social media recruitment. One of the HR managers suggested that it is very important for each organization to have a good strategy in using social media "Each organization should have an effective presence on social media, which is more than recruitment, it is about communication strategy and marketing". Another experienced HR professional emphasized that anyone can use social media, but what makes the difference between the competition and the organization is the online visibility and how it is approached. For this, additional expertise is needed.

Discussion

The research was focused on identifying the perceived advantages and challenges of social media recruitment by human resources professionals, and the future perspectives of incorporating this e-recruitment method in the overall recruitment strategy. Overall, the HR professionals are keen on adopting these new media in their e-recruitment activities because they have seen the potential and the results for reaching specific audiences. However, there are some challenges that should not be overlooked, such as the fact that online social networks are mostly seen as PR and marketing platforms and recruitment should hold a different position. As other studies have found, online social networks are primarily used for promoting various organizational activities, rather than to appeal to potential candidates (King et al., 2014). In this sense, some of the participants suggested the collaboration with social media consultants and specialists who can bring their expertise which is necessary for developing messages and posts that are attractive to potential candidates, and also for allowing the highest visibility possible on these platforms.

Most of the participants agreed that the biggest advantage is time efficiency, as it helps both HR managers and recruitment agencies to obtain resumed information about candidates, also allowing the interaction with passive candidates and their filtering in the screening process. Moreover, the interviewees suggested that online social networks presence is relevant for candidates who are actively looking for jobs, as the positions may not always be present on recruitment websites. Some of the organizations prefer using online social networks considering the fact that they are able to see the candidate's profile, due to this transparency and direct communication. However, even though using online social networks is popular for e-recruitment purposes (especially LinkedIn and Facebook), there are limits to their use. Recruiters can find outdated information or incomplete profiles; they can face the friend request rejection from the candidate which is necessary for evaluating the profile. For instance, Facebook still remains a personal interactive space for users and recruiters can be perceived as intrusive on this space.

Similar to other studies (Ladkin & Buhalis, 2016), we found that there are blurring boundaries between traditional and online recruitment and that online reputation and brand visibility are important effects of employees being engaged in online dialogue with potential candidates. However, managing online interactions can become challenging and they are not implicit for everyone using social media, which is the main

reason why social media consultants and specialists should be involved in the process. If existing employees would be involved in managing the online relationships with prospective employees, they should understand the implications that these interactions can have on the overall organizational image and should go through a process in this sense.

The interview did not reveal as many challenges, however. Even though the professionals did mention that they face difficulties in evaluating the public profiles of their targeted passive candidates (because these candidates may not allow them to view their entire profile information, especially on LinkedIn), there were no mentions of the possibility of discriminating specific public categories or regarding the trustworthiness of the information presented on these social networking profiles, that might affect the impressions formed by employers either positively or negatively (Caers & Castelyns, 2011).

Limitations of the research

Even though the data collection was conducted face to face, there are some limitations to this research. Overall, we noticed that there is some sort of reluctance in sharing information regarding the selection process and what they actually evaluate when using social media recruitment. As such, we did not obtain many answers when insisting on the limits or challenges of this online recruitment method. Then, the level of experience of the sample is different, so it is difficult to draw some relevant conclusions for a certain profile of human resources professionals. More details are required when describing their activity on online social networks and the actual tactics they use for attracting the desired publics. Additionally, the participants should also be asked whether the information they find on social media about the candidates is used, at some point, in the decision making process when proposing a candidate for an internal position. Moreover, the research investigated only the perspectives of HR professionals, and further research should also evaluate the perceptions of candidates (both active and passive) using these online social networks regarding the fact that employers are evaluating their profiles from a professional point of view.

Conclusions

Understanding how social media recruitment is conducted by human resources professionals is important to consider the challenges concerning the widely used social networking sites. Even though this medium has been offering many benefits and return on investment to many organizations from both a PR and a HR perspective, there are still challenges in understanding whether this empowerment is being used for or against candidates, and employees, respectively. The paper explores some of these challenges, but the research sample was not consistent enough to draw some specific conclusions concerning the preferences and tactics used for including and combining PR and marketing into the overall human resources objectives. Whereas social media are used for gaining visibility and employer brand awareness, as far as HR is concerned, social media have the potential of bringing relevant and *pre-screened* prospective employees that eases the efforts of professionals in obtaining applications. On the other hand, there are many types of segments of online users who are missing out on potential relevant candidates, which can become an issue. Facebook is still one of the preferred options for connecting with prospective employees, but this is mainly seen as an entertainment and

personal space, so passiveness could disable employers to be successful or cost effective on this social network. Future research should focus on identifying the tendencies in using online social networks successfully, the specific targets set out by human resources departments and the reactions of future or past internal stakeholders, specifically belonging to generation Y, regarding the approaches of organizations using online recruitment methods to attract candidates.

Abstract. *Within the framework of staff assessment, especially in the selection area, game-based assessments (GBA) have become one of the most discussed developments in recent years. Game-based assessment has received a lot of media attention and managed to capture the interests of many organizations (e.g. Unilever, AXA Group, Deloitte, etc.). What are actually game-based assessments? These are games that allow you to measure the knowledge, abilities, values, personality, motivation, or skills of the rated person. They fall into the broader category of "serious games", i.e. games designed for purposes beyond entertainment. The introduction of GBA into selection programs contributed, among other factors, to increasing the volume of applications and decreased dropout rates compared to other tests, such as traditional numerical and verbal. Game-based assessments can also help maintain a high commitment during the evaluation and also increases the amount of time that data can be collected. Previous studies highlight that those applying for a job are eager to use game-based assessment for self-evaluation, especially when these games are available for free. Also, in game-based assessment, it is likely to be less obvious to a candidate what behavioral / response elements are measured. Game-based assessment is more likely to generate genuine responses from candidates because they are immersed in gaming experience, thereby reducing the likelihood of falsification and distortion responses. Previous studies have shown that gamified evaluation reduces testing anxiety and that this type of games has been well received by candidates in real selection settings. The assessment is also reinforced by the fact that not only the final data (final result) is recorded, but also process data such as reaction time, time spent on each item, or intermediate steps taken to reach the final result. This new information can add value to the conclusions drawn on the knowledge, skills or traits of the candidates. The potential of games as evaluation tools can only be achieved if data evaluation methods can be developed in psychometrically feasible ways. Many of the traditional methods developed to evaluate the fidelity and validity of (classic) tests do not match game-based assessment. Currently, the game-based assessment marketplace is dominated by alternatives that are not very clear in comparison to traditional psychometry.*

Keywords: *game-based assessment; recruitment; psychometrics.*

Introduction

The application of game mechanics and game design – often called gamification – in non-gaming contexts such as in business, education, and social projects has emerged as a major trend in recent years. Gamification is the use of game-play mechanics for non-game applications (Deterding et al., 2011). Within the framework of staff assessment, especially in the selection area, game-based assessments (GBA) have become one of the most discussed developments in recent years. Game-based ratings have received a lot of media attention and managed to capture the interests of many organizations (e.g. Unilever, AXA Group, Deloitte etc.). In a recent study of human resources practitioners, 75% of participants indicated that they would consider using gamification as part of their own recruitment and selection strategy in the near future (Cut-e Group, 2017).

Gamification guru, Yu-kai Chou defines gamification as “the craft of deriving all the fun and addicting elements found in games and applying them to real-world or productive activities” (Huang & Soman, 2013, p.6). Gamification “represents a management practice similar to other managerial initiatives designed to make the experience of work more positive” (Mollick & Rothbard, 2014, p.16). Gamification can be used for numerous purposes and in various fields. For instance, gamification has a particularly special place in the HR community. Jacobs (2012), stated that “we can gamify many areas of HR, from talent sourcing through to performance management” (p.14). Modern day HR divisions take an increasingly data-driven approach to people management, i.e., the people analytics approach. Games are a powerful instrument for studying human behavior. In a game, rather than asking someone what they did, you can directly observe their behavior. Games also foster increased participation and motivation, which leads to increased quantity and quality of data. By coupling the data advantage provided by gamification with sophisticated analytic techniques, meaning can be extracted. These data-driven approaches are better at dealing with complex data sets, capturing nonlinear relationships, and predicting future outcomes. As a result, they are better suited to modeling real-life complex problems.

Game-based assessment in recruitment

Technological development and increasing globalization force companies to look for new solutions. Candidates for the job have also been subjected to the change characteristic of the present day. The people from the Generation Z (born after 1990) and Generation Y (born after 1980, the so-called Millennials) approach potential jobs with a different attitude than their predecessors (McCrindle Research, 2006). Daily use of the IT sector, greater confidence and commitment to their own hobby means that they require from an employer mobility in obligations and make full use of available technology solutions (Ng, Schweitzer, & Lyons, 2010). Recruitment via Skype, or submitting an application for a post in the company on the other side of the globe is not a challenge, but daily life for Ys and Zs. So, in searching for new forms of employee selection, it is necessary also to take this aspect into account.

Recruitment refers to “any practice or activity carried on by the organization with the primary purpose of identifying and attracting potential employees” (Noe et al., 2012, p.202), so it comprehends all the techniques to make the organization suitable and appealing for skilled workers. As Hinojosa (2015, p. 2617), stated, “recruitment

activities are important for attracting top talent and are a source of competitive advantage for an organization”

Recruiting activities have undergone a series of changes through time, starting from the traditional recruitment to e-recruitment, to finally come up until the gamified recruitment, which is considered to be the most innovative way developing today. But, the advent of a new way of recruiting does not mean the end of the other techniques. In fact, no one is abandoning the old way, but all the research suggests that incorporating tests and games in the process delivers a higher predictor of success (Starner, 2014).

E-recruitment (www.hrzone.com) means using electronic resources, typically the internet but also HR software, to guide or assist the hiring process in order to reduce the administrative and financial burden of recruitment and gain access to a wider pool of talent. This kind of recruiting can be realized by agencies that through the Internet are able to collect bigger numbers of resumes and to send these CVs to companies. However, organizations can do it by themselves through apposite brand websites that enable potential employees to know about them. In this case, the process is easily structured and the advantage is that candidate can add his/her data and can send them in real-time to the organization. Organizations want “to motivate job applicants to explore their recruitment websites to learn more about the organization’s history, values and vision before finally applying” for a vacant position (Reiners & Wood, 2015, p.554). Secondly, organizations want to make their job offers more enticing also once applicants are received.

A second advantage is that organizations can check increasing numbers of resumes and it enlarges the potential of achieving good employees. Another clear advantage is that e-recruitment reduces the costs compared with the traditional ways of looking for new employees, like agencies or newspapers. Furthermore, e-recruitment does not eliminate the job interview, so it means that once organizations select potential candidate from the huge amount of resumes received, they have to interview these people because information contained within CVs are not sufficient to understand their capabilities. From the point of view of employees, it enables them to reduce the time spent looking for a job and it allows them to find new opportunities rapidly, increasing their possibilities of changing company.

Even if it is not so easy to understand the perfect candidate, social network sites represent a good way to attract people, sharing advertising to know the brand and to say when there are vacant job positions available. It has been revealed that 68% of online adults use social networking sites such as Facebook, Twitter, Instagram and so on (www.pewinternet.org). To better understand what social networks are, the definition provided by Boyd and Ellison (2008), was used: “we define social network sites as web-based services that allow individuals to construct a public or semi-public profile within a bounded system, articulate a list of other users with whom they share a connection, and view and traverse their list of connections and those made by others within the system” (Boyd & Ellison, 2008, p.211).

The use of social networks is evidently a successful route and the new ways in which recruiters are interacting with candidates is allowing for more enjoyable experiences. Brands that are choosing to use gamification are obtaining higher levels of retention and building bigger online communities (<http://theundercoverrecruiter.com>). At the same

time, people like to show themselves on the social media. This can help organizations exploit these tools and the information they share to understand candidate profiles, personalities and characteristics. Therefore, social network sites like Facebook, LinkedIn, blogs on websites and YouTube became the best ways to reach the desired people.

This type of recruitment is usually defined as social recruitment. Social recruitment is "is concerned with sourcing candidates for jobs via social media channels and social media networks" (www.hrzone.com) For instance, LinkedIn was born for business because it came to life for the working world. It enables people to exhibit the personal career with the places they worked in, the studies they attended to and so forth. It provides the recruiters the chance to identify top talents immediately. It also enables the establishment of a personal network of colleagues and organizations, increasing the possibility of being selected for a job interview. Furthermore, well-prepared people rapidly change their position. While in the past, young men started working in a company and more or less spent their entire life working there, now, people have no limits, can travel easily and can change job and country without any problems. Another changing dynamic is that graduate people are less skilled and have low experience, so there is a sort of war to attract the best talents from the universities. Now, the goal is that companies show the vacant positions in a way that help possible candidate to apply for that job.

As stated by Kim and colleagues (2012, p.1612), "many firms now realize the importance of actively attracting and retaining highly skilled, quality employees as a necessary component of their competitive advantage". It is well accepted that, the basis of the success of any company is due to the human capital, which is the combination of people's capabilities and skills. Therefore, the fundamental job of any recruiter is sourcing talent and engaging employees in the organization. For this, they have to ensure that the candidate's skills match well with the organization's requirement and culture. When Gamification is applied to the recruitment process, it brings several benefits. Candidate elimination is done at a much faster pace as it allows firms to test specific skills like time management, creative and innovative thinking etc. It helps the candidate to understand the information about the firm and policies while having fun. Gamification's tool has the potential to bring out the on-the-job performance of the candidate by giving him or her a simulated platform of the job. Apart from that, it also helps in revealing actual behavior and capabilities of the candidate. Gamification is attractive and came as an innovative platform for the companies. It thus helps in establishing the brand as a leader in its field, especially among youth (Han & Collins, 2002). The use of gamified recruitment increases the positive image of the organization and at the same time the employment brand. Employment brand refers to the group of tangible and intangible elements that identify and make a company unique for job seekers, showing which are the characteristics of the working experience within the organization itself (Lievens et al., 2007). The employment brand can be defined "as outcomes of applicants' decision opportunities attributable to job seekers' beliefs about the company as an employer"; therefore, it is the perception about the company from the point of view of potential candidates (Han & Collins, 2002). In fact, if potential applicants see that the company is so innovative even from the recruiting point of view, it could mean that it is innovative also in the production processes and it can be highly attractive for talents, even if working for other competitors. Furthermore, candidates do not perceive the lack of overlapping of content between the test and the workplace as deterioration in validity, and the increased

satisfaction and perceived robustness of the game-based assessment have a positive effect on the overall perception of the fairness of the selection. Actually, gamified solutions for recruitment make hiring processes more meritocratic from candidate point of view, and for this reason, they can instill more confidence and trust.

Although the evidence is still insufficient, there are a number of intuitive arguments for the benefits of game-based assessment. Overall, employers can use game-based assessment to present an innovative image of the organization and increase their attractiveness to potential candidates without compromising their professionalism. The use of (serious) games as an evaluation tool can extend and even strengthen the field of assessment as this type of games has the potential to reveal both the knowledge and the skills and traits that are more difficult to detect when evaluated through traditional evaluation methods, (De Klerk, Eggen & Veldkamp, 2014; Mislevy et al., 2014). Following the methodological approach already used in educational environment (Al-Azawi et al., 2016), two approaches to building and using GBA in the organizational environment can be distinguished: gamified assessment – by gamifying (already existing) psychometric test; psychometric play - use of a game to gather evaluation data.

In a study by Montefiori in 2016, it was noted that from the perspective of the candidate, the presence of the assessment based on games in the selection process are a motivating factor for more than half of the surveyed participants (Montefiori, 2016). In an organizational context, game-based assessment is not limited to selecting applicants. It can also be a very useful tool that can be used to attract potential candidates. Previous studies (Laumer et al., 2012) highlighted that those applying for a job are eager to use game-based assessment for self-evaluation, especially when these games are available for free. Game-based assessments can also help maintain a high commitment during the evaluation, which reduces the likelihood of some candidates dropping out in the process and also increases the amount of time that data can be collected (Iseli, Koeig, Lee, & Wainess, 2010; Levy, 2013).

Also, in the GBA, it is likely to be less obvious to a candidate what behavioral / response elements are measured. This aspect was highlighted by Csikszentmihalyi (1990), who asserts that game-based assessment is more likely to generate genuine responses from candidates because they are immersed in gaming experience, thereby reducing the likelihood of falsification and distortion responses (Csikszentmihalyi, 1990). Previous studies (Kato & de Klerk, 2017) have also shown that game-based assessment reduces testing anxiety and that this type of games has been well received by candidates in real selection settings. The use of (serious) games as an evaluation tool can extend and even strengthen the field of assessment as this type of games has the potential to reveal both the knowledge and the skills and traits that are more difficult to detect when evaluated through traditional evaluation methods, (De Klerk, Veldkamp & Eggen, 2015; Mislevy et al., 2014).

Instead of inviting applicants to job interviews right away, organizations give them games that simulate the work environment and test their aptitude" (Herger, 2014, p.16). Therefore, gamification can allow recruiters to test candidate's skill, motivate them to complete certain tasks, and generally engage with the recruitment process (<http://recruitloop.com>). As Roebuck (2012, p.42) stated, "by applying the same principles that inspire people to play games, such as achievements, status and rewards, businesses can drive deeper engagement and use this to attract [...] employees, as well

as improve staff and business performance". Game, mixed with fun, can increase people's motivation improving their interest toward a particular job position, a company or a brand. From the point of view of applicants, the motivation is high for many reasons. Firstly, they are applying for a position in an innovative company, which is exploiting the best and recent techniques to hire the more talented people and it is stimulating by itself. Secondly, they are playing, so they can take the experience more positively, and with sportsmanship, compared with a common interview.

One of the key advantages of using gamification in recruitment relies on the fact that not only will candidates be coming back regularly to interact with the company brand, but they will be acting as advocates for the brand (<http://theundercoverrecruiter.com>). Another advantage is that organizations can attract a more diverse group of applicants (<http://www.executiveboard.com>).

Gamification can help recruitment to understand people's behaviors, state of mind, abilities, attitudes and potentialities while fulfilling their mansions. "Understanding a person's job skills from how well they play is passed on an extensive body of psychometric research about how behavior links to actual job performance" (www.revelian.com). Gamification inherently immerses test takers in the game world, allowing them to respond naturally to challenges. These natural responses can unveil a lot about a potential employee's cognitive skills, such as their decision-making, leadership, efficiency and organization (Aldridge, 2015). While people are playing they "generate several megabytes of data, exponentially more than what's collected by the SAT or a personality test. They measure how long you hesitate before taking every action, the sequence of actions you take, how you solve problems – all of these factors are logged as you play, and then are used to analyze your creativity, your persistence, your capacity to learn quickly from mistakes, your ability to prioritize, and even your social intelligence and personality" (Peck, 2013).

In one of the biggest advantages of game-based assessment also lays the greatest challenge. What to do with and how to interpret the enormous quantities of data that can be produced by performing a game-based assessment (Levy, 2013). In contrast to a standardized test, which only produces product data, a serious game also provides process data. Process data are the actual log files of data collected that can, in great detail, when analyzed, show how students have reached their product data. Process data are mouse clicks, keystrokes, navigational behavior, time stamps etc. (Rupp et al., 2012). Performance in a serious game can produce many pages of log file data in just a short period of time. The challenge is to find meaningful relationships between the data presented in the log files and their relationships to the constructs to be measured in real life.

Even if this effective tool is developing with success especially among big corporations, we need to underline some of its pitfalls. First of all, we need to make some considerations about the costs faced to sustain this new solution. Organizations can create their own games to attract new talents, but designing the right one with the specific elements and characteristics appropriate to understand the candidate is not easy. For this type of approach, any organization will need to be supported by experts of gamification and psychologists specialized in psychometrics. It has been estimated that 80% of gamified apps will fail to meet business objectives, primarily due to poor design (<http://theundercoverrecruiter.com>). In fact, first it is important to understand what

the organization is looking for in terms of soft skills, and second, it is essential to translate these needs and requests in the right forms of gamified solutions.

Another disadvantage is that probably these tools are young-people-directed. Moreover, one of the risks candidates could face is to underestimate the importance and the validity of the test. While game-based testing works very well in educational environment, many test takers are skeptical of its applications in formal assessment. Some test takers fear that if an assessment is gamified, this promotes the idea that the exam is less formal, or that the answers don't hold as much importance. The risk here is that people will take the tests less seriously, and thus performs worse than they would have on a traditional test (Aldridge, 2015). In fact, according to a survey of 600 HR professionals by SHL in 2015, "only 44 percent of human resources pros said their organizations use objective data on employees' competencies and skills to make workforce decisions" (www.insurancejournal.com). In particular, we would like to underline that "it will take time before researchers determine how well these new assessments predict job performance" (Meinert, 2015, p.92).

While people are playing, the algorithms behind games are able to track the personal skills and abilities. It is not clear how these algorithms work, but as those from knack.it stated, "the company team has expertise in behavioral and cognitive neuroscience, big data and data science, computer science and software engineering, game design, and user-experience design" who help them analyze data efficiently and with scientific rules (www.knack.it).

Although Game-Based Assessment (GBA) has become increasingly popular in workplace assessment, especially, in the context of large international companies' graduate and apprenticeship schemes, yet little is known about this psychological assessment approach. Scientific research describing this psychological assessment approach is virtually non-existing, and there is often confusion about the nature of this method and the place it occupies in the wider gamification arena. Cause and effect at the data analysis stage of elaborately designed games becomes difficult, if not impossible. The greater the number of design elements, the higher the risk of result of contamination, and the harder ^[1] it is to interpret behavior, to the point that it is impossible to directly link a behavior to a specific measure (Narayanan et al., 2016). The real challenge is to identify and select the best evidence linking game performance with the assessment of participants' abilities.

Many of these games are based on scenarios or contexts which, at best, seem irrelevant and, at worst, misinform the job-role requirements of potential candidates (De Klerk & Kato, 2017). Some game design elements may not be necessary or even interfere with selection (e.g., feedback, Yigal & Mairav, 2015). Nevertheless, with the psychometric models improving (Mislevy et al., 2014), we might also see game-based assessment being used for a summative or credentialing purpose in the future. Future research should therefore focus on investigating the extent to which serious games can be used in high-stakes assessment.

Acknowledgments. This research was supported by the S.I.R.O. project „Innovative solution for online recruitment“, contract no. 36/02.08.2017, MySMIS 2014 code 115926.

Abstract. *The paper aims to present how could an expert system, based on fuzzy logic, be used for the service quality improvement of a car wash point station. A single-case study is approach and four linguistic variables are taken into consideration, namely: (i) the average waiting time (mean delay); (ii) the ratio factor (of traffic intensity) in the car wash station; (iii) the number of stands; and (iv) the number of employees per shift. Further, the Gaussian membership functions are selected for the fuzzy sets and 27 rules are established. Data are processes using MATLAB Fuzzy Logic Toolbox. The results prove that the number of stands and the number of employees per shift directly influence the average waiting time and as such, have a major impact on the perceived service quality. Although, the case under discussion is a simple one, it facilitates a heuristic approach of the business environment and it proves that the adoption of these computational techniques may foster service quality improvement.*

Keywords: *fuzzy logic; expert system; service quality improvement.*

Introduction

The “waiting lines” (queuing lines) is one of the most important areas in operations management (Debo, Parlour, & Rajan, 2012; Kremer & Debo, 2015), and it represents a number of customers waiting to be served (at the store house, ticket bank, traffic light, washing cars etc.). In most situations, customers accept that they have to wait for the service to be delivered but they are not willing to wait for too long. Further, various studies have demonstrated that long queues influence customer satisfaction (Borges, Herter, & Chebat, 2015), perceived value of the service (Debo et al., 2012; Koo & Fishbach, 2010; Kremer & Debo, 2015) and customer loyalty (Bielen & Demoulin, 2007). This basically have their roots in service quality which incorporates a relational and operational dimension; the former focuses on understanding customers’ desires (Payne & Frow, 2005) while the latter concentrates on the activities that need to be perform in order to ensure service efficiency (Stank, Goldsby, & Vickery, 1999; van Riel, Semeijn, Ribbink, & Bomert-Peters, 2012).

Although the relationship between queue length and service quality is emphasized by several scholars (Alonso, Barreda, dell'Olio, & Ibeas, 2018; van Riel et al., 2012), its direction is debatable. Thus, Kremer and Debo (2015) and Debo et al. (2012) state that an increased queue length can signalize a high quality service while De Vries, Roy, and De Koster (2018) argue that there is a negative relationship between the waiting time and service quality. The former concentrate on product sales while the latter focus on restaurants. Thus, the perspective is different do to the fact that when it comes to products, a long queue is directly associated with a high level of quality; if the product has a high quality, more customers want it. The situation is different when it comes to services; a long queue is usually considered to be a signal that the company does not have the capacity to satisfy customers' demand in a timely manner.

Table 1. The advantages and disadvantages of the queuing theory (Brown, 2012; Chowdhury, 2013, p.475)

Advantages	Disadvantages
• It provides models that are capable of determining arrival pattern of customers or the most appropriate number of service stations. • It is helpful in creating a balance between the two opportunity costs, namely: optimization of waiting costs and service costs. • It provides better understanding of waiting lines in order to foster the development of an adequate service with a tolerable waiting time. • It offers information regarding setting up workstations, requirement of manpower and number of customers.	• Uncertainty is present in almost all queuing situations and it arises due to the fact that: (i) we may not know the form of the theoretical probability distribution which applies; (ii) we may not know the parameters of the process even when the particular distribution is known; (iii) we could know the probability distribution of the outcomes and not the distribution of the actual outcomes. • The distributions are usually assumed in queuing models. • In multi-channel queuing, the departure from one queue often forms the arrival of another; this makes the analysis more difficult. • Most of the real life queuing problems are too complex to be solved using queuing theory technique. • The waiting space may be limited. • The arrival rate is state dependent since long queues have a negative impact on customers' satisfaction. • The arrival process is not stationary. • The working period usually has peak periods and slack periods; during these, the arrival rate is highly different from the overall average. • Queue discipline may not be first come, first serve.

Within this framework, the theory of waiting line (queuing theory) is developed. Thus, it involves studying the behavior of customers and of those who provide the services (El-Naggar, 2010; Oyatoye et al., 2011; Render, Stair, & Balakrishnan, 2006; Rodríguez Jáuregui, et al., 2017) and it provides various quantitative and qualitative models that can help managers understand and make the best decisions. Nevertheless, it has several advantages and disadvantages (Table 1).

For a given number of service lines, waiting systems can be characterized by: (i) percentage of time, or probability, for which the customer is served; (ii) the likelihood of having a certain number of clients in the system; (iii) the average number of units (customers) in the system; (iv) average time spent by each client in the system (waiting time plus service time); (v) the average number of units (customers) in the waiting line; (vi) the environment spent by each client on the waiting line; and (vii) percentage of time, or the likelihood of a new customer arriving to have to wait for the service to be delivered (Render, Stair & Hanna, 2006; Rodríguez Jáuregui et al., 2017). Based on these information, the managers will be able to improve the quality of their services.

Against this background, the current article aims to present how could an expert system, based on fuzzy logic, be used for the service quality improvement of a car wash point station. Thus, the paper is structured as follows: Section 2 brings forward the characteristics of a general queuing system while Section 3 emphasizes the case study particularities. A fuzzy system is designed for the service quality improvement of a car wash point station and the results prove that the number of stands and the number of employees per shift directly influence the average waiting time and as such, have a major impact on the perceived service quality. Further, the article closes by drawing several conclusions and emphasizing the theoretical and practical implications of the research findings.

Simulation of queuing systems

All models represent simulations of real-world phenomena. From a general perspective, decisional simulations are a way of exploring, in a safe and controlled environment, what may happen if a certain situation occurs (Leon, 2016); it is somehow similar with the process labeled by Thorndike as “trial and error learning”, only this time variables and models are involved instead of human actions and the process takes place in a hypothetic environment and not in a real one. From a more restrictive perspective, decisional simulation is a method of studying systems’ behavior through experiments (Leon, 2016). It refers to a specific class of dynamic models that require the detailed observation over time of the random sizes that interfere in one complex system.

Simulating a waiting lines system is an example of discrete simulation. Generally, the waiting phenomena can appear in any situation that has the following characteristics: (i) there is a significant number of applicants for certain services; (ii) it is not known when the service will be requested; (iii) there are a number of service stations performing the requested service; (iv) the serving time is not known for certain; and (v) there are uncertainties regarding customer behavior after arrival in the system service (Derbala, 2005).

The Service System is characterized by: (i) the number of waiting lines; (ii) the number of servers; (iii) the servers, arrival and service patterns; and (iv) the service priority rules (Zheng, Lin, Chen, & Xu, 2018).

Our approach is a single-line, multiple-server system, has better performance in terms of waiting times than the same system with a line for each server (Figure 1). The Number of Servers System ($S_1, \dots, S_m$) serving capacity is a function of the number of service facilities and server proficiency. In this model the terms server and channel are

equivalent. It is assumed that a server or channel can serve one customer at a time (Baldwin, Davis IV, Midkiff, & Kobza, 2003).

Figure 1. Components of a queuing system

The properties of our specific waiting line models are (Chase, Aquilano, & Jacobs, 1998):

Layout: multichannel.

Service phase: single.

Source population: infinite.

Arrival pattern: Poisson distribution: the arrival process is random and we assume it is a Poisson distribution.

Queue: FCFS (First Come First Served). This rule states that customers in line are served on the basis of their chronological arrival.

Service pattern: Exponential distribution. Other important factor is time the car (unit) spends with the server once the service has started, named **service rate** as the capacity of the server (the number of units per period time). A good approximation of the service rate can be given by exponential distribution.

Permissible queue length: unlimited.

Because a quantitative analysis involves information about the modeling system and complex probabilistic modeling techniques, a qualitative analysis is needed to identify the correlations between the various system parameters and their prediction. Thus, using a fuzzy model is natural.

Fuzzy logic control systems are a solution commonly used for automated control applications of processes with uncertain or variable parameters in wide limits, including physiological processes. Design fuzzy regulators is primarily based on empirical experience, however recent analytical design methods, through neuro-fuzzy techniques allow obtaining satisfactory, or even good, solution solutions, avoiding it accurate mathematical modeling of the process. Using these methods for a decision process is an ambitious study subject to the characteristics of these processes, but at the same time it is a modern one, both through description design methods, and by using them in a management field in full development (Mendel, 2017).

From a managerial point of view, the control of service features and maintenance services can only be achieved by controlling the process that provides the service. Measurement and control of process results are essential to achieving and maintaining the required service quality. When a service quality system is established, the customer represents the point of convergence of all the expected actions (Paraschivescu, 2006).

The decision-making process involves complex and usually undefined parameters with a high degree of uncertainty due to the fact that the conditions of the problem are not properly perceived. Any dynamics of the system cannot be described by the use of traditional mathematics due to the inherent complexity and ambiguity. That's why it's more convenient to use fuzzy logic for this approach. Fuzzy logic is a scientific tool that allows modeling of systems without detailed mathematical calculations using both qualitative and quantitative data. Estimates or calculations are made by words, while knowledge is represented by the IF-THEN linguistic rules (Phillis & Kouikoglou, 2009).

In order to design and illustrate the fuzzy expert system, the problem of improving the quality of a car wash point station is considered. An expert system is designated to replace the human expert from a certain field and it is made from the following components: knowledge basis, inference engine and user interface.

Fuzzy expert systems are capable of solving problems with uncertainty elements, the reasoning developed by them is based on fuzzy logic. Unlike classical logic, in which only two values of truth are used, fuzzy logic allows all predicates to admit truth values in the interval $[0,1]$, providing a more accurate representation of the real world (Zadeh, 1994).

The uncertainties regarding system's variables and parameters are expressed through membership functions. The rules that reflect causal constraints are expressed in the form of a collection of instructions of type IF - THEN. These can be provided by human experts or can be extracted from the numerical data obtained through measurement, and they describe the operation of the system that should be modeled (Kwang, 2005).

The main idea is that, based on fuzzy logic approach, it can monitor certain parameters of a process, the parameters that essentially determine the quality of the executed service to the account that can be quantified. Knowledge-based society is a reality, and continuing education is one of the most effective solutions to remain competitive. Therefore, ensuring a quality management of the services based on computational technologies is a threshold to be overcome.

Service quality improvement – case study

In order to illustrate the design of fuzzy system for service quality improvement a car wash point station will be considered. The way of doing business in a car wash point station is quite simple. A client brings his dirty car in order to be cleaned up. If a car wash stand is available, the client takes it inside the stand. If the stand is unavailable, the client has to wait until it becomes available. The goal is to advice the manager of the station on how to adopt a decision in order for the client to be satisfied.

The first step in designing an expert system is problem specification It should determine the input and output variables of the system, as well as the ranges in which these fall in. For the considered case, there are four linguistic variables: (i) average waiting time

(mean delay) t ; (ii) ratio factor (of traffic intensity) in the car wash station r ; (iii) number of stands s ; and (iv) number of employees per shift e .

The client's average waiting time t is the most important performance criterion of the station. The mean delay should not exceed the limits which the clients consider as being acceptable.

The ratio factor of the service centre r represents the ratio between the client arrival rate λ , and the departure rate μ . The magnitudes of λ and μ indicate the rate of waiting clients. Apparently, the ratio factor is proportional to the number of stands s .

The number of stands, s , and the initial number of employees per shift, e , directly influence the client's average waiting time and as such, has a major impact on the car wash station's performance. By increasing s and e , we obtain smaller values of the average waiting time, but at the same time will increase the costs implied by opening stands and increasing the number of employees per shift.

In the considered model are three input variables - t , r and s , and an output variable - e . In other words, the car wash centre's manager wants to determine the number of employees per shift which are necessary for keeping the average waiting time within an acceptable range.

The ranges of the linguistic variables are specified in Table 2 along with normalised values of parameters t , r and s contained in the interval $[0,1]$. It can be noticed that for the mean delay parameter t , only three linguistic variables are considered - *Very Short*, *Short* and *Average* because values like *High* and *Very High* are simply not practical. A manager cannot allow letting a client wait longer than the average time.

Table 2. Linguistic variables and their ranges

Linguistic variable	Linguistic value	Notation	Normalized limits
Average waiting time (t)	Very Short	VS	[0, 0.25]
	Short	S	[0.2,0.6]
	Average	A	[0.5,0.8]
Number of stands (s)	Low	L	[0, 0.4]
	Average	A	[0.4,0.7]
	High	H	[0.6,1]
Ratio factor (r)	Low	L	[0, 0.5]
	Average	A	[0.4, 0.75]
	High	H	[0.7, 1]
Number of employees per shift (e)	Very Low	VS	[0, 0.25]
	Low	L	[0, 0.3]
	Rather Low	RL	[0.25, 0.45]
	Average	A	[0.35, 0.75]
	Rather High	RH	[0.55, 0.75]
	High	H	[0.7, 1]
	Very High	VH	[0.8, 1]

Fuzzy sets can have a variety of forms depending on the nature of the case in question. For our case we choose Gaussian membership functions for adequate representation of the expert's knowledge and at the same time, significantly simplifies the computation process. In Figure 2 are presented the fuzzy sets for all linguistic variables used in the

fuzzy system. One of the key points refers to maintaining sufficient overlap in some adjacent neighboring sets, such that the fuzzy system has a response as linear as possible.

Figure 2. The fuzzy sets for all linguistic variables used in the fuzzy system

Furthermore, the fuzzy rules must be obtained. In order to accomplish this requirement, an expert acknowledgement is required using the fuzzy linguistic variables previously defined. The necessary knowledge can also be collected from books, databases, and diagrams or based on observations.

There are three input and one output variables in our example (Figure 3). It is often convenient to represent fuzzy rules in a matrix form. Figure 3 presents the graphical representation of the three input parameters and of the only one output.

Figure 3. The interface for representing the input and output data of the system

A detailed analysis of the operations at the car wash point and based on an expert opinion determined us to obtain 27 rules that represent the complex relationships between all the variables used in the expert system as can be seen in the Figure 4.

1. If (Mean-delay is Very-short) and (Ratio-factor is Low) and (Number-of-stands is Low) then (Number-of-employees is Very-low) (1)
2. If (Mean-delay is Short) and (Ratio-factor is Low) and (Number-of-stands is Low) then (Number-of-employees is Very-low) (1)
3. If (Mean-delay is Average) and (Ratio-factor is Low) and (Number-of-stands is Low) then (Number-of-employees is Very-low) (1)
4. If (Mean-delay is Very-short) and (Ratio-factor is Low) and (Number-of-stands is Average) then (Number-of-employees is Very-low) (1)
5. If (Mean-delay is Short) and (Ratio-factor is Low) and (Number-of-stands is Average) then (Number-of-employees is Very-low) (1)
6. If (Mean-delay is Average) and (Ratio-factor is Low) and (Number-of-stands is Average) then (Number-of-employees is Very-low) (1)
7. If (Mean-delay is Very-short) and (Ratio-factor is Low) and (Number-of-stands is High) then (Number-of-employees is Low) (1)
8. If (Mean-delay is Short) and (Ratio-factor is Low) and (Number-of-stands is High) then (Number-of-employees is Low) (1)
9. If (Mean-delay is Average) and (Ratio-factor is Low) and (Number-of-stands is High) then (Number-of-employees is Very-low) (1)
10. If (Mean-delay is Very-short) and (Ratio-factor is Average) and (Number-of-stands is Low) then (Number-of-employees is Low) (1)
11. If (Mean-delay is Short) and (Ratio-factor is Average) and (Number-of-stands is Low) then (Number-of-employees is Very-low) (1)
12. If (Mean-delay is Average) and (Ratio-factor is Average) and (Number-of-stands is Low) then (Number-of-employees is Very-low) (1)
13. If (Mean-delay is Very-short) and (Ratio-factor is Average) and (Number-of-stands is Average) then (Number-of-employees is Rather Low) (1)
14. If (Mean-delay is Short) and (Ratio-factor is Average) and (Number-of-stands is Average) then (Number-of-employees is Low) (1)
15. If (Mean-delay is Average) and (Ratio-factor is Average) and (Number-of-stands is Average) then (Number-of-employees is Very-low) (1)
16. If (Mean-delay is Very-short) and (Ratio-factor is Average) and (Number-of-stands is High) then (Number-of-employees is Average) (1)
17. If (Mean-delay is Short) and (Ratio-factor is Average) and (Number-of-stands is High) then (Number-of-employees is Low) (1)
18. If (Mean-delay is Average) and (Ratio-factor is Average) and (Number-of-stands is High) then (Number-of-employees is Very-low) (1)
19. If (Mean-delay is Very-short) and (Ratio-factor is High) and (Number-of-stands is Low) then (Number-of-employees is Very-High) (1)
20. If (Mean-delay is Short) and (Ratio-factor is High) and (Number-of-stands is Low) then (Number-of-employees is High) (1)
21. If (Mean-delay is Average) and (Ratio-factor is High) and (Number-of-stands is Low) then (Number-of-employees is Average) (1)
22. If (Mean-delay is Very-short) and (Ratio-factor is High) and (Number-of-stands is Average) then (Number-of-employees is Average) (1)
23. If (Mean-delay is Short) and (Ratio-factor is High) and (Number-of-stands is Average) then (Number-of-employees is Average) (1)
24. If (Mean-delay is Average) and (Ratio-factor is High) and (Number-of-stands is Average) then (Number-of-employees is Low) (1)
25. If (Mean-delay is Very-short) and (Ratio-factor is High) and (Number-of-stands is High) then (Number-of-employees is Rather_High) (1)
26. If (Mean-delay is Short) and (Ratio-factor is High) and (Number-of-stands is High) then (Number-of-employees is Average) (1)
27. If (Mean-delay is Average) and (Ratio-factor is High) and (Number-of-stands is High) then (Number-of-employees is Rather Low) (1)

Figure 4. The rule base which define the fuzzy system

Once defined the fuzzy sets and fuzzy rules their codification is necessary, this way actually constructing the expert system. In order to do this, we used MATLAB Fuzzy Logic Toolbox from MathWorks (Fuzzy Logic Toolbox User's Guide 2018) because such an instrument offers a complete environment for building and testing an expert system. MATLAB Fuzzy Logic Toolbox has five integrated graphical editors: the editor for the fuzzy inference system, the rules editor, the editor for membership functions, the fuzzy inference viewer and the 3D viewer of output data.

Figure 5. Evaluation and representation of the rules

The last and most laborious task is that of evaluating and tuning the system. Once the rules are introduced in the system, the Rule Viewer module can be viewed, which shows

what happens with the system in the moment when the values of the input data are scrolled. Depending on the interest, we can see the optimal solution in Figure 5.

Fuzzy Logic Toolbox is capable to generate 3D surfaces that help us analyze the performance of the system. These surfaces can be represented as well by varying whichever two of the input parameters, the other one remaining constant, as it can be clearly observed from Figure 6.

Even in this situation, the expert may not be satisfied with the system's performance; in this case, additional membership functions can be added, for example for the universe of discourse of the number of stands s parameter. As a result, the number of rules must be modified, in the sense of its increase, in order to give a better accuracy of the system, and then the output data must be compared with the ones previously obtained. Broadly speaking, the tuning of a fuzzy expert system is a greater consumer of time than fuzzy sets determination or rules construction (Pîslaru, Schreiner, & Trandabăţ, 2010).

Figure 6. 3D images of the output variable

Discussion and conclusions

In the paper it is presented in a synthetic way, the results of the approach and procedures for the quality assurance process at a car wash station. The paper supports the computational techniques represented by an expert system using fuzzy logic as a starting point in the elaboration of quality assurance procedures. Computational techniques are considered a step forward in service quality assurance. Using computational techniques is another way to manage a business. Even though the proposed case study brings to the reader a lot of information about fuzzy logic, it has been tried to address them in a "friendly" manner, so understanding the problem would not raise great difficulties.

The novelty that the research is represented by the fuzzy expert system of quality assurance process which is characterized by a very high degree of complexity, case in which the adoption of such computational techniques proves its efficiency. Thus, the work contributes to quality improvement of service management using fuzzy technique which in economic terms translates in time and money savings.

The case under discussion is a simple one, but the real processes (production, services, etc.) are characterized by a very high degree of complexity, in which case the adoption of such computational techniques proves the efficiency it eventually translates into time and money savings. The present period is characterized by profound scientific and technological transformations. The volume of information doubles every 20 years, and technologies are replaced after only four years. Knowledge-based society is a reality, and continuing education is one of the most effective solutions to remain competitive.

Abstract. *When considering emergency situations, the question arises on how to manage the vehicles used then. Dealing with emergency situations usually involve quick reaction which would influence a lot of people being faced with such matters, as floods, earthquakes, hurricanes or terrorist attacks. Typically, both evacuation and response to the problem involve massive movements and a wide range of issues that need to be addressed. One of the notions of great concern is how to use available tools and how to make evacuation as flawless as possible. The tools involve available means of transport, such as planes, drones and airships, trains, road vehicles such as cars, coaches, buses, but also trams and trolleybuses, and boats of various kind. Those may prove both extremely comfortable and useful means of evacuation and unfortunately, equally effective and threatening means of terrorists' massive attack tool. When considering the former case, one needs to address such issues, as managing the fleet in use, problems with infrastructure or with people skilled to operate them, as well as panic issues. When considering the latter one, one needs to consider distraction impact, the panic that would rise, the need to block the attack and to need to evacuate people. In order to be able to face the challenges, one ought to be able to use the tools to manage all the fleet that is used in emergency situations. The tools that may help deal with such situations are the ones that would cover gathering the information about each of the vehicle. They should also offer the possibility to update such knowledge, as well as pass selected information to other bodies and receive feedback from them. Moreover, there is the approach towards managing the vehicles and towards to priorities set in an emergency situation. The hereby article presents the overview of the available tools and approaches towards dealing with the emergency. The Authors try to describe possible ways and methods in use when facing the emergency, together with the suggestion which option appears to be the most suitable in case of particular means of transport and the situation involved. The Authors are aware there is no one perfect pattern of conduct to be used in every case, however, they hope their work would be of some assistance to those who are responsible for taking decisions in the situations that are both extremely stressful and dangerous.*

Keywords: *managing vehicles; transport; emergency situation.*

Introduction

When considering the issue of emergency situations, the question arises on how to manage one of the means used when such a situation takes place, that is, the vehicles. Dealing with emergency situations usually involve quick reaction which would influence a lot of people being faced with such matters, as floods, earthquakes, hurricanes or terrorist attacks. Moreover, it concerns the cooperation of many parties; as it is highlighted, "Emergency response usually calls for the cooperative efforts of a broad range of community agencies. Typically, police, fire, search and rescue teams, ambulance corps, and backup health facilities work together, but other support services may be called upon to assist as required by circumstances" (Granot, 1997, p.305). That creates the network of numerous people involved in the process who need to respond to the situation but also, to the expectations of the people involved; as it has been observed, "high expectations of public and stakeholders in emergency and disaster management require effective use of resources by collaborative networks" (Kapucu, Arslan & Demiroz, 2010, p.452).

Typically, from the perspective of a body or bodies which are to manage reaction in the given area, both evacuation and response to the problem involve massive movements and a wide range of issues that need to be addressed at the same, or almost at the same time. One of the notions of great concern is how to use available tools of fast evacuation and how to make it as flawless as possible, as was in case of the systems mapping for technology in CBRN response (Hancox et al., 2017, p.111), joining the response of various agents (police, firefighters, hospitals etc.) into one information platform. The tools involve available means of transport, such as planes, drones and airships, trains, road vehicles such as cars, coaches, buses, but also trams and trolleybuses, and boats of various kind. Those may prove both extremely comfortable and useful means of evacuation and unfortunately, equally effective and threatening means of terrorists' massive attack tool.

When considering the former case, one need to address such issues, as managing the fleet in use, overcoming the shortcomings of the emergency situation, such as lack of power, problems with infrastructure or with people skilled to operate them, as well as such challenges such as panic among the citizens or people who found themselves in the area where emergency has taken place. Therefore, what needs to be known from the start is the updated information on exact state, position, number of the vehicles, their location, mechanical requirements, such as power in use (petrol, electric energy etc.) as well as the list of people able to drive, or operate them; such list would offer the possibility to contact such people as quickly as possible, although the challenge arises whether everybody would agree to be enlisted for such reasons (as this is not military force, some would be afraid, others might expect extra funds for being on standby; also, as such vigilance would require updating one's location whenever it has changed – for example, due to holidays, business trips or training – some could be discouraged to participate). Also, the individual's drive for self- managing the problem ought to be taken into consideration: not everybody will listen to and follow the procedure, some people, despite previous plans, would like to take the action into their own hands; although that might prove useful, in some situations such as evacuation, such an approach might prove harmful and disturbing; it sometimes is in case of reaction to the danger of fire – the attempt to distinguish it oneself may win over calling the appropriate services (Whales & Thompson, 2013, p.94). One might ask, whether such behavior pattern would not

override planned activities.

When considering the latter one, that is the case of terrorists' attack, apart from the problems indicated above, such as the location of the vehicles, fuel, people to operate, infrastructure etc., one needs to consider the issues such as distraction impact, panic that would rise, the need to block the attack and to need to evacuate people from the endangered area as fast as possible. Panic is a greatly important issue that may not be forgotten, as it influences not only the individuals exposed to the emergency, but being highly contagious, it spreads among the crowd easily, causing chaotic, sometimes dangerous behavior that is impossible to be fully predicted and therefore, almost impossible to be steered.

Taking all the above into consideration it is to be appreciated how collecting and operating data that may prove useful when managing the emergency is crucial for the situation to be dealt with efficiently. It is especially appreciated in case of using the tools enabling the evacuation, the vehicles, and at the same time, using the skills of the people involved in the situation. What is more, it is not to be forgotten how important the planning and forecasting is, especially in the situations that involve numerous people and may happen suddenly.

Summing up, managing the fleet to be used in the emergency is the task requiring careful planning, involving many bodies, forces, agencies and citizens of the area the situation has taken place and therefore, it is quite a difficult task. However, some of the issues concerning it may be pre-planned, and thus it may appear to be somewhat easier to deal with the case.

The research methodology followed in the article is based on analyzing the contents of the documents and scientific materials (reports, articles) understood as "the analysis of the content as reasonable, systematic and analytic reading/ perception of the content" (Szczański, 2012, p.83). There are two types of documents content analysis; there is "internal analysis focusing on learning the document content, profound understanding and explaining as well as distinguishing major elements, leading thoughts and their mutual relations from the context" (Łobocki, 2005, pp.222-223). There is also external analysis, "focusing on time, conditions of creating the document, and its identification of the author and the reader for whom it has been created or its potential influence on particular situations and happenings" (Łobocki, 2005, pp.222-223). The hereby text was created on basing mostly on internal analysis of relatively short content; following Apanowicz's belief that "the goal is to receive specific data on effects of the activity, process or organization-economic system elements. Document content analysis may be limited to setting an actual state, they may also help to collect data needed to forecast the future state" (Apanowicz, 2000, p.131). Hopefully, such an approach will help to build a greater picture of contemporary solutions, challenges, and chances of managing vehicles used in emergency transport.

Managing vehicles in an emergency

In the times of crisis, various types of vehicles would require different means and methods, appropriate to their conditions of use and the requirements needed. However, there will also be some of the issues common for each type of transport, such as the following:

- some of the means to collect necessary data
- some of the means providing required operating staff
- some of the methods to provide the evacuated with the appropriate information

As far as the means to collect necessary data is concerned, it seems the approach launched in case of smart cities may be of great assistance. It concerns collecting the data of the ordinary traffic in the city using cameras, sensors, and detectors, and passing the information to the traffic participants via radio, internet, mobiles, variable message signs etc. Obviously, it cannot be used in case of all the transport means, air transport would be able to use it means, but road transport may profit from such solutions in total, and rail and inland transport may use at least some of the abovementioned means of communication.

Also, it is important to highlight the obvious, that is that the message ought not to be long and sophisticated: short, clear information about the nature of the problem (it is another concern whether in all circumstances the information should be completely true in that part), the provided means and location of evacuation, preferably method (e.g. how many people on board, the reassuring information that all requiring will be taken and evacuated etc.) of leaving the endangered place.

As far as the means providing required operating staff are concerned, it appears to be a good idea to stretch the military approach over the people owning the required skills. It seems obvious to take their opinion into account, as not everybody would feel they need and should be always ready to take part in the evacuation or else, endanger themselves when they could be far from the problem. However, there are many people willing to participate in official or semi-official military groups such as National Defense forces and perhaps their members would be interested in volunteering into the expert's list: the list of professionals whose skills could be the answer to the evacuation issues in case of the emergency. Such list, available to the coordinators of emergency offices or emergency teams, could provide the solution to the situation, where there are people to be moved, there are transport means available, such as a train, but there is nobody declaring the knowledge on how to operate the vehicle. The idea is not new, it was used before and is currently used, however, in somewhat different form. PMG, Economy Mobilization Program, is designed for the enterprises, not individuals, and prepared on the basis of the Act of 23rd August 2001 on organizing tasks for the state defense, realized by entrepreneurs (Journal of Law no 122, item 1320 with amendments) and on the basis of the Decision of Ministry of Defense on preparing the plan of realizing the duties resulting from PMG (Journal of Laws of MON, Decision no 331 MON from 7th December 2016). The document is prepared every four years for the next decade, it is classified and its goal is to maintain safety and providing the means for appropriate forces, such as Police, Army, etc. It is to enlist entrepreneurs considered important for the economy and they are to create the chain of resources provided to the Army. Such work is paid and reported annually (<http://www.milwomen.pl/aktualnosci/program-mobilizacji-gospodarki>). Such program could also enlist the name list of professionals willing to help in the emergency and be paid for being on standby, which could potentially compensate for the inconveniences of having to report every move in and outside the country.

As far as the methods to provide the evacuated with the appropriate information are concerned, the means all branches of transport could use are of course radio, Internet platforms, text messages sent to everybody in the vicinity, all the applications the mobile

users could download to be updated about the emergency (it is suggested it should be offered for free, but such option is to be discussed in the future). Direct contact with all the exposure to the emergency could provide their fast and relatively calm reaction, however, it would not exclude the role of the coordinators. Their common contact, as well as their contact with the evacuated, is extremely important, however, the tools used on such communication channel would not differ much from the abovementioned ones; perhaps it would be more standardized, as mobiles and emails would constitute the basis of their communication.

Other issues, such as the role particular means of transport could serve in the evacuation, the requirements of its use in such situation and the danger it could create when used by the terrorists should be discussed separately for each means of transport taken into consideration.

When considering air transport means to be used in emergency situations, one may consider planes, but also drones and airships. What all those means have in common is the possibility to see the whole picture, offering the data to analyze the whole issue of evacuation at once. As for planes, they offer the possibility to evacuate quite a lot of people at once, they also offer the chance to travel to and back the quickest. Air transport has also one more advantage to consider from the perspective of evacuation planning, sometimes forgotten. This is firefighting equipment available on the airports. As it is stated: "Airport administration spend millions of dollars providing and operating firefighting equipment, hoping that they will never have to use it." (RFFS) (Kazda & Caves, 2010, p.427). Rescue and Fire Fighting Service is the team that could support other parties in organizing the crowd, monitoring people flow or immediately responding to spreading the fire of water.

As for perceiving airplanes as a potential terrorist's tools, one need to take into consideration the scenarios, when the plane is used to attack the crowd (hitting the building as on 7/11, massacring the crowd on the land etc.) or else, when the plane is hijacked and people traveling with it do not reach safe destination but start their run for life.

When analyzing air transport means, one cannot forget the airships. Slower than planes, yet offering the amazing capacities to start and land from literary everywhere, not requiring so numerous infrastructure solutions as planes, airships may be used as great means to facilitate evacuation. They offer the possibility to evacuate many people at the same time, however, they are more dependent on external conditions than planes. Moreover, one cannot forget their slowness. What is more, as the vehicles using explosive fuel, they may be easily turned into terrorists' weapon and as such prove a real danger to everybody being close to them. Nonetheless, it is highlighted that despite their advantages, "the success of airship transport or any form of airship operation depends to a very large extent upon the efficiency of the ground organization and equipment. In the past, the lack of appreciation of this fundamental fact has been the cause of many of the troubles encountered and to a large extent the reason for the comparatively slow development of the airship." (Scott, 1930, p.235). In case of evacuation, the transport infrastructure is of somewhat less importance than during its development, however, one needs to remember that airship could offer the possibility to supplement the solutions offered by planes.

Other tools supplementing the evacuation procedure are drones. Those smart machines, operating with quite noticeable speed, offering rather small load and size, may constitute great tool for gathering the data concerning the situation, following evacuation process step by step round the clock, giving information on the current state of operation, upcoming dangers, difficulties, ways of coordinating parties taking part in particular operation stage or stages, transporting documents if needed, making films, photos etc. One of the machines used in emergency situations was described by Hasam, Newa and Ahsan (2018), who highlighted its speed, compactness, and equipment: "an aircraft type autonomous portable drone suitable for surveillance and disaster management. The drone is capable of flying at a maximum speed of 76 km/hour. This portable drone comprises five distinct parts those are easily installable within several minutes and can be fit in a small portable kit. The drone consists of a ballistic recovery system, allowing the drone landing vertically. The integrated high definition camera sends a real-time video stream of the desired area to the ground control station. In addition, the drone is capable of carrying ~ 1.8 kg of payload" (Hasan, Newaz & Ahsan, 2018, p.147). On the other hand, gathering information means may be used by both good and bad hands, offering similar intel to the terrorists and warning them against any undertaken action or activity. Drone, is a great supporting tool, may as well be considered as great, dangerous weapon.

As far as road transport means used in evacuation process are concerned, they are usually the ones to be taken into consideration first when responding to evacuation planning. Road vehicles, whether we consider buses, coaches or cars, are the easiest to get due to their number, also the biggest number of people have, even if only rudimentary, knowledge how to operate them, and the infrastructure needed to use them may also fragmentary, even partly destroyed. The greatest concern is fuel, but it is also among the easiest to obtain due to numerous stations (at least, at the level of evacuation). Sadly, those advantages may also prove them being chosen as a quick method of massive harm, such as in some cases when a truck was used to kill, being driven into the crowd – this aspect cannot be forgotten. However, there is one option that first of all solves the problem of people needed for operating the machines and second, eradicates road vehicles from the range of terrorist: those are unmanned vehicles. The trend is quite visible: "The unmanned robotic vehicle industry is largely driven by government requirements, both military and civilian. Unmanned service robots are also found in commercial applications such as pipeline surveillance, crop monitoring and fish school location at sea" (Bloss, 2009, p.13). Road vehicles without the driver would provide easier to access means of evacuation and if protected properly, would not be possible to be used as a terrorists' weapon. The thing to remember when creating and using them, though, is appropriate IT safety measures.

In case of railroad transport means, their popularity offers great evacuation possibilities, however, limited with the already described issues with operating staff willing to participate in the evacuation process and the case of fuel. One of the fuels needed is electric power and this is usually cut off first in case of the emergency, leaving the means immobile or worse, blocking the railroad. That is why it is not easy to consider railroad vehicles as the first means of evacuation, however, in the situation when the power is not cut off yet and the need to leave the area is urgent, perhaps even just for the first mile of evacuation road such means of transport would prove useful, although then they need to be changed into other types of vehicles.

As far as inland means of transport are concerned, they are usually not mentioned, if not forgotten, in the majority of evacuation plans. Perhaps it is due to the case this is not the most popular means of transport, as well as not situated everywhere; however, in the areas boats are available they ought to be considered as an evacuation means, even if only supplementary, as they may help solve the panic problem of people left behind, because there was no place for them in the buses.

Summing up, all means of transport available in the area ought to be considered to be used in evacuation path planning and executing, obviously taking into consideration their strong and weak points so as to avoid the risk of creating the plan impossible to implement and to limit, if not eradicate, potential panic of the people involved.

Conclusions

The issue of evacuation is the complex task that requires careful and detailed planning as well as multiple plan variations so that majority (if not all) scenarios are predicted and well prepared for. In the process of creating appropriate evacuation path, it seems a good idea to consider all the potential ways of rescue and all possible means of transport that could be used in the given location. What need to be considered, though, are the possibilities offered by every kind of available machines, as well as the shortcomings one may face when deciding to use them.

What seems potentially best solution is to divide the planning process into at least two stages and first consider the challenges to answer that are common for all possible solutions, such as lack of operating staff, number of vehicles, means to collect and spread the information necessary for smooth evacuation process. Secondly, it appears to be prudent to consider the possibilities offered by particular means of transport available in the area, as well as dangers they would create when used as the terrorists' means. When such data are cross-referenced with the information about the population of the area, the number of people currently in the vicinity, the nature of the danger they need to face, those may result in appropriate evacuation plan that may work best in the given conditions and help to save lives and wellbeing of numerous people faced with the emergency.

What needs to be highlighted, though, is the general idea of planning, preparing for the situation every one hopes would never happen. As it has already been observed: "Look at the way in which public transport is used for evacuation of personnel in the event of emergencies or disasters. Although the work of the emergency services is well documented, it seems that the important task of evacuation, and particularly the planning, operation, and documentation is often overlooked. (...) This is due to the sometimes unpredictable nature of the transport system due to roadworks, road closures, accidents, etc. Special events, such as football matches, are a regular occurrence, which includes the need to move large crowds to and from the venue. This strategy and planning can be used in the evacuation of people in the event of a disaster" (Scanlon, 2003, p.428).

Planning and trying to prepare for the unexpected seems to be the most important part of any successful evacuation case. It is visible in already analyzed evacuation cases, as it was in case of analyzing floods issue; it was observed, that the flood victims who were given evacuation notices were five times more likely to evacuate (Soon,

Kamaruddin & Anuar, 2018, p.134). It seems impossible to be prepared for anything and everything, but as those are the lives that are at stake the authorities need to do all they can to protect people in need and mostly, to prevent the emergency, and if that is not possible, to protect people against as many of unwanted emergency consequences as possible. Evacuation is but the first step, yet it seems crucial for people to believe the problem might be solved; carefully prepared plan, including the scenario to use particular means of transport and people willing to help evacuate other, is the most important stage of the operation. Therefore, appropriate managing of the vehicles used in an emergency situation would appear the key element for successful evacuation process and that in turn cannot be performed without proper analysis of each and every potential solution involving all means of transport available in the area.

Abstract. *While conducting our ordinary social and economic activities, we rarely stop to ponder what would happen if air transport opportunities (and its services) suddenly became largely limited. We neither realize the reasons behind it nor are we aware of its potential consequences. That is why – when preparing business strategies – air transport operators develop modern models of company operations, which account for emergency situations. A rapid response to emergency situations and skillful implementation of modern solutions are the foundations of operational and financial sustainability of enterprises. The aim of the article is to present factors generating emergency situations, which may substantially limit air transport operations, and their likely consequences. The Authors are aware there is no one perfect pattern of conduct to be used in every case, however, they hope their work would be of some assistance to those who are responsible for taking decisions in the situations that are both extremely stressful and dangerous.*

Keywords: *air transport; emergency situations; air transport operators; crisis; factor's analysis.*

Introduction

Aviation has developed its response to the growing demand for passenger and freight air transport. The twenty-first century features rapid development of societies who are willing to migrate for work and study purposes, explore the world and grow wealthier. Thanks to the above and the development of a broadly understood communication, including communications and air transport, the concepts of time and distance have disappeared. Space is perishing; the distance is becoming non-distant. We are living in the world that is a global village, where everything is happening at the same time and where everything is affected by events of various origins.

Problem-solving very often requires us to use the most accurate research methods for various disciplines: Economic sciences, management, computer sciences, and statistics. The choice of methods is dependent on the agreed research procedure. Accurate methods are accepted on its every level what allows to aim the goal of given investigation. According to the given information, this paper includes the following research methods:

- System analysis
- Other countries' experience – analysis of the results

- Potential's comparative analysis of chosen air carriers

Basing on the investigation results of other authors who publish their papers in this area of research, it must be said that previous studies contributed to creating advanced research methods. It also showed that the area of the cargo air transport still faces many problems.

The nature of an emergency situation

With a view to delineating the nature of an emergency situation, we should present its definition set forth in the National Programme of Civil Aviation Protection which presents an emergency situation as: "a situation in which safety is jeopardized by an act or an attempted act of unlawful interference in civil aviation" [www.prawo.sejm.gov.pl]. Unlawful interference in civil aviation, in turn, is specified by the legislator as an illegal and deliberate act consisting in:

- a) use of violence against a person on board an aircraft in flight;
- b) destruction of an aircraft in flight or causing damage to an aircraft preventing the flight or jeopardizing the safety of the aircraft in flight;
- c) introduction on board an aircraft of an object, device or substance which may jeopardize the health or life of passengers or crew, or destroy an aircraft or cause damage to an aircraft preventing the flight or jeopardizing the safety of the aircraft in flight;
- d) unlawful seizure of an aircraft, with crew and passengers on board or without them, also for the purpose of using the aircraft as a device for an aerial terrorist attack;
- e) destruction or damage of onboard or ground equipment, their disruption, or the use of violence against their operator in the event when this seriously disrupts air traffic or jeopardized the safety of the aircraft;
- f) communication of false information which poses danger to persons and property in air communication;
- g) use of hazardous devices, substances and objects or weapon, the use of which may:
 - destruct or seriously damage devices at an airport;
 - destruct or seriously damage an aircraft;
 - disrupt air traffic or airport operations during the violent act directed against a person at an airport or serving civil aviation, which results in or may result in serious injuries or death (www.nowastrategia.org.pl - date of access: June 30, 2018).

Factors generating emergency situations in air transport

Due to its utility values and the benefits of long-distance passenger and freight transport services, air transport is the leader of the transport sector. Nonetheless, in addition to advantages, transport aviation also has its (major) disadvantages, as demonstrated by the presence of a group of factors disrupting its smooth operation. The morphological analysis of the factors is shown in Fig. 1.

*Figure 1. Factors Generating Emergency Situations in Air Transport
(Wąsowska, 2015, p.5498)*

Aptitudes, training, and health condition of flight crews

In accordance with the binding regulations, the pilots and cabin crew members must be examined by a psychologist at least once every six months (following certain rules and procedures, depending on the scope of responsibilities). Quoting the article by Z. Banachowicz and D. Grześkowiak entitled "Zagrożenia bezpieczeństwa we współczesnych portach lotniczych i na pokładach statków powietrznych" ("Security threats at contemporary airports and on board aircraft"), psychological assessment of pilots should be conducted minimum once per six months as human mental condition is subject to frequent changes and, therefore, a team of psychologists (and psychiatrists, if needed) ought to supervise it. According to the authors, neglecting these affairs led to the Germanwings' Airbus A320 catastrophe in the Alps.

The investigation in the case proved with a high degree of probability that the co-pilot, who locked himself in the cockpit and took over the plane after the captain had gone to a toilet, acted intentionally and had been prepared. His unauthorized and unfounded flying below flight altitudes in the mountainous area of the Alps resulted in the plane crash. The results of the investigation demonstrated that this man had mental problems, which could have triggered his destructive behavior.

Having regard to this event, the authors unanimously highlight that every pilot should have his individual psychological profile drawn up, depending on his age and seniority (as a pilot – as of the time of training, as an employee – as of the start of employment with a given employer and airline) and on one's mental and physical features. Examinations conducted year by year would allow one to detect all and any changes in the profile caused by, for instance, life failures, allowing immediate response to emergency events.

The remaining cabin crew members (flight attendants) are required to comply with their roles. The authors reckon that they too should be given extra training so that, in the event of a permanent or temporary disability of a pilot, they are ready to take over some part of professional responsibilities of pilots, such as to communicate with ground forces/service providers or to control an airplane or its devices, to some extent (Banachowicz & Grześkowiak, 2015, p.669).

Air traffic organization – Air traffic management

Air traffic management is providing an adequate level of air safety by striking a balance between the ever-growing number of flights and the available volume of controlled space.

The term Air Traffic Management (ATM) was created in the process of aviation development and evolution and on the basis of the theory of management. Its essence are “all undertakings accomplished on behalf of the state by a special specialised organization, in cooperation with other entities, aimed at ensuring aircraft safety, maintaining well-ordered air traffic flow, and using airspace in the most efficient manner” (www. mi.gov.pl (date of access: June 30, 2018)).

The underlying elements of air transport management are:

- planning;
- organizing;
- coordinating;
- controlling all resources of air traffic management potential, which includes, above all, ground personnel, cabin crew, and all technical infrastructure of the system of air traffic service providers.

ATM consists of the following activities:

- provision of air traffic service providers;
- management of air traffic flow;
- management of airspace.

Rapidly progressing globalization and integration within the European Union have resulted in the need to take up activities which would synchronize and liberalize civil aviation. Their scope appeared to be very broad, for it covers the rights of passengers, matters relating to safety, environmental protection, infrastructural needs, and air traffic management.

Air transport development spurs growth throughout the economy – the idea of sustainable development. This is the main objective of the European Commission, in line with which a reform of the system of air traffic management in Europe was developed

under the name Single European Sky (SES). Given the significant fragmentation of airspace in Europe and the need to cooperate in terms of operations and system adaptation to the present-day movement situation in the airspace, the concept turns out to be extremely important.

The multi-aspect approach to air navigation is an opportunity to attain the following goals within a few-year period:

- increase in airspace capacity;
- the decrease in costs of air navigation service providers;
- the decrease of aircraft operations' negative effect on the natural environment;
- safety [Ibidem] .

Weather conditions

The specificity of air transport is its dependence on temporary weather conditions rather than climate changes, for the current meteorological situation is most important, above all, at airplane take-off and landing. Aviation infrastructure, in turn, is subject to the same climate changes as a building or technical infrastructure. The primary risk for on-ground planes are gusts of strong wind and icing. The remaining atmospheric phenomena, such as downpours or heavy snow, may delay operations and have a negative effect on transport regularity – but they are not a real threat. Nowadays, air transport is prepared to operate under the above conditions.

Fog or volcanic ash emission results in a complete loss of visibility, which as a consequence may lead to discontinuance of transport functions [www.klimada.mos.gov.pl] - this happened at the end of March/beginning of April 2010. The year 2010 did not call for optimism. The economy only started to have a chance of being profitable after an unexpected economic downturn, and here a new crisis – the so-called volcanic crisis - emerged, particularly affecting the air transport. The effects of volcanic eruption covered nearly all Europe, grounding not only air transports but also European Union economies and communities.

The Agency of Aviation Supervision – Eurocontrol – announced that around 300 of 29 thousand flights in Europe were canceled. The International Air Transport Association (IATA) estimated that daily downtimes cost airlines 200 million USD. Tim Clark, the head of the Air Emirates flying passengers from Asia to Europe said: ...”Should the ban on flights be upheld, the aviation industry will collapse” (www.wyborcza.pl (date of access: August 2, 2018)). Lufthansa lost – 200 mln Euros, British Airways – 20 mln GBP, whereas the above mentioned Air Emirates – 50 mln USD.

Air transport is used in the economy primarily for long-distance shipment of fresh foods, medicines, electronics and car parts for production lines, etc. Particular impediments were seen in the movement of goods along the following routes: Asia - Europe and Europe - America.

Losses were recorded not only by the aviation sector. Alcohol manufacturers, such as Johny Walker or Hennessy, and a luxury shoes and bags producer Salvatore Ferragamo with over 130 stores across all airports, also experienced difficulties.

BMW car manufacturer announced that in view of the situation the production of X5 and X6 models in the South Carolina factory (USA) may have been withheld because they were not receiving any gearboxes from their German plants. The same declaration was made in China by Japanese Nissan, as it was not getting its parts from Ireland. Such production halting was also intended by Daimler.

In Hong Kong, commonly referred to as the window overlooking the South-Eastern industrial districts of China, the goods waited between 10 and 14 days before they could be loaded on board of aircrafts. The luxury Hong Kong districts lacked French cheese and Belgian chocolate. LG plants' warehouse was full of electronic devices due to zero transport opportunities across Europe. Thousands of roses died at Kenyan airports and tons of pineapples and papayas intended for Europe went off in Ghana. In China, in the Guangdong province, many plants manufacturing jewelry and watches ceased operations.

In Poland too we could face a shortage of medicines which were not registered in the country but imported upon the consent of the Minister of Health, upon request. These medications include American and Canadian preparations for drug-resistant tuberculosis patients, interstitial cystitis and tumors. As airlines did not take on any new orders, at the time of service renewal the rates could have doubled.

In accordance with the European Commission's 2008 data, air transport includes only 0.6% of the total mass of goods in the EU foreign trade; nonetheless, as their value was 576 billion Euros – in reality, it accounted for 20% of the value of total EU foreign trade.

In the face of danger, the German Minister of Economy Rainer Bruederle said: "Many industry sectors rely on air transport. If in a global world, supply chains are suspended for longer periods, we will have a serious situation [www.wyborcza.pl]". Germany, as the largest European exporter, has special reasons to be concerned for – to quote the main economist of the German Economic Chamber, Volker Treier, ... "a tie-up in flights may cost Germany as much as one billion Euros per day" [Ibidem].

Air postal services also faced multi-hour (between 24 and 72) delays in air mail deliveries across Europe and few-day delays in mail sent both from and to Europe elsewhere. At present, airmail accounts for 70% of all mail shipped from and to Poland. The delivery of all domestic correspondence and courier packages was halted. The carrier in charge of mail-air flights for Poczta Polska also ceased them. Against such background, Poczta Polska tried to substitute air transport with road transport services whenever possible and – across the country – it partly succeeded. Upon the implementation of emergency procedures, similar solutions could be adopted in the countries with road-based postal routes, i.e. in Germany, Russian, Czech, Slovakia, Lithuania, and Latvia.

Travel agencies are yet another group suffering from the closure of airspace. The Vice-President of the Polish Chamber of Tourism (PIT), Paweł Niewiadomski, estimated that during one weekend 20 charter planes did not take off and, consequently, some customers terminated their agreements, other waited for departures, and yet others rescheduled their trips. Travel agencies were incapable of conducting an exact assessment of their losses. Alfa Star calculated its daily losses at 200 – 400 thousand PLN, whereas Rainbow Tours – at around 100 thousand PLN.

Another group facing losses consists of hotel owners. The Head of the Economic Chamber of Polish Hotel Industry, Krzysztof Wojtkiewicz, stated: "...the hotels will be hit hardest by lower numbers of business customers – the group that is most profitable for hotel owners in large cities. This week we were to be fully booked here in the capital city but now customers are canceling their stays[Ibidem]".

Airport infrastructure

Airport infrastructure is composed of everything related to the fitting of the area referred to as the "airport", i.e. parameters of the runway – its length, width, surface condition, other taxiways, signs and lighting, radio-detection devices, communications equipment, devices protecting against unauthorised access to manoeuvring areas of people, animals, and vehicles. Boeing 737 – the most popular communication airplane – may safely land on or take off a ground runway (e.g. grass) of only 1,500 m in length, without the support of any airport equipment. Thus, modern planes are not so closely related to airports anymore – the only exception is refueling. Modern airports are highly complicated organisms which are not limited to airplanes as such. A key issue for all departing and arriving planes may be airports' immediate surroundings, such as nearby mountains, high buildings, chimneys, masts, power lines, or a motorway crossing the runway, as in Gibraltar (www.polot.net - June 26, 2018).

Aircraft seizures

One of the most interesting aspects of air transport threats is hijacking planes. The reasons behind the below-described events depend largely on the ingenuity of those committing air offenses. What should be underpinned is that they do not always have a tragic end – sometimes they are even quite amusing. With respect to the above, we may ask ourselves the following question: What would make one hijack a plane? Well, everything depends on the purpose, but the objectives have changed over the years. Over the period 1945-1989, it was the willingness to escape West, to lead a more normal life. It mainly affected the countries of the so-called people's democracy, i.e. Europe, People's Korea, People's China, and Cuba. Hijackers were madmen who intended to do no harm to anyone.

A different case is an incident that happened on board the McDonnell Douglas DC-10-30 plane during the FedEx Express 705 flight on 07/04/1994. The aircraft carried electronic devices from Memphis, Tennessee to San Jose, California. En route there was an attempt to seize the plane by a dishonest employee of FedEx – Auburn Calloway, who wanted to crash it. He developed a plan to claim compensation on his life insurance (about 2.5 million USD) on the basis of false data, which he wanted to spend on his children's education. One condition of obtaining this amount was Calloway's death as a result of an accident. He smuggled on board the unlucky flight a set of hammers and a crossbow in his guitar cover, thinking that any injuries done with their help would be impossible to detect during possible autopsies of the crew members. The catastrophe was to take place by heading the plane to the main FedEx seat in Memphis. During the flight, the assailant violently entered the flight deck. He attacked the co-pilot with his hammer, who then lost consciousness. However, he did not manage to make a blow to the captain, as he attacked Calloway instead. They started hand to hand combat. The co-pilot regained consciousness and rapidly steering the plane tried to knock down the

attacker with the hammer, scuffling with the captain. Luckily, they managed to restrain the assailant and land. Auburn Calloway was sentenced to a life sentence. The three crew members survived the attack of the madmen, their injuries, however, were so serious that they could not return to flying.

Terrorist attacks

In a contemporary world, a terrorist attack is something passengers fear most. A history of aviation provides numerous examples of such attacks – I will present just two of them.

On December 7, 1987, an Avro RJ 100 plane was serving a scheduled flight from Los Angeles to San Francisco. Shortly after the aircraft departed from the airport, one of the passengers, David Burke, entered the cockpit and shot two pilots. Within 25 seconds, the airplane crashed in a field nearby Paso Robles. Forty-six people died. At the scene of the disaster FBI found a Magnum 44 pistol, still in hands of a terrorist – a previous US Airways employee, who had been dismissed a few days before for stealing a cocktail. The investigation proved that the plane was not chosen randomly because that was the flight which his superior, Raymond F. Thomson, who personally dismissed Burke a few days earlier, flew to work every day. That day Thomson was also a passenger on a 1771 disastrous flight.

The most popular case of a terrorist attack was the one over Lockerbie, Scotland. On December 21, 1988, a bomb was placed in a suitcase on a flight of Pam Am Boeing 747. During a detailed and expensive investigation, the reasons and a course of the attack were established. There are no doubts regarding the method of the attack, but there are still some questions unanswered left. Two agents of the Libyan intelligence service were blamed for the attack - Abdelbaset Ali Mohmed Al Megrahi and Al Amin Khalif Fhimah. The attack was conducted in retaliation to American bombardments of Tripoli and Benghazi in April 1986, which nearly killed Muammar al-Kadafi. After the attack, the Pan Am airline was massively claimed for damages by lots of passengers what resulted in declaring bankruptcy by the airline. This is the attack which caused the tightening up of air transport safety procedures. Subsequent procedures were drawn after a series of attacks on the WTC and the Pentagon.

On October 31, 2015, a Russian airline plane departing from Sharm-el-Sheik to Petersburg crashed on a desert of Sinai Peninsula. 224 people were on board, no one survived. The cause of the catastrophe was a bomb placed by the members of the Islamic Country (IS). This statement was not confirmed by the Egyptian Ministry of Civil Aviation. However, the Federal Security Service of the Russian Federation confirmed in its report that there was an explosion on board (www.fakty.interia.pl (date of access: June 26, 2018)).

Aircraft shot down

The history of aviation marks six aircraft shoot downs three of them will be presented in this publication.

The first one happened on July 27, 1995. Two Bulgarian fighter aircraft MiG-15 shot down a Lockheed L-149 Constellation (4X-AKC) El Al airline plane, flying from London to Tel Aviv, with stopovers in Vienna and Istanbul.

At 2.53 am the plane departed from Vienna, heading towards Tel Aviv. While flying over Yugoslavia, heavy storms caused an inappropriate change of direction finder. The crew was convinced they were flying over Yugoslavia, being within the reach of the Skopje radar. Meanwhile, the plane accidentally entered the territory of Bulgaria, as much as 60 km to the east of the intended airway. The same moment the plane was taken over by the Bulgarian fighters who started to shoot down the plane. As a result of extensive damage, the airplane crashed near the town of Petricz, near the Yugoslavian-Greek border. 58 people died altogether, passengers and the crew.

At the beginning of the investigation, Bulgaria did not want to take responsibility for the catastrophe, accusing Israeli pilots of unlawful invasion of Bulgarian airspace. Finally, Bulgarian authorities assumed responsibility for the catastrophe, admitting that the pilots acted too hastily shooting down the plane. Eventually, the authorities decided to pay compensation to the families of the victims.

The other shoot down took place on September 1, 1983. Boeing 747-200A flying from Anchorage, Alaska to Seoul, South Korea strayed off its intended course due to a navigational error and entered several dozen km on a territory of Soviet Union (Kamchatka) airspace. That was the area of big military bases and installations so the plane was shot down soon afterward by Soviet fighters Su-15, not even allowing it to leave Kamchatka airspace. No one decided to identify the plane or to attempt to bring it down to the airport or to bring it back to its course. 269 people died. Moscow authorities claim that it was a reconnaissance aircraft. Neither aircraft wreckage nor human remains have been returned.

The third shoot down took place on July 3, 1988. The American cruiser USS Vincennes shot down Iranian passenger airplane Airbus A300 carrying 290 people, over the Persian Gulf. Not a single person survived. By analogy to the above-mentioned catastrophe, in this case, no one decided to identify the plane carefully. In this case, the same scenario- first do, then think – was repeated. This incident brought disgrace upon the USA [Ibidem].

Conclusions

The rapid development of our civilization has a number of positive consequences. Nonetheless, we must bear in mind that its effect on safety is also noteworthy. Experience to date gained by the aviation industry with regards to safety is, on the one hand, to increase the level of safety of air transport travel, and on the other hand, to actively participate in the organization of the system at a broadly understood human-contemporary technology cooperation.

The events presented here above confirm the validity and rightness of the use of factors generating emergency situations in air transport to fight threats of various origins. Therefore, we can see a better future, though we ought to bear in mind that contemporary problems are the result of our previous choices, whereas our generation can take decisions today which will allow future societies to live in a safe and resourceful world.

Abstract. *International migration represents probably one of the most complex aspects of globalization and has seen various moments when migrating flows were created. International migration represents a process currently being into full expansion, process which has seen many approaches. The main question which reality imposes over migration is whether it can bring more benefits or if it is a burden on both sending and the receiving countries. The following article aims to answer affirmatively or negatively to each of the two scenarios and, also, to see the implications of this process for both the receiving countries and the sending ones. The research design and methodology starts from understanding the core of how migration works and its main features, so that readers may have an idea of how to understand the statistics which will be presented. The key findings of this paper should be the ones regarding profiling the current migrants and presenting the main benefits and risks for both countries of origin and destination. Many times migration is usually perceived as a process that leads to drops of wages, therefore it might create discomfort among native people already working in certain areas. Of course global competition means cutting costs, and that might mean cheaper workforce. But there is a much larger understanding behind this dynamic process. Migration policies play a huge role into the acceptance and integration of migrants. Finally, it is important to understand that migration, both voluntary and forced, is one of the key elements behind the economic globalization, and therefore should be analyzed not just in terms of numbers, but in terms of a deeper understanding so that researchers may finally give answers to its necessity in certain areas, and the proper tools to either eradicate, sustain or even encourage it.*

Keywords: *international migration; macroeconomic perspective; migration policy; global competition; immigrants influence.*

Introduction

International migration can be defined as a dynamic process at the world economy, with profound consequences over the sending or receiving countries. The core of analyzing international migration usually refers either to the factors that determine this process (1) or the continuity of this process (2), its intensifying and expansion.

There are 4 major theories regarding international migration, each based on several areas of research: economics theories, sociological theories, geographical theories, unifying (interdisciplinary) theories. The present article refers mainly to the economics theories regarding international migration, and their conclusions will be applied to the

current statistics and effects of this process, especially in the EU, but also it will take a look at the main pros and cons regarding immigrants.

Understanding migration

Migration is widely referred to as “the permanent or temporary change of residence” (Lee, 1966, p.46), or as a “movement of a person or group of persons from a certain geographical unit to another, surpassing administrative and political borders, with the desire of settling down on a permanent or temporary basis, in a different place than the one they came from” (Bauer et al., 2004, p.6). It is obvious that there are clear distinctions between internal and international migration.

Noja (2013) argues that there are some main characteristics that need to be addressed when spoken of migration:

- creating profiles of the ones who choose to migrate;
- identifying what are the main motivations that stand behind their decision;
- identifying the statute of migrants and the legislative environment in both sending and receiving countries;

Borjas (1989) argues that the economic approach of international migration refers to aspects that create a certain path of labor migration such as:

- identifying factors that determine the size and structure of the migratory flows;
- identifying ways in which immigrants adapt in a certain country;
- assessing the impact of migration on economies of both sending and receiving countries.

In regarding the basic analysis of this process, from the economic perspective there are three different ways to approach the subject in matter:

- microeconomic (or individual) perspectives describe the degree of autonomy (liberty) of a potential migrant, which is relevant in so far as the migrant has the capacity of deciding to remain in the receiving country or to return to the origin one
- macroeconomic perspectives describe the economic structures, political, social, demographic and cultural ones that can influence this process;
- other types of perspectives (theories) include analyzing social and symbolic ties between migrants, given by different family ties, ethnicity, religion etc.

The main 4 categories of migrants are labor migrants, migrants of family reasons, foreign students and refugees (or asylum seekers).

Migration in numbers

Between 2000 and 2015 the number of international migrants has grown significantly from 173 million in 2000 up to 244 million in 2015, with Europe and Asia having each approximately 75-76 million of them. The third continent in numbers is Northern America with 54 million migrants, but with the country that has the larger number of migrants, the US having 47 million. The countries that follow the US are Germany and the Russian Federation, having each 12 million migrants, although it is easily to argue that today Germany is clearly second place in this top not only because of the large number of refugees, creating a truly migrant flow in the recent years, but also due to the

state in which the Russian economy currently is, because of the economic sanctions. The fourth country receiving migrants is Saudi Arabia (10 million). (UNHCR 2015 Report)

Another significant fact is that most immigrants worldwide originate from middle-income countries (157 million in 2015), with this category being the fastest growing one, choosing obviously to live in high-income countries. In Europe, because of the positive net migration between 2000 and 2015 the population of the whole continent stayed in balance, and in Northern America 42 % of the population growth in this period is due to positive net migration.

Figure 1. Twenty countries or areas of origin with the largest diaspora populations, 2000 and 2015
Source: United Nations Report 2015

Last but not least, the ratification of the legal instruments regarding international migration provided by the United Nations remains uneven. By the end of 2015, only 26 Member States had ratified all five of the United Nations legal instruments. (UNHCR 2015 Report)

Figure 2. Twenty countries or areas hosting the largest numbers of international migrants

Profiling the contemporary immigrant. Global competition for qualified staff

There are various factors that contribute to the decision making process of a migrant. Many times migrants have a distorted image of the possibilities of finding a job in the receiving countries. In most of the times the misinterpret the possibilities of even finding a job at their destination point, and usually end up with a job that is less suitable for them, and underpaid, making their life even more difficult. Postelnicu (2013) argues that adding up travel expenses and notable distances it is easily understood that there are going to be huge differences between different types of immigrants.

This is one of the reasons why in Europe after the last significant wave of labor migrants (2008), it is easily understood that Europe has on one hand a wave of cheap unqualified labor force given by Eastern European countries, and on the other hand, it is the main source into producing qualified labor force because of the high number of foreign immigrant students studying in universities in countries such as the UK, Switzerland, Austria, Germany, France and Belgium. Countries like Russia, Ukraine, Poland and Romania are the main providers for Europe in both categories above mentioned, but Asian students significantly help raise these numbers as well. The total number of European migrants within the European space is over 40 million. Adding up the 8 million African migrants and the 20 million Asian migrants, it is easy to understand why migrants play an important role into the European economy.

Although the average age for migrants worldwide is 38, Europe has the youngest migrant population, the average age being 33-34.

The global competition for qualified staff has been translated into the “*brain drain- brain gain*” theories that can be found in several studies (Bhagwati & Hamada, 1974; Galor & Stark, 1990; Stark, 2003; Docquier et al., 2011) which basically state that immigration of high qualified labor force has negative effects over the sending countries, especially because this countries already lacking of proper high qualified labor force will have a reduced economic growth which will also scare/push away foreign investors. Also the loss of the high qualified labor force means that this people will not contribute at the tax burden in their mother country, but rather in their receiving countries, therefore the only contributors left are the ones that have less to contribute with, and so the economy is again suffering.

The only way to manage changing the negative aspects of losing high qualified labor force is with the intervention of the political factors which need to develop sustainable personnel training programs, thus helping and motivating this qualifying labor into investing time to educate future labor force and creating conditions so that the next generations will work in their home countries.

Benefits for the countries of origin

For the country of origin labor immigration has two major implications:

1. immigration modifies the size and structure (education, abilities) of labor force;
2. immigrants influence the consumption and the investments by remittance into their origin states contributing to the growth of economy and the reduce of poverty.

Therefore, many governments actively promote foreign employment for their citizens as one of their main strategies to increase economic growth, in some cases salaries being 10 to 20 times the value of local wages. Thus these earnings are far more important to developing countries than to the ones of destination, that are usually the developed ones. The total amount of money sent to the countries of origin was over 232 billion \$ in 2005, with most of them going not only to Eastern European countries, but also countries such as China, Philippines, and Mexico.

It is also a fact that temporary migrants send more money home, than the ones who are permanent migrants, and already have developed their own life there. As a consequence, the total amount can be influenced by level of connections between family members, religion, communities and traditions etc.

“International migration has a major impact on the sending countries economy, and especially on its national labor force, helping lower unemployment. This is a key factor in the growing of the economy.” (Cojocaru, 2010, p.14)

International migration might even contribute to political changes into these countries. It is the case of many Turkish, Portuguese, or Greek immigrants which used to work into Northern Europe in the '60's and 70's and returned to their countries of origin as the countries where changing their political environment.

Risks for the countries of origin

One of the main risks for the countries of origin is the fact that there might be created a social inequity between the population that benefits from foreign help, and the one that doesn't.

Also, another major risk is that it creates a bond between passive and active population, discouraging the passive ones into taking action in finding a job in the internal economy. Also, it might discourage the governments into taking proper course of action regarding restructuring the national economy. "The remittance of money does not usually find its self into being used for productive investments, but rather for basic consumption". (Cojocaru, 2010, p.345)

Benefits for countries of destination

Many countries have labor markets which are highly dependent on foreign workers, because they often fill jobs that the native-born labor force is unwilling to take. Also the most developed 20 countries which are the destination for over 2/3 of the total amount of immigrants rely on them of being a cheap and docile workforce. Therefore, immigrants are accepted to work in different developed countries so that they can "help them maintain their economic growth, help them through their economic expansion and by stopping the counterproductive job fluctuations." (Cojocaru, 2013, p.347)

Developed countries rely on immigrants to help them increase their revenues and internal production, but also benefit from all the positive aspects of the *brain drain-brain gain* process established above, thus relying on high qualified immigrant workforce which helps them achieve their goals.

Risks for the countries of destination

One of the main risks for the countries of destination is creating social problems, this being for example one of the main reasons of BREXIT. Although immigration did not create any extra unemployment, it was not the way British citizens perceived immigrants, in some cases British employers stating that they consider immigrants as being better prepared than their own citizens.

Not only UK struggled with social problems regarding immigrants. Other countries, such as France or Germany experience the same problems regarding: lack of shelter for immigrants, many of them living on the streets, lack of schools for immigrant children, lack of personnel in schools, rise of criminal rate, traffic accidents etc.

On a long term these problems will create imbalances due to the stability factor. Migrants will want to settle down with their families in the receiving countries, therefore one of the key positive attributes of immigrants, their mobility as workers, will disappear.

International migration governance

In governing the process of international migration, certain factors have emerged during time and offer now their assistance and guidance in this process: a) International

Organization for Migration (IOM); b) The International Labor Organization (ILO); c) United Nations High Commissioner for Refugees (UNHCR); d) The Human Rights Council (HRC).

Their role is to elaborate the regulatory framework that affects international migrants, and contribute to its applying in an efficient manner so that it can:

- establish competencies and obligations to receiving countries of migrants;
- identify in which particular areas certain states should convene to cooperate regarding international migrants;
- establishing rights and responsibilities for migrants.

Iancu (2013) argues that the future of these policies regarding migrants, can lead to an argued reasoning such as:

- economic growth fuels migration;
- international immigration is a consequence of the process of social, political and economic integration;
- qualified labor will not always relocate to the developed country;
- conditions on the labor market are not necessarily decisive in generating migration;

Conclusions

While some might argue that international migration does not determine the reduction of inequities, which would lead to balance, but rather intensifies them, sustaining underdevelopment, with the loss of the human capital, and, in essence, international migration of labor is the result of a complex set of individual actions and social structural changes, and its analysis involves taking into consideration certain interests of different actors which have a specific role in different environment, but mainly the actions of migrants which are "oriented into gaining as much resources as possible" (Goss& Lindquist, 1995; Son et al.,2009), the present article has to offer a rather more positive perception over international migration.

The economic justification for accepting migrating labor force in Europe is based on 3 arguments:

- 1) European governments tend to have a unified reaction into recognizing the importance of recognizing skills in generating productivity and economic growth. Human capital is thus a huge and vital factor into innovating and growth of productivity, and therefore creating new jobs. For example, "every high qualified immigrant who works in IT in Germany is capable of creating 2,5 new jobs" (Iancu, 2013, p.155)
- 2) although unemployment rate in Europe is at a high level, "European workers are still selective when it comes to choosing a job and are far more qualified than they were 2-3 decades ago" (Iancu, 2013, p.144)
- 3) the aging of European population implies a high level of inactive dependent population, and this burdens social security and welfare systems of European countries, which will make them even more expensive. Therefore, this will generate other models of consumption, especially when it comes to medical assistance, or outdoor activities, which will produce jobs and will need proper labor force provided by immigrants.

Besides the necessity of migrants in certain areas of the European economy, there has to be a careful and unified monitoring of the almost 1 million refugees who have entered the EU in the past 3 years. Proper action into integrating them into the European labor force without interfering into the European immigration process which produces

benefits for the eastern European countries which rely on their workers to provide them with money remittance is also imperative and needs to be a zero priority for the EU states.

Abstract. *Since de developments at the beginning of the war in Syria and the so called "Arab spring" it is important to understand what might be the consequences of such events. Cultural diversity must be now more than ever accepted, otherwise it might produce critical imbalances in the society. The following article aims to tackle the difficult questions regarding who, when or what might influence the process of migration, but also the main questions regarding whether religious radicalization is the source of the problems and how exactly it might be prevented? The research method starts from proving that human resource management often comes as a useful tool in overcoming cultural differences caused by migration, therefore it need to be used to address the main dilemmas regarding cultural differencing. At the same time, the origins and identity of migrants play an important part in understanding how challenges regarding particular migrants might be tackled. The idea is to establish that religion, culture and civilization developed in the original war-zone countries from the Middle East play a key role into the development of certain values, visions of life, beliefs and many more particular aspects that define migrants that come from those areas. In addition to that, key questions should be asked regarding the ways people interact with different cultures such as the Islamic ones in different territories. In the and it is to be recognized that there are at least five key actors that are currently involved into merging or/and accepting migrants, and each of their role need to be detailed so that human resource managers can have a clear path on how to address problems regarding migration from conflict zones. One of the future research questions that the article proposes is whether the failure of the western values in the Muslim conflict countries is a permanent one and will it lead to future permanent conflicts between migrants coming from those areas and Christians with western values.*

Keywords: *Arab spring; international migration; migration consequences; cultural diversity; islamization.*

Introduction

The failure of the West in the Middle East and Africa has left tens of millions of people without homes or a stable environment to live in. That is why over the director of the UN office in Geneva, has stated at the begging of spring 2017 that "between eight to ten million migrants are still on the way to Europe". This catastrophical chain of events will lead to the rejection of cultural differences separating the vast majority of Arab migrant

population and the rest of the population, which can have a terrible impact on both the global market but on society in general.

Therefore, we must ask ourselves how exactly do organizations manage to cope up with the hard challenge of dealing with globalization, and how exactly do cultural differences can be viewed from a managerial point of view.

Human resource management in overcoming cultural differences

“In a globally developed economy human resource management is confronted with the pressure of cutting costs, and using new technologies, but also with the challenge of standardizing processes where this is possible.” (Preda, 2006, p.17) Therefore, managing human resources must become more and more preoccupied with managing cultural differences, as a means of motivating their staff from different parts of the world. In most of the cases it all comes down to better financial rewards, but “there still are cultures where titles, staff bonding and social status can also be used into rewarding staff.” (Hoffman et al., 2016, p.24)

It has also been often accepted that people are generally relocated from a place to another because they can adapt to the culture from the receiving area, therefore multinational teams or multicultural teams might be even more productive with the proper feedback.

In another opinion, Adler (2010) argues that cultural hypotheses regarding cultural diversity and it's eco at a managerial level are viewed from two different perspectives:

- a) the hypothesis of homogeneity has a consequence the diminishing of the diversity level. Dominant cultural groups often start from the premises that every person is the same and they should act like it. This model imposes an inflexible leadership and it is typically used in traditional or conservative organizations.

- b) the hypothesis of ethnocentrism consists into some sort of recognition of diversity but in a problematic way chooses to minimize the cultural differences.

- c) the hypothesis of synergy is built upon the idea that diversity has its limits but at the same time has its worth, accepting different solutions into managing intercultural differences.

Fons Trompenaas (2009) has identified seven managerial dilemmas regarding the cultural differencing criteria:

- 1- universal or particular it refers to those certain exceptional situations that cannot be addressed after a specific of known rules. The expression of this dilemma can be exemplified with the following question – should problems be solved after the most relevant known rule or should they be solved by addressing their unique nature?

- 2- analyze or integrate – this dilemma can be reduced to the following question – does managerial efficiency consist into an analytical approach of events or the need to be addressed in a global manner?

- 3- individualism or communitarianism – this dilemma can be reduced to the following question - what is more important: concentrating on the individual development or concentrating on the development of the organization itself (as being part of a community of members that are obligated to serve its purpose)?

4- orientation inwards or outwards this dilemma can be reduced to the following question - what is more important: reasoning, decisions, inwards actions or influences, signals and outside tendencies?

5- time as a succession or as a sync factor - this dilemma can be reduced to the following question - "is it more efficient to leave things a certain succession or to try to unite the team efforts?" (Băileşteanu, 2008, p.121)

6- equality or hierarchy - this dilemma can be reduced to the following question - should employees be treated as equals in order for them to perform or should there be a clear specific of requirements that should be evaluated?

7- earned status or given status - this dilemma can be reduced to the following question - "does the employee status depend on work results, seniority, education, strategic positioning or potential?" (Hoffman et al., 2016, p.34)

Origins and identity of the human resources

The origin and identity of the people who adhere to certain sets of values, the vision of life, normative systems, beliefs, it only counts on the survival of these values, visions, systems, beliefs. White, black, yellow, or in any combination, people really become people beyond the horizons of lucky primates (a horizon that must also be presented in safety and dignity, being the biological basis of the human condition) through socialization, education, instruction, vision, memory, looking for a verticality that leads them above the animal condition, and so on.

Therefore, we can assume realistic and stoic physical (gradual and non-violent, hopefully) replacement of Europe's current population. But we must try to save what can be saved, if we think it deserves the effort, from everything that has imagined, dreamed, created our continent, enrolling us with modesty in a common patrimony of humanity, with the new Europeans, accepting our faults and mistakes, but not without pride of doing good deeds, in the spirit world as well as in the world of matter.

This is the great challenge of Europe's present and future. If we do not find the good answers not only to integrating Muslims peacefully they are tempted to get radicalized. Will for example the 2022 fictional Frenchmen (practically those we see today in reality) obey the Muslims' struggle? Extrapolating the anxieties and puzzles of our present (when Muslims try to get politically organized and why they don't do it sooner?), will for example the Islamist candidate defeat Marine Le Pen in elections, so that Islamic France formally respects the rules of democratic play and reduces to absurd isolation the politics of the National Front and the counterproductive fragmentation of parties and public opinion (for the time being, they collide in the second round)? These are just hypothetical scenarios but with a fundamental base regarding what might happen if the problem isn't addressed properly.

The echoes of violent confrontations sparkled in the Middle East and Africa, "islamization is based on corruption, opportunism, the abject speculation of conflicts between ambitious colleagues and, above all, an amazing fatalism." (Băileşteanu, 2008, p.123) This imposes a serious discussion about the spirituality / culture / civilization of the both the West, the Middle East, and the way people address to cultural differences.

The period of Islamic terrorism as inspiration for other regions of the world in which Islam is rising, has to be addressed in a different manner, otherwise "islamization" is

announced not only through isolated incidents, however frequent and bloody, but through a wider project in which spiritual / cultural / civilization elements are central. This paradigm of caliphate, preached by Islamic religions and hard to counteract or replaced by the politico-philosophical modernity of democracies, has a hot, spiritual / mystical core. The West must be able to respond to Islam in a peaceful and productive answers, although so far the international community have been of a completely different nature of actions regarding the Islamic zones of conflict such as: military responses (weak, hesitant, counterproductive), economic responses (symbolic sanctions, canceled by the need for resources, markets and labor), cops (more failures), cult attacks (caricatures, the obligation to accept any form of jokes, clothing restrictions) etc.

The majority of nowadays white Western youths are not that thirsty of faith (a profound human need of many, if not all Muslims, which cannot be replicated rationally), and this might become the source of conflicts among youth of different religions such as Islam. In a somehow opposition to the West, but this does not mean that Islam is the only spiritual / cultural / civilization problem of the West, religion strives as an important source of work conflict firstly. Nowadays we now have shifted our attention to what might happen in the future as radical Islamist gather in Libya and threaten with new attacks in Europe, as IS it's being shattered by the international coalition in Syria, questions remain regarding the fundamental fact of spiritual presence and offer. It is a challenge to the modern world to see how in a postmodern era we can still deal with such radical challenges of protecting the human race from self-destruction due to religious hate.

Buddhism, Jainism, Animism, Christianity (Catholic, Orthodox, Protestant, Neo-protestant) and others do not raise comparable issues to the radical ones that have sparkled from the Middle East. "Neither our Orthodoxy seems to me to be truly dangerous, although it is preoccupying and symptomatic, with many similarities and sufficient causes common to Islam." (Corboş & Popescu, 2013, p.55)

Therefore, if we tackle the cultural problems of migration, questions regarding their staying in the EU still emerge. That is why we should start asking questions regarding the ways people interact with different cultures such as Islam:

1. The non-Islamic workforce that is working currently in developing peaceful rich Arabic countries such as: the UAE, Saudi Arabia or Qatar.

Many non-Islamic people work in these 3 countries but the way they are treated is quite distinct. While people from Europe or The US are being seen as superior labor force, and are paid most of the time more that they normally would be in their home countries, people from all over south-east Asia are being highly underpaid and treated in a racist manner. Also, there is a big difference in what the Saudi Arabian society requires from the foreign workforce than for instance the UAE. "These differential treatments are already a first a huge cultural barrier in front of the religious acceptance of Islam by the West."

2. The non- Islamic workforce that is working in conflict zones

This labor force can be split into two different categories: the people that are part of the military forces trying to imply or maintain peace in the region, and secondly, the people that work together with international organizations to help aid the refugees and help create a stable environment that will prevent them to spread through Europe.

3. The refugees/migrants who have entered the EU from conflict zones, generally with Arab populations.

It is estimated that over 1,3 million people have entered the borders of the EU since 2011, entering a competition for resources with Europeans who work in different countries than their own and who have claimed that this is their right but also privilege for which their countries have sacrificed a lot of deal to obtain. This means that if the EU does not manage to stop any form of discrimination based on nation or religion, the EU will face (and it already does) a huge wave of nationalist vision spreading that will fuel the fear or radicalism among Muslims.

Key actors and their role into solving the crisis

There are key actors involved into the developing of relations between the two sides, relations that can either go one way (the peaceful one) or the other (the conflicting state) are:

1. International organizations and their leaders:
2. Politicians
3. Employers – Managers
4. Civil society
5. Religious key leaders

These actors have all the power into shifting the attention of the public and guide it to the right peaceful way. But the problem with that is that most of the actors above either have overstepped their authorities, either they have ignored them, or done too little too late. For instance:

- when it comes to the involvement of the **international organizations** (such as the UN, EU or NATO), most of their actions in the conflict areas were either too little or too late, which lead to the even more chaos in the areas.

- **politicians** – either we refer to the local ones or the ones abroad, have invested their personal ambitions into imposing their view as being the only ones right, acceptance or productive alliances being forgotten in this case.

- **managers** – especially the ones from the private sector in Europe are still reserved or dismissive regarding accepting or even hiring for that matter, migrants, especially Arab ones.

- **civil society** – has failed to convince even the general population in Europe to accept cultural diversity, which lead to cases like Denmark, Germany, Austria etc. where ultranationalist politics grew in success especially among youth. If the actions of civil society are such ineffective on home ground, their effectiveness abroad in convincing people to leave their cultural differences aside is even more inefficient.

- **religious key factors** – unlike the first four categories of actors involved, which were unsuccessful in their actions, religious leaders have emerged themselves into politics, exceeding their attributions and promoting violence and the total rejection of the West, bringing nightmares and shadows of the Iranian Revolution over much part of the Arab

world, especially after the Arab spring in 2011. The West is useful as long as it finances their war against all those who refuse to accept religious interference into politics.

Conclusion

Therefore, the failure of the western values in the Muslim conflict countries has its origins into the failure of the first 4 key actors to promote cultural acceptance in a peaceful manner. Their failure ultimately leads to the success of the religious radical figures, that have managed to shade the importance of politicians and for politics for that manner, making the debate in the society about the level of religious non-acceptance that needs to be more and more increased. This makes radicalization more and more easy, and it also means that the only solution to this crisis is a coordinated effort from all 4 key decision making factors, with huge costs, to counter the power of religion, but only through peaceful actions.

PAY SATISFACTION AS MEDIATOR OF THE INFLUENCE OF ORGANIZATIONAL JUSTICE ON WORK MOTIVATION: AN INVESTIGATION IN THE ROMANIAN CONTEXT

Sebastian URIEȘI

Alexandru I. Cuza University of Iasi
11 Carol I Blvd., Iași, Romania
sebastur72@gmail.com

Abstract. *The financial rewards received by employees have long been considered as a powerful work incentive, but previous studies showed that the relationship between pay and work performance is not necessarily linear. Our study focuses on a specific subjective determinant of work motivation related to pay, namely on pay satisfaction, and on its potential factors in the area of organizational justice. Past investigations found that employee's subjective reactions towards their pay (i.e. their pay satisfaction) are grounded in their perceptions of the fairness of pay distribution and decisions, i.e. of the ways in which financial rewards are allocated within the company. We took into account two dimensions of organizational justice that have been shown as for being especially relevant for employee satisfaction and motivation, i.e. distributive and procedural justice. Our hypothesis was that pay satisfaction mediates the influence of distributive and procedural justice on work motivation. The study was conducted on a sample of 270 Romanian employees of companies in various sectors located in Iasi who were administered the research instruments measuring the four variables in our model. The model, comprised of the pattern of relationships between variables, was tested through structural equation modeling. Our results show that distributive and procedural justice perceptions have a positive influence on pay satisfaction, which further exerts a positive effect on work motivation. Overall, these two relationships indicate that pay satisfaction is a mediator of the influence of the two dimensions of organizational justice on work motivation. A direct effect of procedural justice on the latter variable was also highlighted by the results of the data analysis and was included in the general model. Further studies should test the role of other objective and subjective dimensions in this pattern of relationships, as well as examine the effect of interventions designed to improve employees' perceptions of organizational justice.*

Keywords: *work motivation; pay satisfaction; distributive justice; procedural justice; work performance; mediation*

Introduction

The high competitiveness of the economies worldwide force companies to design and implement human resources policies that would increase the work performance of their staff, which would consequently foster the performance of the company as a whole. Hence, personnel motivation to perform in their organizational tasks and duties represents an essential condition for the companies' economic growth and even survival. The importance of personnel work motivation for work productivity and positive organizational behaviors has been attested by numerous field studies (Schultz & Schultz, 1998; Huddleston & Good, 1999). Not only highly motivated employees perform better at work than their less motivated colleagues, but low work motivation

can also become a toxic employee characteristic, generating negative effects on relationships with management and on the general work atmosphere of the organization (Marsden & Richardson, 1994).

One of the traditional instruments through which companies aim to increase employee motivation is that of financial rewards and incentives. Pay has long been considered as a powerful work incentive, due to its high personal valence that can motivate employees to obtain higher performances on the job in order to receive such rewards, in line with the classic expectancy theory (Vroom, 1964). According to Vroom's Valence - Instrumentality - Expectancy Model, work motivation is determined by the relationships between the effort employees put into their work, the performances that they achieve and the subsequent rewards they receive. Consequently, in order to generate high levels of motivation in their personnel, organizations should ensure that work efforts would indeed lead to performance on the job (Expectancy), that these performances would be rewarded (Instrumentality) and that the rewards allocated are valuable for the employees (Valence).

Pay is a universal incentive, and the influential role of financial rewards on organizational behaviors has been documented by various studies, which highlighted associations between pay and productivity (e.g. Lum et al., 1998), but also other important areas such as personnel turnover (Thatcher et al., 2006; Hunter, Tan & Tan, 2008). Nevertheless, there are also cases in which the relationships between pay and work performance is not so straightforward, as it can be illustrated by two lines of research, specifically that focused on the effects of pay dispersion and that concerned with the effects of pay for performance programs. Firstly, there are empirical results showing a positive influence on pay dispersion and employee performance, in the sense that performances in companies allowing a dispersed pay system, in which there are considerable differences in financial rewards between employees even at the same organizational level, are higher than those in companies with compressed pay systems (Downes & Choi, 2014; Kepes, Delery, & Gupta (2009). Conversely, other studies highlight an inverse relationship between pay dispersion and work performance, indicating detrimental effects of large differences in pay among employees (Pfeffer & Langton, 1993; Bloom & Michel, 2002). Similarly, positive effects of pay for performance programs, in which a significant part of the employees' total retribution is associated with their work performance, have been frequently reported (e.g. Heneman, Ledford, & Gresham, 2000), as well as negative consequences on job behaviors and even overall performance (Wright et al., 1993; Beer & Cannon, 2004).

Such contradictory findings can be accommodated and understood by taking into account not only the objective side of the organizational phenomena at stake, such as financial compensation, pay dispersion and variations, but also the subjective side, in terms of employee's relevant attitudes and evaluations that, in turn, influence their work motivation. Our study focuses on a specific subjective determinant of work motivation related to pay, namely on pay satisfaction, and on its potential factors in the area of organizational justice.

Firstly, it is important to note that the effects of financial rewards on work motivation and performance are mediated by the subjective dimension of pay satisfaction. In other terms, it is the influence of pay-related variables on pay satisfaction that further generates effects on work behaviors. Pay satisfaction represents the employee's

personal evaluation of the financial rewards received, and this evaluation compares the actual level of pay to that considered as ideal in the respective organizational context (Kwon et al. 2008). Besides representing a major component of the general satisfaction employees have with their job (Jurgensen, 1978; Rusbult & Farrell, 1983), alongside other facets such as intrinsic attractiveness of the work tasks, supervision, work relationships etc. (Cotton & Tuttle, 1986), it also has important effects on work motivation and subsequent performance (Dailey & Kirk, 1992).

Secondly, previous research in the organizational psychology literature suggests that the subjective evaluation of pay is based, among others, on employees' perceptions of the organizational procedures involved in the allocation of these financial rewards (DeConick & Stilwell, 2004; Sweeney, 1990). The general principle according to which pay levels and dispersion are evaluated by employees is that of fairness, and previous results show that the perceived fairness of pay can be even more important in terms of its organizational consequences than the actual objective amounts of pay (Folger & Konovsky, 1989). The more general organizational psychology concept that corresponds to and accommodates these subjective perceptions of fairness is organizational justice.

Generally, organizational justice refers to the fairness of the decisions made within an organization, as they are perceived by its employees (Greenberg, 1987). Its theoretical origin is equity theory (Adams, 1965), which highlighted the importance of employee perceptions of fairness, especially regarding the allocation of financial resources within the company, for their organizational behaviors, unfair pay distributions leading to negative consequences on work motivation and productivity. According to the equity theory, an employee's work motivation depends on the comparison that he/she makes between his/her ratio of inputs and outputs and the correspondent ratios of his/her fellow employees. Inputs represent the contributions that one makes to the progress and success of the company, such as effort, skills, experience etc., while outputs refer to the benefits one receives from the organization, such as salary, promotions, bonuses etc. When employees perceive in-equitability at their expense, for instance when they notice that other employees receive more rewards for the same overall amount of input, or when the rewards are the same among employees while some are putting much more effort in their work than others, they will try to reduce the inequity. In many cases, this entails diminishing one's input, by reducing one's effort and productivity. Thus, perceived inequity can have direct and detrimental effects on work motivation.

The dimensions of organizational justice that are most relevant for the topic of pay allocation within companies are distributive and procedural justice. Distributive justice refers to the evaluations of the outcomes of the financial decisions concerning an employee, in other words to the degree to which employees perceive their pay as equitable in comparison to that received by other colleagues. Procedural justice refers to the fairness evaluations of the organizational procedures, methods, and criteria used to decide these financial outcomes (Roth, 2006). These two dimensions of organizational justice have been found to influence various aspects of employee reactions and behaviors, such as organizational identification (Kwon et al., 2008), work withdrawal behaviors (Pinder, 2008), the tendency to engage in counterproductive behaviors and workplace conflicts (Cohen-Charash & Spector, 2001), turnover intentions (Lum et al., 1998). Moreover, employees perceiving pay decisions and

procedures in their company as unjust have lower pay satisfaction (DeConick & Stilwell, 2004) and work performance (Colquitt et al., 2001).

The present study aims to test these relationships between distributive and procedural justice, pay satisfaction and work performance in a different cultural setting than the Western one in which the studies in this area have been mostly carried out, namely the Romanian one. As mentioned before, the empirical results concerning the motivational and work performance effects of various pay – related factors (such as pay dispersion or pay for performance programs) have been mixed, highlighting the need for further studies in this area in various socio-economic spaces. The research reviewed above suggests that employee's subjective reactions towards their pay (i.e. their pay satisfaction) are grounded in their perceptions of the fairness of the ways in which financial rewards are decided and allocated within the company. When they evaluate the amount of pay they receive as unjust, by comparing their work input (effort, qualifications, time etc.) and pay to the input and rewards received by their colleagues and assessing this ratio as unequal at their expense, and / or when they perceive the criteria upon which pay is distributed in the organization as unfair, their pay satisfaction is affected beyond the influence that the actual objective level of financial rewards might have. Furthermore, this detrimental effect of organizational injustice on pay satisfaction affects employee work motivation. Consequently, we hypothesize that pay satisfaction mediates the influence of distributive and procedural justice on work motivation.

Method

Participants and procedure

We distributed 395 surveys to employees in 15 companies located in Iasi, Romania, out of which 270 were returned. The surveys were anonymous, and confidentiality was ensured. In the final sample, 140 employees (52%) were men; mean age was 27 years. Participants' distribution on the work sector criterion was: 81 (30%) in the banking sector, 65 (24.1%) in the health sector, 42 (15.6%) in the industrial sector, 42 (15.6%) in the sales sector, 25 (9.3%) in the private school sector and 15 (5.6%) in private consulting.

Instruments

Work motivation was assessed using the scale developed by Patchen (1970) and used in various studies on the factors and consequences of work motivation (e.g. Khojasteh, 1993; Crewson, 1997). The three items of the instrument require participants to evaluate their level of agreement with sentences describing the work effort that they usually invest. Higher overall scores indicate higher levels of work motivation.

Pay satisfaction was measured with the 13-item instrument developed by Heneman & Schwab (1985). Its items refer to four facets of pay satisfaction, namely pay level, pay raises, benefits, and structure and administration of financial rewards. Participants rate their level of satisfaction concerning the various dimensions of their pay by choosing an option from 1 – “not at all satisfied” to 6 = “completely satisfied”. Higher overall scores indicate high pay satisfaction.

Distributive justice was assessed with the 7-item instrument developed by Brashear, Brooks, and Boles (2004), which has been used in other organizational psychology studies (Chan & Jepsen, 2011; Ladebo et. al, 2005). The scale measures employee perceptions of the distribution of the financial rewards in their company when taking into account their various organizational inputs (effort, responsibilities, quality of work output, etc.). Higher overall scores indicate perceptions of adequate distributive justice. *Procedural justice* was assessed with the scale developed by Tekleab, Bartol, and Liu (2005), a 2-item instrument requiring employees to evaluate the correctness of the procedures through which their financial rewards are determined, on a response scale ranging from 1 – “not at all correct” to 6 = “absolutely correct”. Higher overall scores indicate high perceived procedural justice.

Data analysis

Firstly, we assessed the internal consistency of our research instruments through their mean inter-item correlations, computed in SPSS 20.0 (see Table 1). Secondly, we computed the Pearson correlations between variables (see Table 1). Thirdly, we assessed the adequacy of the proposed causal model between the four variables of the research design, through structural equation modeling in AMOS 18.0. This approach allows the estimation of the statistical adequacy of a complex model, through several indexes (Byrne, 2001), as well as the changes in the relationships included in the model that would improve its adequacy, (i.e., Modification Indexes). In order to evaluate the goodness-of-fit of the model, we used the following indexes: the chi-square statistic, the Goodness of Fit Index (GFI), the Comparative Fit Index (CFI), the adjusted goodness-of-fit statistic (AGFI) and the Root Mean Square Error of Approximation (RMSEA).

Results

The inter-item correlations, presented in Table 1, indicate that all instruments have satisfactory internal consistency. The correlations are in line with our general hypothesis, with work motivation significantly and positively related to distributive justice, procedural justice and pay satisfaction, and the latter also positively associated to the two dimensions of organizational justice.

Table 1. Means, standard deviations, internal consistency and Pearson correlations between variables

	Mean inter-item correlation	1	2	3	4
1. Work motivation	.36	1.0	.33**	.06	.17**
2. Pay satisfaction	.33		1.0	.38**	.16*
3. Distributive justice	.40			1.0	.10
4. Procedural justice	.36				1.0

* $p < .05$; ** $p < .01$

Next, we used the structural equation approach to assess whether the hypothesized model of relationships between these variables, which includes causal effects on distributive and procedural justice on pay satisfaction, as well as of the latter on work motivation, has an adequate fit to the data.

The indexes of model fit resulted from the analysis of this model were: $\chi^2_3 = 8.61$, $p < .05$; CFI = .93, AGFI = .95, GFI = .98; RMSEA = .08 (with a 90% confidence interval .02 – .153). According to the guidelines concerning the accepted values and intervals of these fit indexes (Byrne, 2001), they suggest an acceptable level of model fit. We analyzed the modification indexes to identify the changes in the hypothesized model that could increase its statistical adequacy. We found that model fit can be improved by adding a causal relationship from procedural justice to work motivation, besides the effect of procedural justice that is mediated by pay satisfaction. We re-specified the model by adding this relationship and re-analyzed its model fit. The indexes resulted were: $\chi^2_2 = 4.34$, $p = .11 > .05$; CFI = .97, AGFI = .96, GFI = .99; RMSEA = .066 (with a 90% confidence interval .00 – .15). They indicate a better fit of this model, all indexes showing an adequate fit to the data, while there are no additional modifications that would increase model fit. Also, all the regression weights between variables were significant at the .05 level. The final model with the standardized regression weights, indicating the strength of the influences between variables, is presented in Figure 1.

Figure 1. The standardized regression weights of the effects in the final model
**** $p < 0.001$; * $p < 0.05$**

As the relationships depicted in Figure 1 show, we found distributive and procedural justice to exert significant influences on pay satisfaction, and the latter to have a positive and significant effect on work motivation. Hence, pay satisfaction emerged, as hypothesized, as a mediator of the effects of the two dimensions of organizational justice on work motivation. Moreover, procedural justice also has a significant direct positive influence on work motivation.

Discussion

Financial compensation has always been regarded as a major motivator of work motivation. Nevertheless, there are also conditions in which employee perceptions concerning the allocation of pay within their company generate detrimental effects on their motivation and subsequent performance, as studies on the consequences of pay dispersion and pay for performance programs have revealed (e.g. Bloom & Michel, 2002; Beer & Cannon, 2004). This indicates that the exact conditions in which pay – related variables and parameters lead to the best results in terms of work motivation and performance have yet to be determined, as well as tested in various cultural and socio-economic areas. Moreover, elucidating this issue could prove of considerable importance for the Human Resources professionals, as it could inform strategies aimed at increasing the work motivation of the personnel in their organization as well as at

counteracting the potentially detrimental influences on work performance of the employee perceptions concerning their pay.

Our study focused on the potential influential role of pay satisfaction and on the determinants of this evaluation from the area of organizational justice in a sample of Romanian employees. Our results indicate that the two dimensions of justice – distributive and procedural – have a positive influence on work motivation and that this effect is mediated by pay satisfaction. Thus, positive employee perceptions of distributive and procedural justice increase pay satisfaction, which further generates a significant positive influence on work motivation. Conversely, and in line with previous studies, employees evaluate the distribution of financial rewards in their organization as unjust are consequently less satisfied with their own pay (Aquino, Griffeth, Allen, & Hom, 1997). Similarly, when employees perceive the criteria, rules and procedures that make up the process of allocating financial rewards in their company as unjust, they become less satisfied with the pay that they regularly receive (Tang & Sarfield-Baldwin, 1996).

These influences of the two dimensions of organizational justice highlight its importance for the company, especially since they extend to other facets of employees' attitudes and behaviors, as other investigations have found. Specifically, employees who perceive low levels of distributive and procedural justice in their company also have a higher rate of turnover (Paré & Tremblay, 2007) and lower organizational commitment (Ahuja et al., 2007). Taking into account the influences on pay satisfaction and consequent work motivation highlighted by our study, organizational justice appears as a very important and sensitive facet of employees' perceptions of their company, and management representatives should invest effort into ensuring optimal levels of these perceptions among their staff. Consequently, the findings of the present study could be incorporated and developed in HR strategies that would aim to ensure transparency towards employees in what regards their pay and general rewards in all their components, specifically the bonuses, raises and other financial and non-financial benefits that they and their colleagues receive. This can be achieved by explaining the rationale and the exact mechanisms behind financial compensation decisions, which would diminish employee suspicions concerning unfair pay allocation or the interference of subjective biases in these decisions. Specifically, HR professionals could encourage management to organize meetings in which these issues would be openly discussed with the employees, and in which the conditions under which an employee can receive the maximum amount of payment under the current organizational pay scheme would be clearly described. This would not only clarify the relationship between effort and financial rewards for each employee, leading to higher work motivation but would also alleviate suspicions that these rewards would be subjectively and arbitrarily allocated.

Moreover, implementing criteria that employees perceive as being a fair ground for the pay differences between staff is another potentially fruitful intervention. Past work performance is one of the criteria that is perceived by employees as having the higher degree of legitimization (Shaw & Gupta, 2007). Thus, implementing or stressing the weight of this factor in the compensation policy implemented by the company increases the probability that the procedures and the results of this policy would be perceived as fair by the staff. This would also lead to positive effects on general productivity; as Shaw, Gupta, and Delery (2002) found, in companies using performance as the main criterion in the allocation of financial rewards, large differences in pay increase work

performances, while the opposite effect was found in the organizations in which employees' compensation is not differentiated according to work performance. Consequently, our results suggest that another beneficial HR strategy in terms of work performance would be to recommend the implementation of pay for performance programs and to assist management in their development.

Our results also pinpoint a significant effect of pay satisfaction on work motivation, the former mediating the influence of distributive and procedural justice on the latter dimension. In line with previous investigations (e.g. Dailey & Kirk, 1992), employees who have positive evaluations of their current financial rewards are more motivated to perform in their work. Finally, we also found a direct effect of procedural justice on work motivation, indicating that perceiving the criteria and process of allocating financial rewards in their company as unjust has a direct detrimental effect on one's motivation. Similar distinct route of the influence of the two dimensions of organizational justice has been highlighted by previous studies; for instance, Tekleab et al. (2005) found procedural justice to have a stronger association to the satisfaction employees have towards their recent pay raises than to the actual amount of pay they receive. Our result highlighting the specific effect of procedural justice further stresses the influence of this dimension on the general subjective relationships on an employee with their company and thus the importance for the latter of eliminating any suspicions of unfairness in its procedures.

One of the limitations of the present study is that we used a correlational research design, which cannot fully demonstrate the presumed causal relationships between the variables in our model. Second, all data was collected at a single point in time, and thus our design does not capture the possible variations in motivation in time that might be generated by variations in the economic conditions of the companies in our sample.

To conclude, our study conducted on a sample of Romanian employees found distributive and procedural justice perceptions to have a positive influence on pay satisfaction, which further exerts a positive effect on work motivation, indicating that pay satisfaction is a mediator of the influence of the two dimensions of organizational justice on motivation. A direct effect of procedural justice on the latter variable also emerged. Further studies should test the role of other objective and subjective dimensions in this pattern of relationships, as well as examine the effect of interventions designed to improve employees' perceptions of organizational justice.

KNOWLEDGE ECONOMY

UNIVERSITIES AS LEARNING ORGANIZATIONS: CHALLENGES AND STRATEGIES

Constantin BRĂȚIANU

Bucharest University of Economic Studies
6 Piata Romana, Sector 1, Bucharest, Romania
constantin.bratianu@gmail.com

Abstract: *The purpose of this paper is to demonstrate that universities can increase their competitiveness and their ranking positions in this turbulent economic environment by transforming into learning organizations. Although universities have been created as places dedicated to teaching and learning, they are not learning organization by default. There is a widespread confusion between the process of individual learning, which is specific for students learning, and organizational learning, which is an organizational process developing at the university level. A university can become a learning organization if and only if its leadership creates strategies for transforming local and spontaneous organizational learning into a generic and organization-wide process based on clearly defined strategies. The university governance should become a strategic driving force and knowledge management should replace the traditional administration management. Universities in the knowledge economy need to create and disseminate new knowledge and to contribute through research and innovation to the community development. Thus, the vision and mission of the university should incorporate new attributes and the academic leadership should be able to implement all of these changes in the operational academic management. The methodology used in this paper is based on literature review and a conceptual analysis concerning the challenges of the university for the 21st century. The results show that universities can become learning organizations if and only if their leadership create a set of specific conditions and all the members of the academic community share the new vision and mission developed by the university leaders.*

Keywords: *university leadership, organizational learning, learning organization, knowledge management, intellectual capital*

Introduction

Universities of the 21st century face new challenges from the knowledge economy and must perform in a fierce global competition (Bratianu & Pinzaru, 2015; Duderstadt, 2000; Hadad, 2017; Prelipcean & Bejinaru, 2016; Shattock, 2006). The ranking systems of the world universities generate new pressures for performance and offering best undergraduate and graduate study programs. In the same time, universities face a strong competition for intellectual and financial resources. They have to adapt their vision and mission to the new requirements for knowledge generation and innovation, and transferring intellectual property toward society (Dima, 2014; Sanchez et al., 2009; Secundo et al., 2010; Shattock, 2013; Vătămănescu et al., 2015).

The *learning organization* is a metaphor which has been extensively used especially after the widely acclaimed book *The fifth discipline: The art & practice of the learning organization* published by Peter Senge in 1990. In this book, Senge considers the *learning organization* a social invention. While engineering inventions are composed of

tangible components, social inventions are composed of intangible components called *disciplines*. A discipline is essentially “a body of theory and technique that must be studied and mastered to be put into practice” (Senge, 1999, pp.10-11). An organization can become a learning organization if and only if its leadership develop and implement adequate strategies for stimulating and amplifying organizational learning (Argote, 2013; Garratt, 2001; Örténblad, 2011; Starbuck & Hedberg, 2003).

Successful universities, which are world-class universities (Bejinaru & Prelipcean, 2017) made great transformations in becoming *learning organizations* by developing new dynamic capabilities (Teece, 2009) and a strategic governance (Mok, 2008; Mora, 2001). The purpose of this paper is to show what are the necessary requirements for a university to become a learning organization, and how to develop knowledge strategies for increasing its intellectual capital and competitiveness in the turbulent environment of this century. The structure of the paper is as follows: after this brief introduction, we present the basic features of the learning organization, then we consider university governance and leadership as the driving forces for its transformation into a learning organization. We close the paper with some final remarks and further research to be done.

Organizational learning

Organizational learning is a metaphor since only people have the natural ability of knowledge processing and learning. As Argyris remarks (1999, p.7), “When we begin by assuming that individuals are the only proper subjects of learning and that individuals learn, then we are likely to be puzzled and disturbed by the notion that learning may also be attributed to organizations”. Organizational learning is a process of transferring knowledge from individuals to a social structure which is able of developing a specific memory and specific routines in its collective behavior. It is a learning process through social interactions. Through organizational learning “whole organizations or their components adapt to changing environments by generating and selectively adopting organizational routines” (Argyris, 1999, p. 8). Crossan et al. (1999, p. 523) define four premises for an effective organizational learning:

- Organizational learning assumes a tension between knowledge exploitation and knowledge exploration.
- Organizational learning is a multilevel process (i.e. individual, group, organization).
- The three levels of organizational learning are linked through psychological and social processes: intuiting, interpreting, integrating, and institutionalizing (4I's).
- Cognition influences action, and action influences cognition.

Following this organizational learning model, we can see that there is a feedback direction and a feedforward one. The feedforward reflects knowledge exploration, and it promotes learning from individuals and groups to organizations, where new knowledge will be integrated into routines, procedures and strategies. Feedback reflects knowledge exploitation and institutionalizes the learning results.

Intuiting is a dominant unconscious process which is based on pattern recognition and analogy. When time or complexity of the new problem become constraints, the cognitive unconscious tries to find a solution by simplifying the context and finding similar patterns for a possible solution. Intuiting is a fast process but the probability of error is high, especially for people who are beginners in a certain domain. Intuiting works

well for experts, who accumulated thousands of hours of experience in a specific domain of activity (Gladwell, 2005, 2008; Kahneman, 2011). Intuiting is based on processing emotional information and knowledge (Bratianu & Orzea, 2013; Hill, 2008). *Interpreting* operates at the interface between individual and group levels. It is the sequence of externalization of that intuition and explaining it through combination to others (Nonaka & Takeuchi, 1995). Interpreting is a social process when sharing knowledge and values leads to group learning (Bratianu & Orzea, 2010a). *Integrating* is a social process which operates at the group level and at the interface between groups. Integrating is an essential process in transforming the potential of the intellectual capital into operational intellectual capital, and in initializing action through decision making (Bratianu, 2018; Bratianu et al., 2011). *Institutionalizing* operates at the organization level through new routines. Organizational learning is completely different than the individual learning, since the outcomes belong now to the whole organization: "Although individuals may come and go, what they have learned as individuals or in groups does not necessarily leave with them. Some learning is embedded in the systems, structures, strategy, routines, prescribed practices of the organization, and investments in information systems and infrastructure" (Crossan et al., 1999, p.529). Although these phases have been presented in a sequential way, they may manifest simultaneously since organizational learning is a complex and nonlinear process (Bratianu, 2013; Bratianu & Vasilache, 2010).

Learning organizations

As mentioned before, *the learning organization* is a metaphor created to define the organization where managers create strategies to extend organizational learning throughout the company. Örtenblad (2001, p. 126) makes a clear distinction between the process of organizational learning and the learning organization "Organizational learning means processes or activities (of learning) in the organization, while the learning organization is a form of organization in itself". Organizational learning may happen locally in any organization, but only few of them can become learning organizations if they develop and practice the five disciplines defined by Senge (1999): personal mastery, mental models, shared vision, team learning, and systems thinking. Personal mastery stimulates personal motivation to never stop learning and improving the professional competences. Mental models focus on the capacity of creating some simplified cognitive models of the real world which help managers in understanding the business environment and in making decisions. The better the cognitive approximations are the deeper understanding managers get for solving practical problems. Shared vision means to focus on the future of the organization and on designing business strategies to achieve competitive advantage (Bratianu, 2017a, b). Finally, the system thinking integrates all the other four disciplines and creates the framework for the learning organization (Gharajedaghi, 2006; Senge, 1999). Systems thinking is related also to the concepts of emergence and self-organization. *Emergence* refers to the capacity of the whole to generate new properties which cannot be found at the level of any components. When there is an emergence of a stable dynamic structure, the new phenomenon is called self-organization (Sherwood, 2002, p.15).

Garvin (2000, p.11) defines a learning organization as being "an organization skilled at creating, acquiring, interpreting, transferring, and retaining knowledge, and at purposefully modifying its behavior to reflect new knowledge and insights". Thus, one of the main features of the learning organization comes from its capacity to create new

knowledge and learn to adapt to new and complex situations. Senge (1999) makes the distinction between adaptive learning and generative learning. *Adaptive learning* is based on a process of extrapolation of the present into the future by small changes designed on a short-term perspective and predictable results. *Generative learning* is based on interpolation of the future and designing complex changes on a long-term perspective. While adaptive learning makes use of knowledge exploitation, generative learning makes use of knowledge exploration.

Garvin et al. (2008) developed an assessment tool for learning organizations able to measure the depth of organizational learning. This metric is based on the assumption that there are three basic building block of the learning organization: a supportive learning environment, concrete learning processes and practices, and leadership that reinforce learning. *A supportive learning environment* is a necessary condition for creating a climate of psychological safety. That will allow managers and employees to learn from both their successes and mistakes. Also, they will be more creative since there is no fear of being penalized for eventual errors in their decisions and actions. A supportive learning environment creates an open space for new ideas and stimulates people for reflection and collective decision-making. The second block refers to *concrete learning processes and practices*. Learning implies knowledge processing and testing new ideas, which finally lead to a better understanding of a given context and to a change in the organizational behavior. Learning can be stimulated by knowledge sharing which contributes to a higher average level of organizational knowledge as a result of a re-distribution of knowledge. A specific role is played by intergenerational learning which can be very successful in the generation-layered organizations (Bratianu & Orzea, 2012; Lefter et al., 2011). The third block refers to *the leadership that reinforces learning*. Transforming an organization where organizational learning may happen occasionally and locally into a learning organization needs a transformational leadership capable of integrating all necessary resources and local organizational learning processes based on a well-defined vision and mission. Transformational leadership (Bass & Riggio, 2006; Bratianu & Anagnoste, 2011) is based on strategic thinking and change management. It challenges all employees to find solutions for a better organization with a dynamic culture (Ghinea & Bratianu, 2012) and an intelligent approach to competition and performance.

Universities as learning organizations

Universities are knowledge-intensive organizations with natural organizational learning processes but many of them have no shared vision for becoming learning organizations (Bratianu, 2009, 2014). The structure of any university contains departments and schools for the academic part and different offices for the administration part. In each department or office people may share their knowledge and contribute to organizational learning, but if there are no strategies at the university level to stimulate and develop organizational learning then the university cannot transform itself into a learning organization. In other words, a university may become a learning organization if and only if there are fulfilled the following concomitant conditions: the existence of a supportive learning environment, the existence of concrete learning processes, and a learning leadership able to produce change and transform the organization (see Figure 1).

Figure 1. The necessary conditions for a university to become a learning organization
(Source: Author contribution)

Learning environment

Although Garvin et al. (2000) refer to the internal organizational environment, we emphasize the importance of the external environment as well, especially for the state universities in Europe (Bratianu et al., 2016; Christopher, 2012). Legislation and culture constitute powerful driving forces in shaping the organizational behavior and in any managerial decisions. Since most of the European universities are state universities, their governance doesn't have a full autonomy, which creates a rather significant dependence on the governmental financing system. In turn, this dependence induces some limitations in the academic management decisional process. For instance, if the financial system provides payments based on a yearly metric, a university is not able to sign contracts for a larger period of time even if that contracts may have a beneficial outcome for the university. Thus, creating real university autonomy is an integral part of the supportive external environment (Bratianu et al., 2016; Curaj et al., 2012).

The internal learning environment can be achieved through a dynamic organizational culture which integrates a motivational system able to stimulate organizational learning and a visionary leadership able to challenge the unpredictable future and solve the stupidity paradox (Alvesson & Spicer, 2016; Song & Lee, 2014). "Organizational culture is a compass that gives people direction, but it is also a prison that limits their freedom. Culture guides and integrates, but also blind and stifles thinking" (Alvesson & Spicer, 2016, p.193). Organizational learning is a process that requires both an individual and a managerial effort. If people don't have a clear target and a powerful motivational system these efforts will not be done, and there will be no supportive learning environment. It is not only about the capacity to learn, but it is also about the willingness to make all necessary efforts to learn and the set of values integrated into the organizational culture. Sometimes the shared beliefs may become a shared blindness.

Learning processes

In any organization, we have two types of learning processes: learning how to perform professional activities and learning how to use the power of social groups and of the whole organization to improve its performances. Unlike organizations focused on industrial production, universities are focused on learning processes. The final

outcomes of the “production process” consist of thinking models and skills students will be using in their professional life. The turbulent economic environment we face today requests to focus more on developing generic thinking skills than on transferring knowledge, although for many students that requires a mind-shift (Bereiter, 2002; Bratianu & Vatamanescu, 2017).

On the other hand, organizational learning implies knowledge creation, knowledge sharing, knowledge transfer, knowledge retention and a good balance of the organizational knowledge dynamics (Bratianu & Bejinaru, 2016; Bratianu & Orzea, 2010b). Since universities are age-layered organizations an important role in developing learning processes is played by intergenerational learning (Bratianu et al., 2011). As a result of intergenerational learning, universities can increase the knowledge retention when professors retire and take with them a huge expertise. Otherwise, the knowledge loss may put the whole university to risk when the number of retired professors is significant. That was the case of the Romanian universities in 2011 and 2012 when as a result of the new educational legislation have been forced to retire over 1000 professors. Many research programs and doctoral schools suffered an unpredictable knowledge loss.

Learning leadership

Leadership is the most important nonlinear integrator in any organizations which contributes directly to transform the intellectual capital potential into the operational intellectual capital (Bass & Riggio, 2006; Bratianu, 2011). Learning leadership is a dynamic capability of the university governance which contributes to achieving competitive advantage in the global competition (Donina et al., 2015; Teece, 2009). University leadership is responsible for developing the knowledge strategies for the university future and for transforming efficiently the potential intellectual capital into the operational intellectual capital (Bolisani & Bratianu, 2017; Bratianu & Bejinaru, 2017).

Conclusions

Universities are knowledge-intensive organizations whose mission is to create and transfer knowledge toward students and society. In the present turbulent environment, universities face a fierce global competition for human and financial resources, as well as for high technologies to shape the future.

The paradox of any university is that although it focuses on learning processes in developing students’ skills and minds, it is not by default a learning organization. In order to become a learning organization, a university needs to dispose of a supportive learning environment, to create organizational learning processes and to have a learning leadership. These are also the challenges for any university to become a world-class university, which means a university prepared for the global competition.

Abstract. *There is an increasing 'knowledge' component to economic activity. In a narrow sense this encompasses the growth of knowledge-intensive industries such as information technology, telecommunications and biotechnology. However, it is also becoming increasingly important in many other 'traditional' industries and there are indications that the knowledge content of work generally is increasing. The relevance of research is in the contribution of domestic economic science to building market relations, the sustainable and balanced development of the national economy in the face of global economic challenges, as well as the development of new scientific directions, concepts and models that are adequate to world trends and determine the construction of a "knowledge economy". The main idea of this research is to analyze the existing literature on research in the field of formation and development of a knowledge-based economy. In this paper, we examined in detail the existing literature related to the direction and depth of the development of a knowledge-based economy, indicating the most influential scientists, journals and relevant publications according to the most well-known Web of Science database. As the study of literary sources on the problems of the development of a knowledge-based economy shows, there is still no unequivocal opinion among researchers about its parameters and the depth of research. There are gaps that can be identified by analyzing existing literature. Knowledge economy is not just a new theoretical concept, but a new epoch, which has a fundamental difference from the era of the agrarian and industrial economy. Although its offensive appeared only in the early 90s, it already had an impact and caused changes in all spheres of economic and social life, and this influence is constantly growing. The trend of development of a Knowledge economy is the formation of a Knowledge economy, which will mean the onset of a new stage in the development of the global economy, namely, the stage of global economic networks. For Practitioners, this is valuable in that it is possible to determine the existing practice in the study of problems of development and development of a knowledge-based economy, as well as positive experience for the leaders of knowledge-based companies.*

Keywords: *knowledge-based economy, dimensions of knowledge-based economy, innovation management, literature review.*

Introduction

With the advent of the 21st century, information, communications, and computer technologies have undergone rapid innovation and popularization, profoundly altering human lifestyles and economic structures. The exploitation of asynchronous time in the virtual Internet environment, in tandem with transformations in electronic transactions and monetary regimes, has transformed conventional industrial production processes and management models. The "digital revolution" has triggered a "paradigm shift", whereby the supply of production inputs, goods and services, covering every aspect of research and development, design, manufacturing, marketing, and transactions, has embodied a revolutionary change. As the fields of biochemistry, aerospace, materials science, and nanotechnology have experienced rapid successions of breakthroughs paced by the laboratories, so too have realms such as behavioral science undergone significant developments in theory and practical application through the interplay of information, communications, and computer technologies, unleashing vigorous entrepreneurial spirit and bringing it to bear on every facet of organizational operations.

Innovations in technical applications and know-how have introduced new game rules to markets, propelling a new wave of government regulatory measures including the regime of intellectual property rights and competition policy reforms. The knowledge-based economy has become the major trend in international society in the 21st century. Exploring the characteristics of the knowledge-based economy and establishing an appropriate economic paradigm for accelerating technological innovation is an urgent task for governments. Therefore, in a knowledge-based economic system, the issues concerned with the challenges and the adaptation of competition policy require profound discussion.

In the modern society in terms of globalization and technological revolutions the contemporary economy into a so-called "knowledge economy" (KE). This type of economy defined as an absolutely new type of organizations and work govern the world of business, demanding the rapid development of skills, solid knowledge and greater responsibility. In the research of Hadad (2017) modern civilization as a result converts to a learning society, adjusting to the innovative society, besides this meaning, educational systems should strive to form people who has opportunity to develop skills, to unite fully in the sociocultural background in which they live (Myburgh, 2011). From the middle of the last century, some arguments and disputes arose in the appropriate literature on modern society. In contradiction of this background, the first signs of a new society, a society based on education and knowledge, were discovered. Globalization has helped to more easily distribute new knowledge. Moreover, this was mainly due to modern technology. According to Hadad (2017) over the past years, four main concepts have been used in literature (Figure 1):

The first two main concepts are currently chosen by international organizations and influential politicians and will also be used in this document (Weber, 2011). However, this both words 'knowledge economy' illustrate the most important aspects of the whole concept: knowledge, the "driver of economic development" (Lin, 2006). In fact, the knowledge based economy develops constantly as a direct result of the important increase in knowledge in all economic processes and sectors of the economy (Davenport & Prusak, 2000; Movitz & Sandberg, 2009; Nonaka & Takeuchi, 1995; Rooney, 2005; Tchamyu, 2014; Viedma & Cabrita, 2012).

Figure 1. KE main concepts

A fundamental part in knowledge management is to spread and make knowledge accessible and usable within or between chosen organizations. When reviewing literature, there are some terms that seem more central and fundamental than others. For example, in the view of the knowledge-based firm creation, coordination, transfer, and integration of knowledge creates competitive advantages for firms. In addition to the statement above, proposes that knowledge transfer (KT) is a fundamental process of civilization and that it is central to learning which in turn is critical to development, there is clear support for exploring the term knowledge transfer.

It can be argued that in aiming for efficient knowledge-based economy, the search for “correct” choices of methods and steps is crucial. These choices require a well-defined taxonomy with clear concepts and terms. The content and meaning must be clear cut and there should be no ambiguity about the aim when fundamental concepts are used. Although this is undoubtedly a desirable objective, it is hardly the current state of affairs regarding commonly used terminology in knowledge-based economy. In many cases, the authors use central terms interchangeably and without making a distinction between them and sometimes without sufficient explanation of from which perspective the terms are used.

Clarifying the concept of “knowledge economy”

As the study of literary sources on the problems of the development of a knowledge-based economy shows, there is still no unanimous opinion among researchers on its quantitative and qualitative parameters. For example, in Blackler (1995); Bolisani and Bratianu (2017); Bratianu (2013); Asongu (2015) the following characteristic of a knowledge-based economy is given:

A knowledge-based economy is formed as a result of transformation into a diversified economy based on the production of high-tech products.

In a knowledge-based economy, the production of goods, works and services is based on information technologies that allow workers, firms and companies located in different parts of the country to communicate in real time using the Internet, personal computers, mobile communications and electronic commerce.

The system of relations between firms, companies, banks and other institutions is built in a knowledge-based economy on the exchange of computer digital codes (Bratianu & Bolisani, 2015).

The products of a knowledge-based economy are characterized by weightlessness due to miniaturization, the use of materials with predetermined properties. The products of a knowledge-based economy have inaccessible durability, durability, and efficiency. Such goods are distinguished by high labor intensity and added value. For example, the parameters of a knowledge-based economy are given in Alavi and Leidner (2001) where a knowledge-intensive economy is presented as a system in which products that change life, life and production do not have physical weight, in the sense of the physical mass.

According to Lu Yongxiang (1999), President of the Chinese Academy of Sciences, in a knowledge-based economy, the center for economic growth shifts to information technology, biotechnology, the creation of new materials and new sources of energy, as well as knowledge-intensive service industries such as advisory activities. "The high-tech economy," says Lu Yongxiang, "develops thanks to the knowledge and intellectual abilities of a person, so it is a form of economy that will apparently lead to the saving of resources, the coordinated interaction of man with nature and to sustainable development".

According to another point of view (Maximtseva, 2010), a knowledge-intensive economy is "... an economic system characterized primarily by the use of new technologies and discoveries in various areas of human activity, a large volume of already existing scientific knowledge, the generation of new knowledge, a high degree of motivation for the pursuit of innovation".

From the point of view of the Russian economist I.A. Maksimtseva (2010), the term "science-intensive economy" should be understood as an economic system characterized by the use of intellectual resources, new technologies and discoveries for the production of science-intensive products, the generation of new knowledge with a high degree of motivation for the pursuit of innovation. Also I.A. Maksimtseva (2010) considers incorrect the use of the concepts "knowledge economy", "information economy", "electronic economy", "network economy" used in the scientific literature as identical to the term "knowledge-intensive economy". These terms differ in content because each of them reflects the authors' point of view on the prevalence of this or that factor in production processes: in the "information" economy, the leading factor in production is information, the supporters of the "electronic" and "networked" economy are considered as constituting development of information and communication technologies, etc.

In the fair opinion of a number of scientists, in the science-intensive economy a special role is played by the creative, creative abilities of man. Melnikov (2010) told that a high-tech economy is an economy based on the creation and application of new knowledge about the world around, received by a person, his skills and skills in practice. As the main capital and resource of this stage of development of the economy is the intellect, the mind of man, embodied in his creative, creative actions Intellect in this case acts as a "basic" capital, and creative (or creative) actions, manifested through the creative energy of all market participants, are "negotiable" (sold or exchanged) capital.

Summarizing the analyzed literature, we believe that we should agree with researchers who consider the concepts of "information economy", "post-industrial economy", "new economy", "knowledge economy" and "knowledge-based economy", synonyms. In our opinion, they characterize identical transformational processes in the economy, based on the production of high-tech products, mainly based on the use of new scientific ideas, inventions, discoveries, and innovative technologies.

Literature review

The term knowledge-based economy, coined by the OECD in the 1990's, defined a type of economy which was "directly based on the production, distribution and use of knowledge and information" (OECD, 1996). At that time, it was hoped that the convergence of knowledge/ information and computer technology will become "the main driver of growth, wealth creation and employment across all industries" (APEC, 2000). Previous theoretical work by P. Drucker referred to the "knowledge society", a society in which the basic economic resources were no longer capital, natural resources and labor, but knowledge. Therefore, organizations were challenged to build systematic practices for managing self-transformation (Drucker, 1993). Economic analysts believed that knowledge can do more than increase economic growth; it can lead to structural economic and social change by affecting the volume of unemployment, the technological policy, the regulatory framework of a country's economy, the way work and production were organized (Soete, 1996), even the way life was lived (Neef, 1998). However, in 2001, the uneven rate of growth in several OECD economies was attributed not to knowledge production and distribution but to "information and communication technologies (ICT) (particularly investment in ICT), as well as to an increased use of quality labor and to the multifactor productivity growth arising in part from increased business innovation" (OECD, 2001).

There are two main economic theories that attempt to clarify the role of knowledge and technology in making sustained economic growth possible: the new growth theories and evolutionary theories. They have been developed when some economists have "perceived the limits to growth that finite resources and undesirable side effects would pose if no new recipes or ideas were discovered" (Romer, 1993). An economics of ideas as opposed to the economics of objects, which has been studied for centuries, has been proposed, in the hope that new ideas would increase a country's total stock of knowledge leading to sustained economic growth.

The new growth theories (also referred to as endogenous growth theories) consider (technological) knowledge a special type of commodity and use the standard neoclassical general equilibrium models to analyze the production, exchange and use of knowledge. The new growth theories highlight two main growth mechanisms: a) incremental learning and b) investments in R&D (innovation). The first is advocated among others by Lucas (1988, 1993). The second, pioneered by Romer (1986, 1990), Grossman and Helpman (1991), and Aghion and Howitt (1992), explains growth through the combined private and public aspects of investments in R&D. What provides the economic incentive for innovation is the partly "excludable" character of knowledge through the use of intellectual property rights (patents etc.). By exercising his/her intellectual property rights, the innovator, seen as a perfectly rational agent endowed with perfect information, may retain some of the rents accruing. Nonetheless, some of the new knowledge spills over to the rest of the economic system and increases the

social pool of public knowledge, which helps foster new innovations and hence allows growth to continue.

Attempts to empirically verify the new growth theories did not bring many results. Inferring from external R&D the internal productivity of firms and industries, Griliches (1992) measured some technology spillovers. A study by Jaffe and Trajtenberg (2002) identified knowledge flows and technological interaction by surveying patent data. Most new growth theorists find it difficult to treat knowledge as a good, albeit a special kind of good, because of the lack of analytical instruments:

If knowledge is indeed different from other goods, then it must be measured differently from other goods, and its relationship to the price system must be different from that of other goods. But the theoretical foundation on which national income accounting is based is one in which knowledge is fixed and common, where only prices and quantities of commodities need to be measured (Howitt, 1996, p. 10).

Evolutionary economic theories (also referred to as system theories) encompass a number of streams of thought all based originally on Schumpeter's logic of "creative destruction" (Schumpeter, 1934). The main idea in these theories is the perception that innovation, and the technological and organizational changes associated with it, are the key drivers of long-run economic growth (Bryant & Wells, 1998).

The knowledge-based economy should aim higher than the mere amassment of technological knowledge of how to subdue reality to the wishes of men in the hope that this will make societies wealthier and happier. It should deepen the knowledge of humans as they are moral warts and all. The missing moral dimension of knowledge must be cultivated (Sabau, 2006) through recovery of a body of ideas that informs the moral order of classical liberalism, an order which emphasizes freedom within the limits of physical and institutional (legal and ethical) constraints and impartial justice rooted in the moral equivalence of persons. This "thick" morality of a self not abstracted from communal values and commitments (MacIntyre, 1981) offers a better normative stance for the promotion of sustainable development.

Methodology

To analyze and solve the research problem, we reviewed the literature with three databases. First of all, we reviewed the most famous and large databases: Google Scholar, SCOPUS and Thomson ISI Web of Knowledge. The public Google Scholar over the Internet was rejected as part of our study. Because according to (Harzing and Wal, 2008). We cannot consider Google Scholar as a lack of analytical tools of citation information (Li et al., 2010) also Google Scholar demonstrated insufficient knowledge and understanding of the main issues of citation indexing. On the other hand, P. Jacso (2005) compared the three famous datasets, Scopus, Web of Science and Google Scholar, on different grounds and bring into being that the last one demonstrated insufficient knowledge and understanding of the main issues of citation indexing.

Meanwhile Boyle and Sherman (2006) indicated that has the oldest database, it has strong coverage with citation data and bibliographic data which goes back to 1900. WOS claims as it has the most depth and the biggest database with the wide range of records.

Findings

Firstly, we focused on total quotes of documents. In the Figure 3 we can find the chronological segmentation of the papers using three categories: 18443 in general and 7543 in “Management”, “Economics” and “Business” category of publications.

All data was collected from WOS database on the current date 17 of February 2018. First, we gathered 25,097 documents by searching in “Topic” field the words “knowledge economy”. Further we considered 18443 publications in our data set, which is designated as a “general” category. The extracted publication types include articles, proceedings papers, books reviews, editorial materials and others (Figure 1).

Figure 1. Observing general category by publications by types

Figure 2. Segmentation of “Management”, “Economics” and “Business” category documents by types of publication

In the second stage of our research include more deep analysis to the specific subject are "Management", "Economics" and "Business". As a result, there were found 7543 documents (Figure 2). In more detail publications were analyzed using authors' bibliographic information, years of publication, content coverage, counties, journal names and citation frequency

According to Figure 3 the earliest article studied knowledge economy was published in 1977. However, there was insignificantly number of publications until 1991 (not more than 10 per year in both categories). In 1992 - 1997 the amount of publications increased in both "general" (from 22 to 126 respectively), although "Management", "Economics" and "Business" still has half of "general" publications in a year. Amount of publications in "general" overcome 1000 only in 2009. For example, there were 1053 publications for 2009, 1206 for 2012 and 2078 for 2016. The same taps can be considered to the "Management", "Economics" and "Business": 128 for 2001, 513 for 2010 and 797 for 2016. For 2018, the data given only for two months (January to February).

Figure 3. Number of publications per year.

Web of Science has 252 subject areas clusters in publications. We took only 18 subject areas with more than 500 publications (Figure 4). Consequently, the mainstream of publications in "Management" (3874 papers), "Economics" (3456 papers) and "Business"(2753 papers) were related to the field of "Education educational research".1718 publications, "Environmental studies" – 1122, to "Geography" – 1120, "Planning development" – 1111, "Computer science Information systems" – 943, "Operations research Management science" - 910, "Social science Interdisciplinary" - 785, "Information science Library science" – 712, and "Environmental science" - 657. Other fields like "Engineering electrical electronic" (605) and "Computer science Interdisciplinary applications" (598) have fewer publications than those mentioned above. "Management", "Economics" and "Business" has 10083 publications, where Procedia Social and Behavioral Sciences Journal 177 publications, European Planning Studies and Research Policy – 114 and 131 respectively. These figures confirm our assertion that studies related to the knowledge economy from the managerial and economic approach are not sufficiently developed.

Figure 4. Segmentation of publications by clusters

Further, we confined publications to “articles”, in the “general” category there were 7545 articles among 18443 documents. Analysis recognized that the most citable document was written by M.E. Porter (1998) and published in *Harvard Business Review*. After that we choose articles with at least 500 citations in total. As mentioned earlier the first paper appeared in the Dataset written by G.P. Sweeney in the *Information Scientist* in 1977. Four articles among these 15 papers have more than 500 total citations. By analysis of annotations of 15 articles, we found that 2-ranked paper and 14-ranked paper are specifically dedicated to knowledge economy, whilst others have geography and environment. This paper was published in *Progress in Human Geography* and *environment and Planning A* journals. In addition, we calculated the annual quotes for each article that showed that the annual quotes of articles rise accordingly with a large number of cites.

Table 1. Articles with the quotes of citations more than 500 citations in “general” category

Nº	Cites	Author(s)	Title of Paper	Publication name	Publication year	Cites per year
1	1990	Porter, ME	Clusters and the new economics of competition	Harvard Business Review	1998	94.76
2	1465	Bathelt, H; Malmberg, A; Maskell, P	Clusters and knowledge: local buzz, global pipelines and the process of knowledge creation	Progress in Human Geography	2004	97.6
3	1207	Porter, ME	Location, competition, and economic development: Local clusters in a global economy	Economic Development Quarterly	2000	63.53

No	Cites	Author(s)	Title of Paper	Publication name	Publication year	Cites per year
4	1088	Kale, P; Singh, H; Perlmutter, H	Learning and protection of proprietary assets in strategic alliances: Building relational capital	Strategic Management Journal	2000	57.26
5	950	Teece, DJ	Capturing value from knowledge assets: The new economy, markets for know-how, and intangible assets	California Management Review	1998	45.24
6	845	Maskell, P; Malmberg, A	Localized learning and industrial competitiveness	Cambridge Journal of Economics	1999	42.25
7	759	Owen-Smith, J; Powell, WW	Knowledge networks as channels and conduits: The effects of spillovers in the Boston biotechnology community	Organization Science	2004	50.60
8	737	Javorcik, BS	Does foreign direct investment increase the productivity of domestic firms? In search of spillovers through backward linkages	American Economic Review	2004	49.13
9	645	HEDLUND, G	A model of knowledge management and the n-form corporation	Strategic Management Journal	1994	25.80
10	617	Verrecchia, RE	Essays on disclosure	Journal of Accounting & Economics	2001	34.28
11	608	Malmberg, A; Maskell, P	The elusive concept of localization economies: towards a knowledge-based theory of spatial clustering	Environment and Planning A: Economy and Space	2002	35.76
12	600	Furman, JL; Porter, ME; Stern, S	The determinants of national innovative capacity	Research Policy	2002	35.29
13	595	Frenken, Koen; van Oort, Frank; Verburg, Thijs	Relate variety, unrelated variety and regional economic growth	Regional Studies	2007	49.58
14	504	Coe, NM; Hess, M; Yeung, HWC; others.	'Globalizing' regional development: a global production networks perspective	Transactions of the Institute of British Geographers	2004	33.60
15	503	Henderson, R; Cockburn, I	Scale, scope, and spillovers: The determinants of research productivity in drug discovery	Rand Journal of Economics	1996	21.87

The same research was made to the limited groups – “Management”, “Economics” and “Business” (Table 2). We analyzed only papers with the type of article. So we collected 4358 articles among 7545 all documents. We designated 11 articles with more than 500 total citations. In these fields also the paper of M.E. Porter (1998) published in Harvard Business Review reached the most amounts of citations (1990 citations). Undoubtedly, our expectations were justified; the key areas of research in these journals are related to problems of business, management and economics. Two of the most cited articles were written by M.E. Porter.

Table 2. “Management”, “Economics” and “Business” articles with the highest number of citations

No	Publication year	Author(s)	Title of Paper	Publication name	Cites	Cites per year

In the next level of our research, we identified the countries with the largest number of articles devoted to the topic of knowledge economy. According to the "general" category the most papers published in the US, China and England (Figure 5). Meanwhile, outline is the same for "Management", "Economics" and "Business" category: leaders are the US, China and England. In Figure 5 we can find that a lot of countries study the problems of the formation of a knowledge-based economy, however developing countries consider knowledge economy in the prism of economic field. Kazakhstan also pays attention to this field of study.

Figure 5. Articles sorted by countries in the "General" category

Figure 6. Articles sorted by countries in the “Management”, “Economics” and “Business” categories

In the last stage of our research, we chosen 15 journals which have 60 or more articles devoted to problems of knowledge economy (Table 3). Altogether, these journals published 916 publications or 21 % of all “general” articles. Procedia Social and Behavioral Sciences with 182 papers (12%) stands out, followed by European Planning Studies with 131 papers (9%). Six journals have published more than 100 papers.

Table 3. Journals which have 60 or more articles devoted to problems of knowledge economy

Rank	Journal Title	Number of papers	Percentage of total (%)
1	Procedia Social and Behavioral Sciences	182	12%
2	European Planning Studies	131	9%
3	Regional Studies	122	8%
4	Edulearn Proceedings	116	8%
5	Research Policy	114	8%
6	Advances in Social Science Education and Humanities Research	113	8%
7	Inted Proceedings	95	6%
8	Technological Forecasting and Social Change	93	6%
9	Environment and Planning	82	6%
10	International Journal of Technology Management	80	5%
11	Proceedings of the European Conference on Knowledge Management	76	5%
12	Advances in Education Research	70	5%
13	Urban Studies	68	5%
14	Ekonomicky Casopis	65	4%
15	Journal of Cleaner Production	65	4%
	Total	1472	

We analyzed journals in “Management”, “Economics” and “Business” categories and selected 15 journals with at least 30 publications studied the topic. The data you can see in the Table 4). These 15 journals published articles related to the knowledge economy in total 916 articles.

Table 4. Journals which have more than 30 papers related to knowledge economy in the “Management”, “Economics” and “Business categories

Rank	Journal Title	Number of papers	Percentage of total (%)
1	Regional Studies	109	12%
2	Research Policy	109	12%
3	Technological Forecasting and Social Change	88	10%
4	International Journal of Technology Management	78	9%
5	Ekonomicky Casopis	60	7%
6	Technovation	59	6%
7	International Business Review	58	6%
8	Journal of Economic Geography	55	6%
9	Journal of Business Research	53	6%
10	Journal of International Business Studies	51	6%
11	Annals of Regional Science	46	5%
12	Journal of the Knowledge Economy	44	5%
13	Tijdschrift voor Economische en Sociale Geografie	38	4%
14	African Journal of Business Management	34	4%
15	Management Decision	34	4%
	Total	916	

Data given in the Table 4 shows that the three journals which published the highest amount of publications related to the topic are Regional Studies Journal with 109 papers (12%), Research Policy with 109 papers too (12%) and Technological Forecasting and Social Change with 88 papers (10%) and International Journal of Technology Management with 78 papers (9%). Other journals have less than 60 articles. Substantially that research interests of these journals are related to managerial science, which is close to the knowledge economy.

Summary

A knowledge-based economy is formed as a result of transformation into a diversified economy based on the production of high-tech products. A high-tech economy is not oriented towards consumption on a large scale of natural resources, but on a wider application. It is distinguished by the consumption on a large scale of new scientific knowledge, inventions, discoveries, new progressive technologies.

The relevance of growing information in studying knowledge economy shows the total number of articles in “general” category is 18443 and by analyzing chronological issue of papers, we can conclude that this topic became popular since 2000s. However, every year, the number of publications devoted to this topic is growing, as well as the number of citations of already available publications. Moreover, it should also be noted that interest in this area comes not only from economists and managers as well as researchers of other fields of knowledge.

It is noted that the most influential articles were published in countries such as the USA, China, and the United Kingdom. According this, our analysis showed that it is unlikely that any institution has clearly focused on researching the problems of the economy of the economy.

Journals like *Regional Studies*, *Research Policy*, *Technological Forecasting and Social Change*, *International Journal of Technology Management* can be useful for scholars who study knowledge economy.

The core value of the knowledge-based economy lies in “innovation.” The momentum behind innovation arises from “competition.” Furthermore, “fairness” and the “legal system” are the foundations of efficiency and healthy competition. Therefore, the substantial promotion of the Competition Act is the cornerstone of technological innovation and the development of the knowledge-based economy. The knowledge-based economy has become the major trend in global development in the 21st century. The digital revolution has resulted in a de-emphasis on the production processes and management patterns of traditional businesses, while knowledge-based enterprises using new business methods and models have prospered. Furthermore, the concepts of merchandisers, services, enterprises, consumers, supply, demand, transactions, price, and market scope are becoming more blurred. The well-behaved demand function and the law of diminishing returns to scale of traditional economies and the static productive efficiency from the supply side can no longer satisfy the need for a dynamic optimal allocation of resources. The positive feedback loop brought about by the network effect and characterized by the phenomenon of increasing returns to scale indicates that dynamic competition is more salient than ever before. Likewise, in this age of the knowledge-based economy, competition policy is contributing significantly to a country’s development on a long-term basis.

In addition, in this age of the knowledge-based economy, as key knowledge appears everywhere, market competition is becoming more severe than ever before. As consumers enjoy the fruits of a knowledge-based economy, they also take risks based on asymmetrical and incomplete information. These are all reasons why the competition law authorities get involved in the market. Even if the products, businesses, and technology in this age of the knowledge-based economy keep on being innovated, and the conditions related to market competition drastically differ from those of the past, the Competition Act’s principle of safeguarding fair trade and maintaining fair competition remains unchanged. Even more, it should be intensified because the results of restrictions on competition and technological innovation in a knowledge based economy are more serious than before, and have a widespread impact. In this age of the knowledge-based economy that calls for innovation and change, all merchandise can take on a new value through innovation. All businesses can increase their productivity by means of knowledge. If we can consolidate the execution of this competition policy,

and create a quality environment in which there is fair competition, this can help enhance competition and develop the market mechanism, thus causing economic resources to be allocated more reasonably and efficiently. Moreover, by doing this we can also encourage further technological innovation in business, thereby intensifying the development of economic vitality, and achieving sustainable stability and social prosperity.

Knowledge economy is not just a new theoretical concept, but a new epoch, which has a fundamental difference from the era of the agrarian and industrial economy (Valdez etc., 2016). Although its offensive appeared only in the early 90s, it already had an impact and caused changes in all spheres of economic and social life, and this influence is constantly growing. The trend of development of a Knowledge economy is the formation of a Knowledge economy, which will mean the onset of a new stage in the development of the global economy, namely, the stage of global economic networks.

Abstract. *This research paper sought to examine the role and contribution of Knowledge Management (KM) in UK Higher Education Institution (HEI) partnerships outcomes. The author conducted a qualitative research making use of semi-structured interviews with nine elite respondents who for the purpose of this research were defined as individuals that have been involved in initiating, developing and managing HE partnerships at executive levels. The analyses demonstrate that HEI partnerships may produce a wide range of outcomes depending on the external factors, purpose, length, specialism, and priorities of the collaboration. Nevertheless, this research has identified 18 partnership outcomes which are grouped into three categories such as academic, financial and marketing and managerial outcomes. Results of the research infer that performing in accordance to partner's expectations helps overcome trust related issues thus building confidence in partners. The establishment of confidence might lead towards exploring other collaborative possibilities and therefore be able to have a combination of academic, financial and marketing and managerial outcomes at the same time. Results show that nurturing and supporting the application of KM activities is essential in allowing the HE partners to share, transfer, apply and absorb the knowledge needed to attain the intended partnership outcomes. The extent to which knowledge is exchanged and distributed within and across HEI partners might encourage the development of new products and services which in return helps an HEI to minimize risk through portfolio diversification and establish a sustainable business model.*

Keywords: *Academic Outcomes; Financial and Marketing Outcomes; HE Partnership; Knowledge Management; Managerial Outcomes.*

Introduction

According to Higher Education Funding Council for England (HEFCE) (2017) Higher Education (HE) in the UK is of a high importance considering its impact in society and the economic development that derive as result of the diversity of knowledge and expertise found amongst educational institutions. As the HE sector is becoming fiercer Universities are continuously exploring alternatives to ensure sustainable market development. According to HEFCE (2017), HEIs in the UK differ in size, ethos, expertise, mission, and vision and are highly autonomous. Nevertheless, the UK HEIs experience common challenges which according to HEFCE (2017) are related with the student cap,

funding cuts, market diversification, technological enhancement and sustaining high-quality research to mention few. These challenges have increased the competitiveness of the HE sector and encouraged HEIs' to exploit opportunities of partnering in order to transform the challenges into opportunities through a combination and utilization of physical, financial and intellectual resources. According to HEFCE (2017), the collaboration between HEIs is designed with the purpose of attaining outcomes that an HEI would not be able to achieve individually and therefore seeks to join efforts with another HEI in order to attain the desired outcomes. However, the nature of partnership outcomes can differ depending on the level of interaction, engagement, and trust established between HEI partners. Although establishing a clear understanding towards the desired outcomes to be achieved through a partnership is fundamental, Ankrah et al. (2013) argue that HEIs should also be resilient in adapting and altering their actions in accordance to the partner's expectations. The willingness and ability of a HEI to support the transition into a partnership may lead towards additional outcomes that HEIs' did not consider at early stages however add value to both institutions and enhance their individual position in the HE sector. Therefore, it is important to establish an understanding of the type of outcomes that HEIs' could attain as acknowledging the potential outcomes could provide an opportunity for HEIs' to develop a more effective strategy and be able to enhance the allocation of resources for the potential outcomes.

Research context

The development of HEI partnerships involves a high level of exchanging knowledge across partners. The extent to which the required knowledge is circulated, stored and used is a significant indicator of the success of the partnership. Thus it is important to understand and take a holistic approach in designing and using Knowledge Management (KM) activities related to knowledge accessibility, repository, sharing, transferring, integration, application, and evaluation.

This research paper seeks to examine the role and contribution of KM in UK HE partnership outcomes. Using a tree analogy Elezi (2017) proposes a conceptual model, named KM Partnership Tree (see appendix 1). The conceptual model aims to explain the role of KM in facilitating the development of HE partnerships by presenting the Behavioral KM Constructs, which includes elements of culture, trust, absorptive capacities, and communication, as the foundation of a partnership development. Afterward, the conceptual model continues to list the institutional and partnership factors required accompanied by the KM activities needed to be applied in order to facilitate the integration of HEIs'. The ultimate purpose of this work is to understand the nature of the partnerships outcomes, and using the tree analogy of the conceptual model to be able to identify the outcomes (fruits) of the KM Partnership Tree.

Literature review

KM is treated as a scientific approach that allows individuals, teams, and institutions to optimize the use of information at inter and intra-institutional levels. The application of KM helps institutions to strengthen their competitive advantage by making the most of the intellectual capacities, expertise, and resources in order to enhance market share and profitability. Management theories explain that KM is a multifaceted area which involves a range of activities with the purpose of generating and managing knowledge. According to Nonaka and Takeuchi (1995), KM is defined as "the capability of an

organization to create new knowledge, disseminate it throughout the organization and embody it in products, services, and systems". The evolving nature of economies, from an agricultural economy to industrial economy and knowledge economy in the early 2000s has placed more emphasis on educational institutions, which are seen as the centers of knowledge, in equipping the future workforce with the right set of skills and knowledge required to support the knowledge economy. However, with differences noted amongst HEIs in terms of expertise, resources, location, opportunities and challenges the competition is becoming fiercer, and establishing and maintaining a competitive advantage, harder. Therefore, many HEIs have considered the formulation of partnerships as an approach to overcome competition and make a better use of institutional resources in order to attain the desired outcomes in the most cost-effective manner. Nevertheless, the success of a partnership strongly relies on the ability of partners managing the existing knowledge which due to several reasons related to culture, trust, absorptive capacities, and communication (Elezi, 2017) may cause misunderstandings, disagreements and/or raise barriers in exchanging knowledge adequately. Therefore, the application of KM principles within a partnership context may assist not only with the achievement of initial partnership outcomes but as discussed by Yarime et al. (2012) but could allow HEIs to explore and consider possible outcomes as a result of synergy established amongst partners.

Altbach (2015) and Lozano et al. (2013) explain that effective application of KM in HEI partnerships has had a positive impact in enhancing students' recruitment campaigns, learning experience and performance as well as training and development opportunities for administrative and teaching staff. However, Fullwood, Rowley & Delbridge (2013) explain that due to complex nature of partnerships is very important for universities to undertake an inclusive approach and involve staff of different levels in sharing and transferring knowledge across teams and departments. Doing so aids the processing of absorbing new knowledge and contributes to collection of different insights and expertise which eventually leads towards the generation of new institutional knowledge (Sulisworo, 2012, Ankrah et al. 2013; Fullwood, Rowley & Delbridge, 2013, Elezi & Bamber, 2016).

KM in HEI partnership development

The development of partnerships amongst HEIs has been a strategy that is increasingly becoming more relevant due to market challenges and opportunities experienced in the education sector. Several studies have shown that during the formulation and management of HEI partnerships there is a significant amount of changes that occur within and between institutions and that management of knowledge capital is crucial (Gibb, Haskins & Robertson, 2012; Dalkir, 2013; Fullwood, Rowley & Delbridge, 2013; Etzkowitz & Ranga, 2015). As discussed by Hislop (2013) the role of KM takes prominence when aiming to design institutional and inter-institutional systems and activities that are required to support HE partnerships in exchanging and accessing the right information with the purpose of attaining the desirable partnership outcomes. Fullwood, Rowley, and Delbridge (2013) explain that a partnership consists of two or more institutions that decide to work together on the basis of a defined and agreed strategy that guarantees added value to the delivery of existing products and services. Li et al. (2014) emphasize that partnerships assess alternatives for improving the use of resources in order to expand their portfolios and generate new products and services. Li et al. (2014) and Fullwood, Rowley, and Delbridge (2013) argue that formulation of

partnerships present opportunities to attain new knowledge whilst sharing financial risks. Bryson (2016) discusses that establishment of HEI partnerships allows institutions to merge intellectual capacities in aiming to make the most of market opportunities, diversify portfolios, enhance the quality of services offered to students and diversifies students' bodies.

The understanding of the expected partnership outcomes could enhance the development of collaborative strategies between HE partners in terms of clarity, resources, and quality. Also, the identification of partnership outcomes may assist HEIs' logistically in regards to planning and controlling techniques required to successfully attain the desirable outcomes. Considering that HE sector is experiencing ongoing changes imposed as a result of legal frameworks and/or market developments, it has become very important for HEIs to create and apply effective strategies in order to address the strategic and technical challenges and take full advantage of market opportunities. Li et al. (2014), Fullwood, Rowley and Delbridge (2013) and Bryson (2016) explain that universities should seek to be resilient and encourage the sharing and transferring of knowledge not only to improve the operations between partners but importantly cope with changes and be able to promote innovative practices, products, and services that otherwise HEIs would not be able to achieve individually.

Several scholars have pointed out the pressure that HEIs experience in addressing scarce resources and the importance of stakeholders' support in ensuring a competitive position in the HE sector (Jones & Sallis, 2013; Li et al. 2014; Bryson, 2016). Similarly, Fullwood, Rowley, and Delbridge (2016) highlight that HEIs seek to establish a profile of highly reputable institutions that offer products and services of good value for money. If KM is applied effectively in HEI partnerships, then these institutions will be able to minimize the implications of environmental risks related to the new undertakings and new product development promoted to the HE market. Effective HEI partnerships demonstrate a positive effect on institutions' knowledge repositories and intellectual capacities which are essential in enhancing the quality of academic products and services as well as the reputation of a University (Sakamoto & Chapman, 2012; Fullwood, Rowley and Delbridge, 2013; Li et al. 2014).

Research methodology

The purpose of this research is to identify the outcomes of collaborative projects undertaken between HEIs. Ontologically this research embraces a subjective stance thus allowing for its epistemology to derive from a biased viewpoint. The author designed and conducted a qualitative research, gathering data through semi-structured interviews held with nine elite interviewees (EI) who for the purpose of this research were defined as individuals who have been involved in initiating, developing and managing HEI partnerships at executive levels. According to Bryman & Bell (2015) and Saunders (2011) embracing a qualitative research through the application of semi-structured interviews allows the researcher to gather insights from the participant and be able to probe at a deeper extent while gathering responses first hand. The application of semi-structured interviews helped the researcher gather examples and more detailed answers on the experiences of EI in managing HEI partnerships. Table 1 provides a brief overview of EIs professional profiles, explaining the position held, responsibilities, years of experience in HEIs and an approximate amount of income generated in the HEI partnerships participants were involved in.

Table 1- Elite interviewees' professional profile

EI No	Position held within the HE institution	Responsibilities	Years of experience in HE institution(s)	Amount of income generated
1	Assistant Director for Development and Innovation	Seek opportunities for partnership development and generate income streams	20	Circa £25 million
2	Vice Principal	Guide and support the HE teams in compliance with regulations and quality standards	27	Circa £7 million (in the last 7 years)
3	Corporate Development Director	Head of curricula development Developing strategic partnerships	18	Circa £15 million
4	Finance and Operations Director	Managing finances and operations People and resource management	10	Circa £10 million
5	Director of Academic Affairs and director of Research Institute	Managed academic teams and researchers in designing, delivering and evaluating teaching and research courses	28	Not less than £ 9 million
6	Pro Vice-Chancellor	Led and managed the development of academic partnerships within the UK and internationally Strategic Planning Committee	15	Circa £6 million
7	Executive Dean of Research Graduate School	Led and managed teams and assured that HE partners complied with the quality standards	26	Circa £48 million
8	Dean of Academic Affairs	Managing the academic responsibilities in a partnership	22	Circa £14 million
9	Executive Vice Principal Curriculum Planning and Quality	Overseeing curricula and quality side	20	Circa £8 million

Each of the interviews lasted approximately 15 minutes and was voice recorded and transcribed in order to proceed with thematic analysis where the author aimed to identify common patterns and extract themes and concepts noted amongst respondents' answers to further analyses and discuss in section 5.

Research results

The answers gathered from the EIs explain that the majority of partnerships are developed with the purpose of increasing market share and diversifying income streams. EI and EI3 explain that HEIs are very keen to expand market accessibility nationally and internationally with the purpose of recruiting more students, develop new academic programs, introduce new degrees and promote internship programs as ways of strengthening a University's position in the face of competition. For instance, EI5 stated that:

"Another partnership outcome is... income generation, development of new curricula, new income streams, knowledge transfer through different colleges and universities as a result of different partnerships and collaborative projects that we are involved in. Collaborate with other institutions to figure out if there is any opportunity for us to work on and get information on areas of activities where we could establish a win-win situation for both of the parties."

EI2, EI4, EI7 and noted that although a partnership has a financial tag attached to it in terms of costs and benefits, the financial perspective is not the only encouragement for HEIs to become involved in partnerships. EI2 highlighted that partnerships are often encouraged as a result of institutional needs and external factors which although are directly related to finances also bring attention to the element of quality. Additionally, EI2, EI3, and EI8 explained that in their experiences HEI partnership outcomes have improved the institution's presence in the domestic and international markets. The promotion received from collaboration with a highly reputable University has allowed the other partner to benefit from the visibility and market accessibility of the partner and be able to attract more students and/or staff.

Another outcome from HEI partnerships was related to the utilization of resources and facilities of the other HE partner which could include engineering centers, IT platforms, laboratories, libraries and other intellectual capacities found in a University system. EI1 also noted that some partnership outcomes have generated joint degrees where students have the opportunity to have a learning experience that takes place across different countries and enhancing their employability skills. Furthermore, EI4, EI6, EI8, and EI9 highlighted that additional partnership outcomes were related to the developments of new departments, validation of courses, and the development and training of staff in order to satisfy partner's expectations and attain the partnership's aim. EI 4 stated that:

I remember one of the main reasons we opened up the engineering department was due to the demand that we were receiving from our partners for engineering courses and therefore we started to design engineering courses and opened up completely a new organizational structure and a new department for engineering degrees which were delivered to staff of Oil companies from Libya, Qatar, Saudi Arabia, Bahrain, and Oman".

Similarly, EI6 discussed the course validation as one of the recent outcomes of the partnership his institution is involved in and stated that:

"We collaborated for a very short period of time with a college in the UK with a program studying horses. Now, we do not do anything with horses in our University due to the lack of resources as there are no courses with horses or horse management related. So we did not adopt their course but we helped them to complete the program that they were working on, in order to meet the validation requirements and we produced the degree that they needed and you could argue that it is an output for us couldn't you?"

Moreover, EI9 discussed that her institution has managed to introduce new qualification (degree apprenticeships), create knowledge repositories, and reduce any institutional risk by enhancing the portfolio diversification as a result of the partnerships they have participated in. EI2 expound that outcomes of a partnership are also experienced at an institutional level through the improvement of internal processes applied for quality measurements, staff, and student recruitment as well as enhance teaching and learning practices accompanied by university student services. EI5 and EI8 pointed out that a very important outcome consists of developing personal and professional relationships with educational agents who can supply Universities' recruitment offices with potential students. EI5 stated that:

"So typically you'll get relationships from outside the project if you like and this... we would be able to work together on other projects in other areas".

Similarly, EI8 stated that:

"This allowed me to work on networking, promote the university and develop relationships with potential suppliers of students. What we also developed was the opportunity for students to go and spend one year within the industry which at the time was not common... and this was part of the programs we designed ... So we developed an Internship Program and that is one of the outcomes".

EI5 continued to discuss that HEI partnerships also produce outcomes related to academic research which is mainly shared and promoted through academic forums, conference, journal articles and/or books. The academic outcomes are quite important as they add value to the institution particularly when undergoing through the assessment frameworks applied in the UK (Teaching Excellence Framework and Research Excellence Framework). EI5 stated that:

"So the idea was if you're going to get involved in a project do you think you'll be able to get a publication out of it...do you think you can get something that can be an output for the REF (Research Excellence Framework) so that will drive a lot of academics now."

Responses gathered from EI5 and EI6 bring to attention that other partnership outcomes experienced by HEIs have included accessing research funding, creating industry prototypes and improving the quality of institutional systems.

Analysis and discussion

The responses collected from EIs explain that although HEI partnerships are initiated as a result of a particular purpose because of development of trust, synergy, mutual respect and interest and performance HE partners are keen to explore other collaborative opportunities and or/projects. It is important to highlight that a rigorous application of KM activities wherever applicable allows the partnership to develop stronger and establish sustainable business operations.

According to Li et al. (2014) and Fullwood et al. (2013) developing a partnership indicates that there will be changes, alterations, and adjustments in respect to working practices and how individuals, departments, and institutions think and act. Therefore, there is a realistic opportunity that through partnership integration, institutions and individuals will realize that joint efforts and resources could also lead towards attaining additional outcomes that were not considered at the early stages of partnership development. It is noted that although the motivation for a partnership development may rely on financial grounds there could be a combination of outcomes attained as a result of collaboration. This research infers that the outcomes of HEI partnerships appear to be of an academic, financial and marketing and managerial background and are further discussed in sections 5.1, 5.2 and 5.3 respectively.

Financial and marketing outcomes

Results show that financial outcomes are experienced at a partnership level meaning that all involved partners directly or indirectly attain financial benefits from working collaboratively. As shown in figure 1, one of the fundamental financial and marketing outcomes focuses on increasing market share and accessibility as a response to competition. Fitzgerald et al. (2016) discussed that undertaking a collaborative approach allows HEIs to explore alternatives for minimizing risks and be able to establish new income streams. Research funding and diversification of income streams was another financial and marketing outcome which allows Universities to participate in funding schemes and support one of their fundamental purposes which consists of knowledge creation for the benefit of society. The knowledge created is sometimes reflected through the development of industry prototypes which was classified as another outcome.

Importantly, HEI partnerships have a positive impact in enhancing the international presence and reputation which provides a great opportunity to promote University's products and services through public relationships and promotion activities. A further outcome consists of developing relationships with agents and student suppliers which may help in developing effective and long-lasting recruitment channels. The continuous changes experienced at socio-economic levels set pressure on Universities' recruitment officers and the establishment of effective relationships with educational agents and/or agencies becomes very important.

Figure 1- Financial and marketing HEI outcomes

It is essential to establish a good understanding of what are the financial and marketing outcomes in a partnership. Doing so not only helps the partners to explore possible collaboration alternatives right at an early stage but aids with resource planning and allocation and identifies areas where further work may be required. For instance, a University may have consolidated its market share and accessibility, however considering market opportunities may require a stronger promotion of its products and services, possibly at an international level. Sakamoto & Chapman (2012) argue that successful partnerships are able to capture and deliver to a larger student population because of the variety of subjects and programs offered as a result of the collaboration. Having said this, the recruitment of new students for certain academic programs and levels is an important outcome that allows Universities to overcome challenges that relate to the design, delivery, and continuation of academic courses.

Academic outcomes

The results gathered from the EIs explain that in addition to financial and marketing outcomes, HEI partnerships attain a range of outcomes that are related to the academic spectrum as shown in figure 2. However, it should be noted that the academic outcomes rely on the effectiveness upon which KM activities are used. Through collaborations and exchange of intellectual capacities, expertise, resources, and institutional infrastructure Universities are able to design and deliver dual academic programs. As explained by Elezi (2017) KM in partnerships requires the application of rigorous KM activities known as knowledge accessibility, repository, sharing, transferring, integration, application, and evaluation.

For instance, Li et al. (2014) argue that the development of academic dual programs helps Universities to attain a stronger competitive advantage. However, as noted in Elezi's (2017) work, the development of HEI partnerships requires a significant amount of knowledge exchange between partners and the application of KM activities is essential in applying effective KM within a partnership scenario. The dual degree programs appear more attractive to students who see these programs as good value for money and have the opportunity to participate and engage in multidimensional socio-academic environments through exchange programs or other alternatives. In addition, from an academic perspective the most common outcomes are related to the course development (i.e. Bachelor, Master and Ph.D. programs) and course validation which come as a result of market opportunities but my lack in expertise or quality standards from one of the partners. Having said this, the development of new academic programs and course validation may lead HEI partners towards new outcomes were in response to market demands and opportunities a University could develop new qualifications and departments.

Furthermore, in response to labor market changes and requirements, in terms of employability skills and transferability of technical and soft skills Universities are focusing in providing the student with industrial experience as an approach to contribute to the development of student through a combination of theoretical and practical understanding. According to Etzkowitz & Ranga (2015) Universities are strengthening ties with industry through a range of Knowledge Transfer Partnerships (KTP) which primarily aim to bridge academia and industry for further development but also equip students with industry insights and prepare them for the job market.

Thus, Universities have been working collaboratively to design internships and placements that address the industry's expectation in terms of employability skills.

Figure 2- Academic HEI outcomes

HEFCE (2017) explains that UK HEI staff are increasingly experiencing pressure on producing research publications in order to prepare Universities for the REF assessment as it is amongst the main assessment criteria. Having said that, the pressure set by universities in publishing has encouraged the development of partnerships between Universities at an individual and departmental level where the focus is to collaboratively produce scientific work published in high ranking scientific journals or books. The REF assessment values more any research undertaken between individuals working for different Universities as an approach of encouraging collaboration and knowledge sharing and knowledge transfer across UK Universities. Although these are academic outcomes, still have financial implications for the partner institution. However, the purpose is to understand what possible outcomes a partnership could attain from an academic perspective which can then be used by the senior management to design and apply effective KM strategies to support and facilitate the achievement of academic outcomes.

Managerial outcomes

The development of partnerships brings positive results in terms of managerial practices for a given HEI. As partners have to establish a good level of synergy between their operations and actions there is an expectation that some managerial practices will experience changes. Thus, the partnership generates managerial outcomes which help partners improve institutional efficiency and effectiveness and be in line with the partner's expectations. One of the main managerial outcomes in HEI partnerships consists of improving University student services. However, in order to enhance student services, there is a compilation of activities that require improvements mainly related to the quality of processes and procedures regarding recruitment and selection policies for HE staff and students. For instance, one of the HE partners might require the other partner to redesign or develop new recruitment and selection processes for recruiting lectures of a certain specialism that interested HE partner has no previous experience on. As discussed by Li et al. (2014) initial concerns of an HE partner while considering partnership opportunities are related to the capabilities of the partner to deliver at the

expected quality standards. The capability concerns of a partner are associated with the facilities and resources as well as institution's intellectual capacities and systems. Therefore, the integration and synergy developed amongst HEI partners' leads towards an institution being able to utilize partner's facilities and resources which may involve classrooms, laboratories, online libraries and/or IT facilities. In addition, the application of KM activities encourages the development of knowledge repositories due to the exchange of know-how and other relevant knowledge needed to carry out collaborative tasks and attain partnership's outcomes.

Figure 3- Managerial HEI outcomes

Moreover, it is essential for HE partners who seek to enter into partnerships to demonstrate the level of expertise and quality standards required by the partner who is expected to offer assistance with the academic technicalities of developing and delivering new courses or programs. Being able to recruit the correct caliber of academic staff is expected to have a direct impact on the improvement of teaching and learning practices which are amongst the main criteria Universities are assessed on. In return, the improvement of teaching and learning practices will set a University in a more competitive position which sets the institution in better-negotiating positions for future collaborative opportunities as well as strengthens its reputation within the HE sector. Another outcome that derives from HEI partnership relates to staff training and development programs which seek to address issues and concerns related to managerial practices and activities of an academic and administrative nature.

Research implications

The identification of partnership outcomes may be beneficiary at strategic and operational levels. At a strategic level, the implications of this research may be considered from the executive managers responsible for the development and management of partnerships in regards to institutional policies and procedures of collaborative work. At times, individuals may want to become involved in collaborative projects, however, the institution's policies and procedures may be rigid and thus delay the progression of the partnership and raise barriers between partners and questioning the desire of the developing the project. While the implications at a strategic level are related to the institutional policies and procedures of designing a partnership, at an operational level implications are more of a "hands-on" approach.

Operationally, institutions may need to assess the effectiveness of day to day activities with communication and managerial practices being the main focus. The identification of possible partnership outcomes may be used to clarify the communication channels in the context of roles and responsibilities, frequency and medium used to facilitate the exchange of knowledge within and across partner institutions. Although HEIs involved in a partnership may have previous experiences due to the differences noticed amongst institutions it may be required to reconsider institution's managerial practices in accordance with the expertise, resources, and culture of the partner in order to aid the partnership synergy.

Conclusions

This paper sought to deepen the understanding of the nature of outcomes that HEIs attain when working collaboratively. As a result of a fierce competition and the socio-economical and legal changes within the HE landscape, educational institutions are exploring opportunities to join forces in adding value to their products and services. The fundamental justification for the development of an HEI partnership is related to the betterment of financial conditions and risk minimization. However, this research aimed at providing a robust view that goes beyond the financial benefits and elaborated on a range of outcomes that directly and indirectly have an impact of the financial profitability and intellectual wealth created as a result of applying KM activities in collaborative projects. Having established a decent understanding of the potential outcomes that could derive from HEI partnerships may help institutions to embrace and apply effective managerial practices. Application of effective managerial practices would be possible through a clear indication of what partnership outcomes partners are working towards and be able to allocate the adequate resources, provide the required planning and assign the right expertise to complete the necessary actions. Doing so is of a high importance, particularly in the early stages of the partnership where individuals are concerned with the financial risk and communication channels are not consolidated yet. Comprehending the potential outcomes opens opportunities to examine if institutions need to readjust or redesign their academic and managerial practices in order to achieve the ultimate purpose of the partnership. As the development of a partnership indicates change and integration for individual institutions, chances are that institutions will alter their institutional practices resulting in academic and managerial practices that add value to their educational products and services. Being aware of potential outcomes may help institutions to save cost, operate more efficiently and effectively and therefore increase the prospect of formulating a successful partnership.

Abstract: *The topic selection of this paper is motivated by several aspects like its intriguing character, the challenges that promotes, the multiple perspectives it requires and mostly by the potential it has of generating positive effects for society. The roles of the university changed across history enumerating titles as: moral symbols, social etalons, education providers and innovation facilitators, promoters of entrepreneurial talent, economic and civic leaders and mostly as knowledge pioneers. Throughout the content of this paper we argue, in the first section, the major roles that the university played across time, the ones that it presently performs and we forecast its future powers. Within the second section of the paper we connect the paradigm of the 'learning organization' with the strategic knowledge management model for transforming the potential of the university (in terms of intellectual, financial, material resources) into operational (pragmatic) results. The undeniable strategic advantage of universities is that they can equally provide information and knowledge to both the private and the public domain. Debating about the options of transforming a university into a learning organization will provide new directions for the university leaders in order to increase their value creation for society. Throughout the third section of the paper we will present 'the University agenda for developing students' skills in the knowledge economy'. Under this section we approached the major shifts on the labor market regarding the employability skills. Further we provide argumentation for the most wanted categories of skills in the time horizon of 2030, which are considered to be: fluency of ideas, judgement and decision making, originality, active learning, system evaluation, learning strategies, complex problem solving, critical thinking, system analysis, deductive reasoning. In this context we analyzed the university contribution and perspectives as main player.*

Keywords: *employability; labor market; learning organization; knowledge economy; skills; university.*

Introduction – University role of transferring knowledge

The theories about the influential roles and strategical 'skills' of universities have been intensively debated during the last decades and many of them have been implemented throughout large scale projects. Due to the speedy developments in all areas, education must increase the rhythm of adapting its structure and processes in order to respond to the global market requirements (Altbach & Salmi, 2016; Bratianu, 2018; Hapenciuc et al., 2016; Störmer, 2014; Volkmann, 2014).

During historical stages, the teaching paradigm has switched from teaching knowledge to teaching skills. In this sense, universities have mainly the role of educating students in terms of providing them with the necessary skills for future job tasks. The knowledge transfer of technical and soft expertise towards students represents actually the central part of the university activity. Universities are perceived also as social and civic leaders because there are situations when they can influence the public opinion, they can support a social cause, they can provide consultancy for local development strategies or promote public engagement, community well-being and active citizenship skills (Prelipcean & Bejinaru, 2016).

Today, universities are seen to act like magnets that attract investments and are even assigned the role of economic ambassadors. The presence of a strong university certifies a valuable social and economic environment in which companies can identify the talent resources needed for their field. Universities are given the role of anticipating the needs of the market that are to come and are thus called upon to be involved in creating policies that stimulate research and innovation to increase efficiency and efficacy (Altbach & Salmi, 2016; Bejinaru, 2017, 2016; Bratianu & Pinzaru, 2015).

University needs the skills of the 'learning organization'

In the perspective of this review paper, we will discuss the potential of a university for developing its teaching skills in accordance with the necessities of the knowledge economy. In this sense, we will provide arguments firstly based on the theory of the 'learning organization' and within the further sections, we will argue the potential contribution of the University for delivering the forecasted skills for 2030. The theory of the university as a learning organization is going through its expansion stage and are required new explorations starting from the real world and going toward some levels of abstractions which will allow scientists to reveal new principles and mechanisms able to increase the power of that paradigm. In the same time, universities face today an intense competition as a result of globalization and mostly of the ranking systems which influence their financing resources and their intellectual capital dynamics (Bratianu and Bejinaru, 2016; 2017). Searching for ways of transforming universities in learning organizations will lead to new perspectives for academic leadership to conceive strategies to increase their value creation for society (Chan & Lo, 2007; Davenport & Prusak, 2000; Örténblad, 2015; Powell & Snellman, 2004; Senge, 1999).

Universities must continuously look forward to becoming learning organizations, in the sense, explained by Peter Senge (1999). Nowadays higher education it is strongly linked with research and innovation and thus plays a crucial role not only in individual and societal development but also in the process of delivering the European Union's strategy, to drive forward and maintain growth in each and every domain. Universities are the main actors responsible to provide the highly skilled human capital that Europe needs in order to create jobs, economic growth, and social prosperity. This role has been designated by a considerable body of academic researchers after evaluating the effects of intellectual property and technology transfer policies on research activity and on academic and business communities (Bejinaru & Hapenciuc, 2016; Barath, 2015).

Well-known authors and researchers of this subject say that universities would greatly benefit if they succeed to become learning organizations (Spender, 2014). This growth

potential resides in transforming their theoretical knowledge into practice and also the individual knowledge of its staff into organizational knowledge. Of major importance is the aspect of universities' adaptation to the features of this new economic and social environment which means continuous change and increasing competition. Nowadays, a new challenge is to prepare students for jobs that are not known at the time of their training and to teach them to solve problems that haven't even been. Thus achieving the functional status of a learning organization will enable universities (and implicitly their stakeholders) to strategically adapt and survive to any possible futures. The sustainable competitive advantage is crucial for universities also. On one hand, companies strive to obtain growing profits and are stimulated to continuously adapt to the changing environment and to consumers' preferences. On the other hand, universities are motivated by a core set of principles in order to preserve the significance of their *social role* (Barath, 2015; Deca, 2015; Duderstadt, 2003; Bejinaru & Iordache, 2011).

The research topic is very complex since learning organizations constitute at this moment desirable knowledge-intensive organizations and the theoretical and practical research are still in the extensive stage. For example, in Romania, debates in this domain are striving to reach the critical mass necessary for implementing adequate changes. Romanian universities are coming out of an over-centralized system and even if they got some autonomy in decision making on curriculum and internal structure organization, they need a great effort to compete against world-class universities and to create value for society at the requested levels of the knowledge economy. Since almost 30 years ago the Romanian Higher Education System represents a testing laboratory for various international processes, norms, and institutions that have contributed in many attempts of reformation during the transition to democracy. Even if the Romanian Higher Education System has been defined as a national and European priority (according to Strategy Europe 2020), reforms in the field have rarely been coherent and with a positive impact on this domain development.

In a recent post of international rankings (SCImago Institutions Ranking) Romanian universities have positions that make us proud and strongly motivates the young leaders. Additionally, there are some better positions obtained on disciplines, which demonstrates that there are some isolated nuclei (as more compact research teams) that generate performance (Deca, 2015). A valid example we consider the fact that "Ștefan cel Mare" University of Suceava, Romania occupies the leader position at inventions and licenses for Romania according to data recorded by the Official Intellectual Property Bulletins published by OSIM (2017) (available at <http://www.usv.ro/index.php/ro/17/Proiecte/20/4>). Considering together the significant gaps between theory and practice in the field we argue that there is a strong need for academic leadership and for a new vision in order for our universities to become 'learning organizations' which actually means 'knowledge-intensive organizations'.

The widely acknowledged and applied building blocks (Senge, 1999) – have to be re-designed accordingly to each organization, depending on its resources, structure, and potential, as IC and more – and in accordance to its goals, mission, and vision. Limitations of current research works mainly reside in the linear way of thinking which limits the systemic comprehension (as a functional and interdependent whole) promoted also by Senge and other followers. Bratianu (2017) is the Romanian author who widely promoted through his works a superior conceptual approach as the non-linear thinking

models which generate a dynamic type of thinking. We consider it is essential as the non-linear thinking should be used by the university leadership and by university practitioners in order to build a strong organizational culture that ensures development by itself. We don't say that some approaches are wrong and others are right but from our point of view and researching the most prestigious publications and authors - our conclusions converge towards a certain type of approach -that we choose to promote.

University agenda for developing students' skills in the knowledge economy

Related to universities in the knowledge economy, we are considering another globally topical issue which refers to aspirations which have reached the academic mainstream. The academic involvement in technology transfer, firm formation, and regional development represent a step closer to the academic ideal which is the entrepreneurial university. The more the universities become entrepreneurial, the more the chances for tensions between the old (research and teaching) and the new (entrepreneurial) are intensifying (Curtin, 2004; Dawe, 2004; Etzkowitz, 2013; Gibbons-Wood & Lange, 2000).

It is a fact that entrepreneurship education has gained very much interest but despite this successful proliferation remains the question about the real mission of such education programs whether they are meant to provide specialization of students in entrepreneurship, to increase the number of start-ups after graduation, or to facilitate students to acquire the necessary skills, attitude, and behavior necessary to face the competitive environment and to become future entrepreneurs? For these purposes, the actors which drive the learning are either academic teachers, working in higher education institutions, or practitioners, as businessman, managers or real entrepreneurs (Bedwell et al., 2014; Bejinaru, 2011; Davenport & Prusak, 2000).

The necessary set of skills for business success in the knowledge economy can be widely discussed but we shall refer to the top 10 priorities. It is impossible to know for sure which these employability skills will exactly be but from public debates, data and analysis published by European governmental authorities and many other interested authorities and researchers we are able to estimate a few (Bakhshi, 2016; Bedwell, 2017; Choudaha & Van Rest, 2018; Laurillard, & Kennedy, 2017; Powell & Snellman, 2004; Störmer et al., 2014; Zemsky & Shaman, 2017).

Thinking forward we can comment the estimations based on previous happenings and logic deduction. We will further present the categories of skills that we identified as common for the two decades 2020 and 2030 (Table 1). The categories of skills foreseen to be required for both 2020 and 2030 on a global scale on the labor market are *complex-problem solving skills, critical thinking skills, originality skills, active learning skills and judgment and decision making*. These categories have been already debated in a couple of papers (Bratianu & Vatamanescu, 2017; Dawe, 2004; Volkmann, 2004). According to the literature review, we can state that these categories of skills serve a certain type of objectives which are the most popular in a specific time period and context. These five types of skills are necessary for accomplishing tasks like analyzing and deciding the causes of a given problem; generating multiple solutions which will lead to achieving the planned objectives; efficient deliberating for the final solution; complete and effective implementation of plans. For example, good skills of critical thinking will enable the individual to take the best decision when confronted with several options regarding a

certain problem. Originality skills are very useful for business decision-makers because they can achieve novel and unique solutions for certain yet unknown problems which will give them a competitive advantage. Based on active learning skills the processes of adaptation, innovation, and teamwork are easier developed. Due to the complexity of nowadays working environment and multiple factors involved there are required good skills of judgment and decision making.

Table 1. Top 10 skills for 2030
(Source: Observatory of Educational Innovation)

1. Fluency of ideas
2. Judgment and decision making
3. Originality
4. Active learning
5. System evaluation
6. Learning strategies
7. Complex problem solving
8. Critical thinking
9. System analysis
10. Deductive reasoning

Following we shall analyze the new entries, which are: *fluency of ideas*, *system evaluation*, *learning strategies*, *system analysis*, and *deductive reasoning*. *Fluency of ideas* it is a new type of requested skill due to the speed of today environment. Actually the 'fluency of ideas' is rather considered an ability to generate very quickly a great number of ideas regarding a certain topic. The bigger the number of options the better the ability is considered regardless of their consistency, quality, or originality. The fluency of ideas is possible through lateral thinking and represents the cornerstone for creativity and complex problem-solving. Thus, educators must stimulate students to exercise this skill, mainly throughout brainstorming, because will ensure in the future the facile evaluation of a problem and fast generation of alternative solutions which is actually critical due to the continuously changing scenarios inside and outside the organization. Having skills of *systems evaluation* means to identify the necessary instruments of measurement or indicators of system performance and to propose the actions needed to improve and adjust performance, taking into consideration the objectives of the system. It is rather a white collar type of skills. Next, the skill of *learning strategies* refers to selecting and implementing the appropriate methods and procedures for a self-education process of teaching and learning new contents or activities. Actually, this skill refers to the self-implementing of three learning strategies: intrinsic and extrinsic reflection, seeking help from others and trial and error. In order for students to develop this skill, educators should teach students the mechanism of thinking, the reflection process and problem-solving. In this sense, must be provided a comfortable environment for students to freely express themselves and to receive feedback. Further, we have *system analysis* which represents the skill of coordinating the operations within the systems in order to correspond to the desired outcomes. System analysis skill ensures the necessary supervision of work and the realization of needed changes for the purpose of achieving the scheduled objectives. Last, but not least, *deductive reasoning* is the ability to apply general rules to very specific issues in order to obtain solutions that are suitable in the given context (Choudaha & Van Rest, 2018; Zemsky & Shaman, 2017).

Global trends and scenarios for employability skills

Worldwide surveys, research and analysis forecast, reveal and comment on the trends of the employment market and thus universities should take action in adapting to these challenges. Paying close attention to these estimations, universities must transform their mission of teaching knowledge into teaching skills, but not any skills. Individuals must adapt or even re-professionalize throughout life-long learning which will open new markets that can be developed both by existing and new players, and by public and private players alike (Bejinaru & Prelipcean, 2017).

The necessary skills for increasing employability are changing at the pace of evolutions in technology, human resources, marketing, bioeconomy, environmental sciences, medicine and other areas of great influence for the world's economy and society. In this period of fast advancements in all domains, the major dilemma is what helps graduates more in order to get employed: knowledge or skills? Closely analyzing these categories of skills proposed as priorities for 2030 we should acknowledge that the adequate combination of knowledge and skills will be the most wanted cocktail that employers seek at their potential workers. This is the main reason why universities as knowledge providers and skills' shapers should be the first interested in the evolution and requirements of the labor market in terms of graduates' employability. In this sense, there are other parties which should pay attention to the evolution of jobs like parents, schools, and governments. Even if the major fear about future jobs is that of digitalization, when robots will replace the human work, historically we can observe that industrial automation has created more jobs, growth and prosperity and not involution nor destruction. Thus, historically speaking we should trust and embrace the advancements in all areas of life. Nowadays students will be the decision makers in the labor market in 2030 and by thinking strategically about the future we can prepare them to face yet unknown challenges. Presently the focus of the education sector should be on providing that knowledge and those skills necessary to bridge together and to generate new competencies for the forthcoming workers (Bakhshi et al., 2017; Choudaha & Van Rest, 2018; Zemsky & Shaman, 2017).

For sure that people, ask so much from the future and thus the combination of our aspirations results in huge challenges that we will work our way through implying the acquiring of new skills which are triggering more stress and restlessness. However, we should count also on the innate ability of human adaptation. In order to achieve delivering these categories of skills for their graduates, universities should "focus on development of key skills and attributes that will be at a premium in future, including resilience, adaptability, resourcefulness, enterprise, cognitive skills (such as problem-solving), and the core business skills for project-based employment" (Störmer et al., 2014).

In Figure 1, are reflected 4 scenarios for the future with possible disruptions for the trends regarding UK jobs and employees' skills. The figure is extracted from the report entitled "The Future of Work: Jobs and Skills in 2030" elaborated by the UK Commission for Employment and Skills in 2014. Within this report are previewed and debated four possible scenarios for the upcoming future – the year 2030 – and for each are emphasized the eventual implications. Throughout the report are suggested potential strategies and actions that employers and individuals might implement in order to get ready for tomorrow's world of work. These new skills were brought to the fore by a

UKCES report (Störmer et al., 2014) and are proposed with the amendment that they must be adapted to the major global trends like demographics, urbanization, globalization, inequality, political uncertainty and climate change. The first scenario called 'The Great Divide' focuses on the disruptive developments. This implies that even if the world experiences great technological and industrial advancements, it is increasing the division of two socio-economic layers which are called the "haves" and "have not". The foreseen situation is that the difference between regions with high and low-income levels and offerings will be obvious. The critical issue will be faced by low-skilled labor force in any domains. In this sense, employers will recur to searching their recruits globally and job tasks will be increasingly developed online via virtual collaboration platforms. The second scenario, called 'Skills Activism' is fueled also by disruptive developments. As previously mentioned, technological innovations bring large-scale automation which will lead to a massive crisis for white-collar jobs. At this point, the government intervention will be necessary throughout programs of skills-conversion. The third scenario generated by disruptive developments refers to the phenomena of 'Innovation Adaptation'. Once more the insertion of high-level technology will make the competition between companies tougher and in order to survive business owners will reduce the number of employees and will invest more in technological endowments. The fourth scenario is generated by the 'business-as-usual' trend which means a 'greater business flexibility and incremental innovation leading to modest growth in the economy - but this flexibility often results in less opportunity and weakened job security for the low skilled. At this point market volatility drives increased flexibility in work arrangements, and temporary or zero-hour employment contracts are the rule in many organizations' (Störmer et al., 2014, p.xv).

University strategies for providing future skills

Nowadays universities are facing a critical position in the perspective of their stakeholders, whose demands are increasing at the pace of global competition. In this sense, universities must know the profile of their stakeholders because they must comply with global trends, specific requirements of beneficiaries and a certain level of standards (Sin et al., 2016). Universities in emerging countries have a growing interest in raising research and education performance, while the top universities in the world are making efforts to maintain their level and even rise within the global rankings (Wang et al., 2012; Zack, 1999).

Stefan cel Mare University of Suceava is focusing efforts towards strategies for developing its research and education infrastructure, towards building strong and fruitful networks for collaborations with national and international organizations, towards providing educational opportunities for domestic (Romania citizens) and foreign students, towards facilitating career achievement for its personnel. The university leaders have made great advancements towards attracting investments and international funds for implementing complex research projects in several domains: economics, business administration, electrical and mechanical engineering, computer science, food engineering and forestry. We consider relevant to present a couple of the major strategies that the University leaders are undertaken throughout the implementation of complex R&D projects.

The strategy for increasing the capacity of research is developed throughout MANSID, which is the largest project in the university's history, having granted a sum of 6.7 million euro. The overall objective of the project is to increase the multidisciplinary and interdisciplinary Research & Development (R&D) capacity through the development of specific infrastructure and the attraction of young researchers and highly qualified specialists both to the University and to firms with research and development departments in the North-East of Romania. The investment aimed at meeting this strategic objective is the creation of a new R&D infrastructure entitled "Integrated Research, Development and Innovation Center for Advanced Materials, Nanotechnologies and Distributed Manufacturing and Control Systems" (MANSID), comprising 11 research laboratories, equipped throughout this project with more than 130 R&D equipment, out of which 21 pieces of equipment are worth over 100,000 euros.

A strategic approach of the business and social dimensions is being realized by the University under the aegis of the project ANTUR, A Start for Entrepreneurship - Increase Employment in the Urban Area. The project's general objective is 'supporting entrepreneurship and improving entrepreneurial skills at the regional level as a factor for encouraging new business development and employment growth in the North-East Region. Through this project, 37 new non-agricultural businesses will be set up in the North-East Region, in both creative and classical fields, at least 2 in each county of the region and will result in an occupancy increase of at least 74 employees'. ANTUR project has a budget of 1.8 million euro and will develop during a period of 3 years. Considering the entrepreneurial initiatives, the University manages a business incubator – *INCUBAF*, where students have the opportunity of learning the experience of starting their own business benefiting of experts' consultancy.

SOCERT, Knowledge Society, Dynamism through Research had the general objective to improve doctoral and postdoctoral research programs by supporting collaboration between universities and research institutes as well as developing human resources in research, in particular by providing financial support to doctoral students and postdoctoral researchers to increase motivation for developing a career in research and ensuring career debuting, including by participating in mixed teams (doctoral students, postdoctoral researchers). The project will generate a positive long-term effect through the selection of doctoral students and postdoctoral researchers based on specific criteria related to the relevance of the research theme, financial support, and intensive monitoring during the implementation period on strengthening the scientific publishing capacity, diversification of training and development cooperation and transnational mobility.

The successful implementation of these projects is providing the necessary framework for advancing research, for increasing the number of innovations, for improving the quality of services offered to students, for increasing staff opportunities of research and networking, for extending the university's visibility, for building teaching and research infrastructure and more. In the recent years, "Stefan cel Mare" University of Suceava has raised in international rankings like the SCImago Institutions Rankings (SIR) that "is a classification of academic and research-related institutions ranked by a composite indicator that combines three different sets of indicators based on research performance, innovation outputs and societal impact measured by their web visibility" (available at <https://www.scimagoir.com/methodology.php>). These are only a few of the initiatives developed by Stefan cel Mare University of Suceava in order to improve in the strategically important directions. The projected strategies emphasize even greater aspirations for the future, like growing the internationalization, developing more the entrepreneurial capabilities of the university, increasing the quality of education and research and finally rising the prestige of the university.

Conclusions

The main purpose was to search for the most significant factors and conditions able to influence universities in developing as learning organizations and to discuss their opportunity in the context of the knowledge economy. In more detail, we approached the top ten skills required for the next decade -2030 in the business sector and not only. The network between the labor market and the education market is supported by the skills matching, the ones that are searched for add the ones that are offered. The bottom line is that universities have no choice but to acknowledge, accept and adapt to market needs. At this moment, it is universities 'job' to provide for the outside stakeholders and in this sense, they need to know which are the new necessary skills, to understand what are these skills useful for, how will be these skills performed in order to prepare their students accordingly. Within the paper, we discussed these categories of skills, which are totally different from those of years 2000, and to explain the causes and the effects that will be generated within the global market. Further, we considered relevant, as a study case, to present a couple of strategies developed and implemented by Stefan cel Mare University of Suceava.

As a vector of nowadays society, education contributes to the development of social and economic domains which in turn contribute to raising the life-level of the individual. Nowadays, universities should switch from creating adaptation knowledge to produce

generative knowledge, and to become learning organizations. Institutionally speaking there must be created at least a basic impact of acknowledging the actual state of universities' evolution towards the pattern of a learning organization which should be viewed as a strategic road.

Although the global competition between universities can be stressful for the institutions involved, for the states and economies they belong to, we must promote the idea that from this competition philosophy everyone has to win. Thanks to this competition, partnerships are realized, opportunities are created, knowledge is enriched and research and activity fields are expanded. Unlike other organizations that break into the competition chaos, universities retain their mission of serving the world's hopes: to solve cross-border challenges; to unlock and harness new knowledge, and to build cultural and political cooperation.

13 Universitatii, 720229, Suceava, Romania
ruxandrabejinaru@yahoo.com

Abstract: *Within this paper, we will conceptually approach the influence that knowledge dynamics processes have upon the intellectual capital at the organizational level. In order to achieve our scientific goal, we gradually present and discuss what we consider to be key issues for the research topic. First of all, we present our perspective on the complexity of the knowledge dynamics concept and explain why and how knowledge dynamics must be approached differently in order to obtain individual and organizational performance. For an organization is of fundamental importance to have a clear perspective on the types of existing knowledge. Correct identification of knowledge according to various criteria helps to manage them effectively and therefore contributes to the successful achievement of organizational objectives. Throughout another section of this paper, we argue that knowledge dynamics represents multiple transfers through different processes of which the best known are: socialization, externalization, internalization, combination. These processes are possible due to the existence of two forms of knowledge as tacit knowledge and explicit knowledge. Intellectual capital and knowledge dynamics are largely debated concepts and the global evolution provides continuously new issues for discussion due to their dynamic nature. The intellectual capital of an organization is a complex structure, a very dynamic component and an endless source of innovation and development if it is appropriately capitalized. Therefore, we underline the interdependences of knowledge dynamics processes and intellectual capital components within the organization. Finally, throughout this paper, we will approach in depth important issues about the influence of knowledge dynamics processes and intellectual capital at the organizational level.*

Keywords: *knowledge dynamics, intellectual capital, strategic thinking, organizational integrators*

Introducing the key processes of organizational knowledge dynamics

Following several decades of complex exploration and exceptional confrontations, there is a general acknowledgment and accommodation towards the dynamic nature of knowledge – all through the phenomenon of knowledge dynamics. As knowledge is dynamic by its nature we may say that it can move in the same shape however between various receptors. Additionally, knowledge can be changed progressively taking another form. The same information can exist in various structures of various individuals. With respect to its nature, knowledge has been alluded to as article or process, however next to this, scientists have examined around a few different angles like the setting of information, climate social, organizational or individual and even about its confinement be it the human mind, programs, information bases, or symbols (Bratianu, 2008; Bejinaru et al., 2011).

The most important papers on this subject speak in similar terms about the dimensions of knowledge dynamics. "Opposite of individual knowledge is the organizational knowledge that is very dynamic: upon they work a variety of forces" (Davenport & Prusak, 2000, p.25). Knowledge dynamics means knowledge transformation from one form to another form in terms of specific principles. The changes may occur both at the level of tacit knowledge and explicit knowledge, which can be continuously transformed from one form of knowledge to another. Considering all perspectives, the knowledge dynamics represents multiple transfers through different processes of which the best known are: socialization, externalization, internalization, combination. Transforming information into knowledge occurs when individuals: compare and integrate new information with existing one, imagine the consequences of their decisions and actions; share and analyze their ideas with others. Nonaka and Takeuchi have undergone complex research and found out that employees of Japanese companies have the ability to convert tacit knowledge into explicit knowledge through a dynamic process of human interaction. Based on their findings, they gave meaning and content to the concept of knowledge dynamics (Nonaka, 1994; Nonaka & Takeuchi, 1995).

The SECI model relies on the theory of organizational resources according to which the tangible resources were replaced by the intangible resources and the tangible processes were replaced by the intangible processes. Any organization owns both types of resources and *knowledge* represents the complementary component of the tangible resources dynamics. Thus knowledge management has the role of a link between operational management and strategic management. The level of focus upon the knowledge dynamics within the organization depends greatly on the managerial vision with regard to the development and enrichment of the organizational knowledge platform (Boh, 2007; Hansen, 1999; Hill, 2008; Lam, 2000). The leadership vision is the one which targets on the creation of necessary knowledge in order to complete the organizational resources in a long run (Bratianu, 2017).

A new perspective upon the intellectual capital components

In the current knowledge-based economy, Intellectual Capital (IC) has been seen as the key element for a competitive business. Intellectual capital is a company's asset such as professional experience, skills, knowledge, organizational structure, and routine and internal/external relationship. The most common intellectual capital framework classified these characteristics into human capital, organizational or structural capital and relational or customer capital (Mazzota & Bronzetti, 2013; Schiuma & Lerro, 2010; Edvisson & Malone, 1997; Spender, 1996; Spender & Grant, 1996; Stewart, 1997).

In this approach, human capital represents the overall knowledge, generally in tacit form, of all persons working within an organization. This knowledge does not remain in the organization when the individuals go out. Human capital consists of knowledge, skills, and experience of employees and managers. It is a kind of capital, which is not the property of the firm, so the company needs to enforce the link with its workers as well as needing to find ways to transform the tacit knowledge into structured knowledge (Bratianu & Vatamanescu, 2017).

The structural capital is represented by institutionalized knowledge and codified experience stored in the database, routines, patent, and manual. Whereas human capital is possessed by the employees, structural capital is controlled, possessed and managed

by the firm. In this sense, structural capital can be seen as the skeleton and the glue of an organization because it provides the tools and architecture for retaining, packaging, reinforcing, and transferring knowledge along the business activities. Finally, structural capital, consist of the stock of knowledge that stays in the organizations in form of tacit and explicit knowledge, that is contained in documents, routines and organizational culture. In another word, structural capital is a firm's supportive structures for knowledge creation and deployment as well as the set of knowledge, skills, and abilities embedded in the organizational structure (Mazzota & Bronzetti, 2013; Bontis, 1999; Stewart, 1997).

Furthermore, human capital is a fundamental component due to its endless generation of innovation as well as its impressive adaptation to the organization's needs. Human capital may be rebuilding at a greater speed then structural and customer capital, which need more time to reach a convenient estate. However, in order for the human capital to instantaneously bounce from one stage to another, pushing forward its evolution there has to be an appointed knowledge dynamic (Bejinaru & Iordache, 2011).

Relational capital, mainly tacit knowledge, it is understood as all knowledge arising from the interaction between the firm and its stakeholders. Relational capital reflects the organizational value that emerges not only from a firm's relations and connections with customers, but also with current and potential suppliers, shareholders, other agents, and the society in general (Ordoñez de Pablos, 2005). The relational capital is the source of the reputation, credibility, consent, and image of the organization (Leon, Pinzaru & Zbucnea, 2015). The relational capital consists of knowledge resources derived from networks of relationships between peer, customers, suppliers, and business associates. These three new forms of capital capture a company in movement as it transforms its skills and knowledge into competitiveness. Therefore, the company needs to keep up and develop the existing capital structure and also acquire know-how, skills and professionalism, train and develop employees by emphasizing their business skills and capital to focus on trading and customer (Tennyson et. al., 2013).

When related to intellectual capital, knowledge has to distinguish through its value for the organization. Knowledge actively generates value, only throughout its use. The greater the knowledge dynamics is the greater impact of intellectual capital value. Knowledge creates value by incorporating it into the company's products. Knowledge dynamics significantly influences the company's capacity of producing and delivering valuable economic products to clients. Incorporating knowledge into the organization it will lead to valuable outputs which not only that enclose knowledge but also were the result of previously well-processed knowledge (Bratianu, 2018).

The research was undertaken in domains like knowledge management, IC and learning organization obviously emphasize the actual estate of disciplines in the context of organizational change. Each of these disciplines represents the need to shape the employee's knowledge as a must for the survival in the present business environment. Out of the whole picture, the researcher will construct the cause-effect relationship between the organization and its knowledge dynamics (Bejinaru & Iordache, 2010).

Intellectual capital comprises both human capital and structural capital for the purpose of using their synergy in order to increase the organization's growth. The company's value depends and also comprises the entire value of workers, together with the

company structure. Actually “the intellectual capital develops the company values and optimizes the company business operations”. (Davenport & Prusak, 2000) Intellectual capital implies human resources, information technology, business strategy, and employees’ participation in order to rapidly transfer the imperative experiences across the company. For individuals to share knowledge within the company, the management has to facilitate the dynamics of knowledge among employees, enabling them to become knowledge workers. The company has to put at disposal of members the available information, to provide communication and to train everyone to use the information and technology the company possesses (Hunter, 2002).

Discussing the intellectual capital dynamics means to have an integrative view of the following aspects. Competences include knowledge and practical abilities on which they base. The attitude refers to the employee volition of using his/her knowledge and abilities to serve the organization’s interest and he/she may be influenced by motivation and behavior. Intelligence refers to the employee’s capacity to use knowledge and abilities in various contexts and in order to increase knowledge and competences throughout learning. Relating capacity represents the individual ability to establish relations with others -clients, suppliers, business partners, and other stakeholders. The innovation and development rate comprises the intangible aspects that may improve the intellectual capital, all the ‘elements’ that were built or conceived and that will have an impact upon the future value of the organization’s intellectual capital.

The nature of the organization is to manage valuable knowledge only for itself and the individuals inside. The individuals’ nature is to adapt their work –of creating knowledge –to the organization’s requirements and also resources. The intellectual capital existing inside the organization generates that organization’s values, knowledge, and intelligence. The output of values, knowledge, and intelligence depends greatly on the input. The organization’s intellectual capital is built with the aid of human elements and structural elements.

The existence of knowledge dynamics serves as an organizational competence that helps in creating the intellectual capital at the necessary level that might increase the organization’s performance. The link between intellectual capital and knowledge dynamics at the individual level may be reduced to a person’s motivation to increase his/her participation in such a way to contribute to building an organization oriented towards learning. On the organizational level we picture the dynamic processes on the vertical axis contributing to transforming individuals’ assets into organizational, and on the horizontal axis, they reflect the progressive knowledge transformation into action (Bratianu, 2008; Bejinaru et al., 2011).

The influences of knowledge dynamics and intellectual capital

A knowledge-based perspective sees the organization as a repository of knowledge resources and capabilities. Throughout the perspective of intellectual capital, the organization’s knowledge dowry includes the expertise and experience of individuals, the routines and processes that define the distinctive way of doing things inside the organization, as well as the knowledge of customer needs and supplier strengths. To the extent that the knowledge and capabilities are unique and difficult to imitate, they confer a sustainable competitive advantage for the organization. Knowledge is cumulative, so the more the organization knows the more that it can apply what it knows to new areas

of opportunity and increase its returns. The primary rationale of organizations is thus the creation and deployment of knowledge. Performance differences between organizations are a result of their different stocks of knowledge and their differing capabilities in developing and deploying knowledge. Knowledge and competence have become the primary drivers of competitive advantage in advanced nations (Choo et al., 2001).

The field of intellectual capital poses special challenges because is conceptualized from numerous disciplines resulting in a mosaic of perspectives. Thus, accountants are interested in how to measure it on the balance sheet; information technologists want to codify it in systems; sociologists want to balance power with it; psychologists want to develop minds because of it; human resource managers want to calculate a return on it; and training and development officers want to make sure that they can build it (Choo et al., 2001).

The idea of intellectual capital surfaced from the dialogue between researchers and practitioners seeking a more complete representation of the visible and invisible assets and processes that constitute a firm's capacity to create value (Bontis, 1999). Conceptually intellectual capital consists of human capital and structural capital. Human capital is a function of the competence, intellectual agility, and attitudes of the organization's members. Structural capital refers to the learning and knowledge that is enacted in processes (process capital); knowledge that is codified as documents, objects, and intellectual property (intellectual assets); and the reputation and relationships the organization has developed over time with customers and partners (relationship capital). The dynamic perspective is opposite to the operational structure based on the static model of intellectual capital which has been developed from the practical need of measuring the contribution of intangible assets to the market value of a given company. In this perspective, intellectual capital is considered to be the sum of everything everybody in a company knows that gives it a competitive advantage (Bratianu, 2008).

Roos et al. (1998) observe the distinction between intellectual capital (IC) and organizational knowledge as follows: "While knowledge is a part of the intellectual capital, IC is much more than just knowledge. Brands and trademarks, as well as the management of relations with external parties (trade distributors, allies, customers, local communities, stakeholders in general and the like), are all dimensions of value creation." The strategic management of intellectual capital is not only concerned with the identification and measurement of stocks of organizational knowledge, but also with the control and alignment of flows of knowledge (knowledge dynamics) across organizational levels in order to enhance performance. Thus we must state that the interdependences of knowledge dynamics processes and intellectual capital are obviously continuous, strong and rapidly changing (Prelicean & Bejinaru, 2016).

Several authors (Ordóñez de Pablos, 2003; Roos et al. 1998; Bontis, 1999; Pöyhönen & Smedlund, 2004) have noted that most studies tend to view intellectual capital merely from a static point of view, whereas in order to understand how organizations use intellectual capital for value creation, a more dynamic approach is required (Kianto, 2007). In figure 4 we show that human capital can be structured into three independent entities: knowledge, intelligence and values.

Figure 1. Operational structure of the human capital
(Source: adapted after Bratianu, 2011)

Knowledge contains both tacit and explicit components which are generated at the individual level and afterward developed (due to their ontological dimension) at the group level and organizational level. Intelligence is considered in its multiple frames as the capacity of processing knowledge accordingly to a certain human dimension. The greater this capacity is the more will grow the IC. Values are considered here in the cultural framework of a given society. Values represent the most inner part of an organizational culture that guides the decision making process. At an organizational level, the values reflect traditions, symbols, rituals and other ingredients of organizational culture (Bratianu & Orzea, 2013; Davenport & Prusak, 2000; Edvinsson & Malone, 1997).

If we agree that human capital at the individual level can be structured into these three categories, then it is easy to demonstrate the fact that these categories can be identified in the structural capital and relational capital as well. That means that measuring intellectual capital as a sum of human capital, structural capital and relational capital is misleading since we can measure some entities twice or even three times. Human capital, structural capital and relational capital are not independent entities from their content point of view. On the other hand, knowledge, intelligence and values are independent entities and can be considered as building blocks of the organizational intellectual capital (Bratianu, 2011; Bratianu & Bejinaru, 2016, 2017).

Organizational experience demonstrates every day that knowledge is in a continuous transformation process at both individual and organizational levels. Performing a literature search and analysis, Kianto (2007) considers that there are three main dynamic interpretations for intellectual capital: a) value creation dynamic; b) organizational activities and c) change capabilities. (Bratianu, 2011) The first dimension shows how different resources interact to create value for the organization. That means that two companies having almost the same tangible and intangible resources may have different intellectual capital potentials due to the different ways these resources interact and combine together as a result of managerial capabilities.

The second dimension signifies the importance of all activities through which knowledge is generated, acquired, disseminated and used effectively in the organization.

It is not important how much knowledge one organization has got, but how much it is able to process effectively. For instance, there is an interesting learning paradox about universities, which are considered as knowledge-intensive organizations. The paradox may be formulated as follows: although a university is an organization based on learning processes, it is not necessarily a learning organization. It can become a learning organization if and only if there is at least a strong *integrator* to assure the transition from individual learning to the team and organizational learning (Bratianu, 2008).

The third dimension of intellectual capital focuses on organizational capabilities for generating and managing change. This change is necessary for continuous adaptation of organization to the turbulent external business environment. Innovation, learning, and renewal are the major topics related to this third dynamic dimension of intellectual capital (Kianto, 2007; Roos et al., 1998). Although these three dimensions are associated to the dynamic nature of IC, the basic structure of the organizational intellectual capital does not change, which is a severe limitation in understanding and evaluating the potential of intellectual capital (Bratianu, 2011; Franz, 2010).

Figure 1. Dynamic structure of the Intellectual Capital
(Source: adapted after Bratianu, 2011)

The potential of the IC's components may be entirely revealed and used through the organizational mechanisms that are called –integrators. Integrators- have the power to bring together the primary constituents, and to integrate them into the final intellectual capital of the whole organization making use of synergy, as in a system designing process (Bejinaru, 2016; 2017). We have already mentioned that the static model of intellectual capital has many limitations and vulnerabilities as the three main components of intellectual capital are not independent entities. At this point, Bratianu (2011) demonstrates that when measuring the organizational intellectual capital there are several elements that will be quantified more than once, maybe two, three or four times. Bratianu (2011) shows that each main component of the intellectual capital may be divided into three distinct/independent entities: knowledge, intelligence, and values. According to the new perspectives presented about intellectual capital and considering the dynamic nature of its components, we promote the new dynamic structure of the intellectual capital as designed in figure 5.

Within our figure 5, you can observe twice the term “intelligence” as it once relates to the individual and then to the group/company. The bottom line of this figure is that the circuit has logic and obviously shows the dynamics of intellectual capital within the organization. The represented process is continuous and each time its “loop” is different as all components are dynamic and change their proportions. The dynamics of human elements is irreversible and unstoppable as individuals learn either through training (if provided) or through practicing and experiencing; the dynamics of the structural elements is the consequence of humans’ entrepreneurship. The nature of humans is to change everything around in order to suit their interests and this is why humans learned in time to get things moving.

Conclusions

As we systematically argued in each of our sections intellectual capital has been debated by many, defined by some, understood by a select few, and formally valued by practically no one. The great challenge for business leaders is to discover the magic equation that shows how to increase the intellectual capital of the organization and thus obtain greater revenues.

The dynamic understanding of intellectual capital provides insights for managers. Instead of viewing the management of intellectual capital as controlling the stock of codified knowledge resources possessed by the organization at present, the dynamic approach directs attention to the future-oriented management of flows and the facilitation of knowledge sharing, learning, and innovation. More specifically, the value-creation-process view emphasizes that managers should be highly aware of how intangible resources influence value creation and what kinds of synergies there are between different types of resources.

When related to intellectual capital, knowledge has to distinguish through its value for the organization. Knowledge actively generates value, only throughout its use. The greater the knowledge dynamics is the greater impact of intellectual capital value. Knowledge creates value by incorporating it into the company's products. Knowledge dynamics significantly influences the company's capacity of producing and delivering valuable economic products to clients. Incorporating knowledge into the organization it

will lead to valuable outputs which not only that enclose knowledge but also were the result of previously well-processed knowledge (Bejinaru & Prelipcean, 2017).

Furthermore, human capital is a fundamental component due to its endless generation of innovation as well as its impressive adaptation to the organization's needs. Human capital may be rebuilt on a greater speed than structural and customer capital which need more time to reach a convenient estate. However, in order for the human capital to instantaneously bounce from one stage to another, pushing forward its evolution there has to be an appointed knowledge dynamic (Bejinaru, 2011).

We conclude by reminding once again that the intellectual capital of an organization is a complex structure, a very dynamic component and an endless source of innovation and development if it is appropriately capitalized. Therefore, we underline that approaching the interdependences of knowledge dynamics processes and intellectual capital components within the organization represents a great opportunity for improving the use of organizational resources.

DOES INTELLECTUAL CAPITAL CONTRIBUTE TO A BETTER MANAGEMENT OF VIRTUAL TEAMS?

Georgiana CRISTEA

National University of Political Studies and Public Administration
30A Expoziției Blvd., 012104 Bucharest, Romania
georgiana.cristea@facultateademangement.ro

Abstract. *This paper proposes a review of the literature on two very important topics for managerial population nowadays: intellectual capital and virtual teams, with an eye towards applying the theoretical information to organizational performance and efficiency. In a knowledge-based economy, where the information is still the most important source of power, the “intangible” assets of the company (the intellectual capital, with its three forms human capital, relational capital and structural capital) are playing the main role in the creation, development and survival of the company on this very demanding and competitive market. Consequently, employees are seen not only as resources for the company, but as values creators, exchanging their knowledge and the information and using their abilities and skills within various networks. In the current economy, change is a constant for the organizations and combining this reality with the fast pace development of technology, virtual teams have become one of the most common solutions for many companies, especially for multinational ones. In order to find the most effective strategy to use the knowledge about the intellectual capital and its components in virtual teams’ management, we review books and articles from different areas like: management, sociology, organizational psychology and law, to discover all the aspects involved in this approach. We discovered that knowledge and understanding of the human and relational capital are playing a vital role for the management of virtual teams, considering the specificity of those teams.*

Keywords: *virtual teams’ (VT) management; intellectual capital (IC); relational capital; network-based capital; digitalization.*

Introduction

We assist today to a considerable digitalization of almost everything: even when we are referring to younger categories of employees, aged between 18 and 38 years, we are talking about “digital immigrants” (describing the Generation Y members) and “digital natives” (describing the Generation Z members) (Prensky, M., 2001; Twenge, J.M. & Campbell, S.M., 2008; Twenge, Campbell, Hoffman & Lance, 2010); we also have global digital marketplaces, where products from all over the world are bought and sold every second; we have digital technologies, including all types of electronic equipment and applications that use information in the form of numeric code, so we can posit that overall we have a digital economy. Most of us are making “digital” our way of living: we are online buyers and we are part of the online communities of consumers, we are doing online transactions and payments, so why wouldn’t we be remote employees? Or members of virtual teams (VT), using our abilities, competencies, knowledge and information in a digital workplace, instead of a traditional one? This new style of thinking and acting, this type of “knowledge-based economy has turned the attention of many organizations from the functional production models to more flexible, creative

and innovative ones, adapted to meet the expectations of the digital consumer” (Vătămănescu et al., 2018a).

Recent HR studies stated that classical work contracts, with a limited or undetermined period of validity will soon become history and the Harvard Business Review (2018) affirmed in a recent book that: “Virtual collaboration is fast becoming the norm”, so it is obvious that the number of digital employees will increase and these people will do a constant exchange of knowledge and information with similar peers, collaborating within online networks or communities (Vătămănescu, Nistoreanu & Mitan, 2017; Vătămănescu et al., 2018b) being part of virtual teams (Lilian, 2014) or teleworkers (Bergum, 2014) or “remote employees” (Purvanova, 2014; Bunce, Wright & Scott, 2017). Therefore, in order to react appropriately to this new certainty, new forms of intellectual capital (IC) will develop and will be on the research agenda of academics and practitioners, affirming their relevance, in this context of the digital workforce management.

Nowadays, organizational performance is increasingly a knowledge-related issue (Vătămănescu et al., 2015, 2016a, c, 2017, 2018a, b) and our research question was related to the contribution of the intellectual capital to the performance of the virtual teams. While the literature about intellectual capital (IC) focuses on intangible resources of a company that contribute to value creation (e.g. Edvinsson & Malone, 1997, Sullivan, 1998, Spender et al., 2013), typically in terms of human, structural and relational capital assets governed by an organization (e.g. Bontis, 2001; Guthrie, 2001); the latter concentrates on the activity of virtual teams, their strengths and weaknesses, the communication within these teams, the challenges of these teams, the management and leadership, and of course the performance of the virtual teams (Avolio, Kahai & Dodge, 2001; Bell & Kozlowski, 2002; Malhotra, Majchrzak & Rosen, 2007).

In order to recognize how the employees can create value for the organizations without working face-to-face or in a traditional work environment, it would be very useful to understand the relationship between these two aspects (IC and VT). At this moment, this is a great volume of research on IC and VT fields separately, but there are only few studies combining these approaches and demonstrating how IC advantages and their management might impact the value creation in virtual teams (e.g. Alavi & Tiwana, 2002; Harvey, Novicevic & Garrison, 2005; Striukova & Rayna, 2008; Suchan & Hayzak, 2001).

The intellectual capital in the organizational framework

In an environment that is more and more competitive, dynamic and knowledge-based, where the artificial intelligence intends to take over part of some standard human activities, it seems that the most valuable resources of the organizations and suitable for considering, are not anymore the ones that appear on the balance sheets, but the “intangible” ones, also known as Intellectual Capital (IC) (MERITUM, 2002) of the organizations (Subramaniam & Youndt, 2005; Teece et al., 1997). Studies have shown that intellectual capital and non-tangible assets are also important for value creation (Moustaghfir & Schiuma, 2013; Bratianu & Vătămănescu, 2017; Bratianu, 2018) and IC is information that could be converted into profit (Sullivan, 1999) and it could be a predictor of a company’s greater productivity, efficiency, and overall profitability (Berzkalne & Zelgalve, 2014).

Because of the difficulty of measuring, at the beginning, it was hard to identify the intellectual capital, to define it specifically and completely and there were different opinions on this topic. Notwithstanding it is being demonstrated that knowledge assets could lead to a company's superior performance than tangible resources (Bogner & Bansal, 2007).

Although, there is not a general consensus and a general accepted definition, so the intellectual capital was defined by the academics as: "the sum of all knowledge and knowing capabilities used to form the process of conducting business to gain competitive advantages (Subramaniam & Youndt, 2005; Youndt et al., 2004, Nahapiet & Ghoshal, 1998; Stewart & Ruckdeschel, 1998; Teece & Teece, 2000); the knowledge assets that can be converted into value (Edvinsson & Malone, 1997); the sum of a company's hidden assets not fully captured on the balance sheet (Youndt et al., 2004). Considering from an economic point of view, in 2015, intangibles represented 87% of the market capitalization of listed companies forming part of the S&P 500 stock-market index (in Cañibano, 2017) the trademarks being a large percentage of these assets and in many cases the expenditure on R&D exceeding the net profits of these companies (Cañibano, 2017).

Despite the different definitions of the IC, there is a consensus of the main components of the IC and in most papers, intellectual capital is seen to consist of three elements: human capital, structural capital and relational capital (Dean & Kretschmer, 2007; Sharabati et al., 2010; Herremans et al., 2011; Leitner et al., 2014).

The human capital refers to employees and executives, and includes the sum of employees' education, experience, competence, knowledge, skills, innovativeness, attitude, commitment, wisdom, and creativity (Guthrie, 2001; Boujelbene & Affes, 2013; Wang et al., 2014). It represents the individual knowledge stock of an organization to reach certain targets (Pablos, 2002; Nick & Alexander, 2007; Bontis et al., 2007; Cabello-Medina et al., 2011; Campbell et al., 2012). The human capital is the first dimension of the IC, because a highly skilled workforce can contribute to improve business processes, can make the company more competitive and valuable, and can contribute to the development of the company (Hitt et al., 2001; Vătămănescu et al., 2016a).

Structural capital is embedded in the entire organization, rather than in its employees (Cañibano, 2017) and it is represented by the non-tangible assets of organizational capabilities, organizational charts, organizational culture, routines, procedures, process manuals, strategies, information systems, hardware, software, databases, company images, patents, copyrights and trademarks (Bontis, 1998; Karagiannis et al., 2008; Zangouezinezhad & Moshabaki, 2009; Aramburu & Saenz, 2011). The structural capital refers to the valuable intangible assets that employees cannot take away when getting off work or leaving the organization (Edvinsson & Malone, 1997) and that help company to meet the market requirements (Pirtini, 2004).

Relational capital is the most complex dimension of the IC, because it consists in all the relationships between the internal intellectual resources and the external stakeholders (De Clercq & Sapienza, 2006; Carmeli & Azeroual, 2009; Kong & Farrell, 2010; Bronzetti et al., 2011) and it speaks about the organizations as dynamic and open systems (Vătămănescu et al., 2016a). Nowadays companies have a wide range of stakeholders:

customers, suppliers and partners they interact with (Cañibano, 2017; Vătămănescu et al., 2016c; Andrei et al., 2017). Having a strong relational capital with external actors of the organization, companies can learn from their experiences, can improve their processes and they become more innovative (Cousins et al., 2006; Dewhurst & Navarro, 2004). From an economic point of view, researchers suggested that relational capital may influence transaction costs, enhance cooperation, strengthen supplier relations, and regional production networks (Moran, 2005; Thuy & Quang, 2005; Zhang & Fung, 2006).

There are also other authors who found out by their researches different dimensions of Intellectual Capital, such as “renewal capital” referring to innovative solutions, products and services available for the firm (Kianto, 2008), “trust capital” the trust embedded in its relationships, both internal and external (Mayer et al., 1995), “entrepreneurial capital” the competence and commitment related to entrepreneurial activities in the organization (Erikson, 2002) and “network –based capital” defined as “an intricate configuration and consistent interaction among people, knowledge, information, expertise, competences, know-how within complex and dynamic online social networks” (Vătămănescu et al., 2016a).

The third dimension of the intellectual capital – relational capital - can be observed in the online environment also and there are authors speaking about “network capabilities” (Still, 2014). Online communication is recently (especially for generation Y and Z) the preferred way to communicate, to share information, beliefs and values. Internet has provided people with this freedom to communicate (Zhao et al., 2013) because in this virtual environment there are no boundaries and the time and space are more flexible concepts (Bharati et al., 2015). Considering these aspects and trends (mobility and flexibility), we can state that virtual teams respond to the needs of the young generations: to have a flexible workplace (Cristea & Mitan, 2017), with a totally adaptable schedule, communicating via technology and using the Internet, being part of greater communities of colleagues. The online preference is also related to the globalization era we are facing (Cuculeski, 2016) – nowadays the employee has the opportunity to work for an organization, even if he is not leaving his/her native country (Cascio & Shurygailo, 2003; Lilian, 2014) and the companies have access to valuable resources from all over the world, with less geographical barriers (Serrat, 2017). In the 21st century when companies face a more sophisticated consumer demand that influences the business orientation and when information influences the purchase behavior (Dawkins, 2004), virtual teams can help companies to adapt better to the local demands and to respond more quickly and appropriate to customer needs.

Virtual teams

Megatrends affect individuals and companies from all over the world and at this moment, mobility and flexibility are two megatrends (Großer & Baumöl, 2017), influencing our daily life including the way we communicate, the way we work or interact with others. Technology is constantly progressing and reinventing itself and sustained the creation and the development of these global trends. To keep up with the technology, companies that want to resist in this competitive market needs to adapt quickly to all those changes and trends, need to reconfigure their organizational strategies and reinvent themselves (Petrou, Demerouti & Schaufeli, 2018).

There are many factors that contributed to this fast development usage of the virtual teams within the companies. First, the technological advancements, we were describing above (e.g., Priem, Li & Carr, 2012): there are many technologies allowing the employees to work, communicate and collaborate with their colleagues and managers, even if they are thousands of kilometers away. There are the “classical” communication means like: phone calls, e-mails, SMS, internal chat, internal communicator, audio-conferences and video conferences (Serrat, 2017), and the newest ones: like using 3 D holograms during meeting (Bunce, Wright & Scott, 2017), or avatars or instant messaging (Bond-Barnard, Fletcher & Steyn, 2016) on different social platforms and so on (Gilson et al., 2015). Second, the preferences regarding the work-life balance of the generations newly entered on the labor field (Generation Y and Generation Z) have changed. Millennials prefer to choose where is their office and when they work, because they do not like the idea of having a standard office or a standard schedule (Cristea & Mitan, 2017), like their parents or grandparents. They do not value the idea of paid extra-hours and they do not try to impress their manager with them (as Generation X) (Hobart & Sendek, 2016), because they prefer a flexible schedule and they give importance to the higher good of their work, not to the exact hours they are working to accomplish it. And third, the cost efficiency policies of the companies that, thanks to these new technologies, can found and contract valuable talents, responding very well to their needs in underdeveloped countries where they can pay less, while obtaining the same results (Cascio & Shurygailo, 2003; Lilian, 2014). This third aspect, corroborated with the first one lead us to the idea that geographical distance is no longer a barrier when it comes to find the best people for the team.

Therefore, it is not surprising that the virtual teams study is still an important topic for the academics and managers and it became a common procedure of HR and managerial strategies (Raisinghani et al., 2010; Gilson et al., 2015), because understanding and using the right tools for virtual teams` management will be the prerogative of a well-prepared manager.

Definition of VT, advantages and disadvantages

Work in virtual teams and management of the workforce located in different places, has occurred in many situations as an alternative and a necessity of the employers who did not find local work force and they needed to find new sources of talent to accomplish company goals (Lilian, 2014). The virtual teams have been studied for almost twenty years (Jarvenpaa & Leidner, 1998; Lipnack & Stamps, 1997; Lipnack & Stamps, 2000; Gilson et al., 2015), in order to provide the managers and companies with answers to questions like: “Is this solution an efficient one? And if it is, what are the risks? What are the limitations of this solution and for how long can we use this type of work force?”. However, there is still not a general accepted definition for *Virtual Teams* or *Telework*. Academics and practitioners agree with few general characteristics of them: they are groups of people (they can be employees, collaborators of partners), geographically dispersed from the head quarter, brought together to work on a common project, and who use information technologies (ICT) to communicate (Huws, Korte & Robinson, 1990; Korte & Wynne, 1996; Bergum, 2009). As virtual teams are communicating especially through technology, which enable synchronous and asynchronous communication (Avolio & Kahai, 2001) leaders of these teams should have the ability to transmit the information in a manner that serves reaching their goals (Eissa, Fox, Webster & Kim, 2012) and this involves new managerial abilities such as: the ability to

interact on social networks, a global way of thinking, capacity to adapt to multiculturalism, and the ability to be active and online 24/7 (Trivedi & Desai, 2012).

The reasons why virtual teams are now a topic of high interest for managers and academics, were that some benefits of this working style were highlighted: easy access to talents and resources, from different countries, locations and organizations with no geographical restrictions (Serrat, 2017), where resources can be represented by valuable people, knowledge (Bunce et al., 2017) and information. The virtual teams present also some disadvantages and limitations like: the limited face-to-face communication, contextual differences, cultural differences, time differences, country specific aspects that are difficult to understand, team cohesion, trust, cooperation behavior, work satisfaction, and all these can end up with a low performance of virtual teams. Considering all these limitations, many academics studied the theoretical difference between face-to-face and virtual teams in terms of performance and work efficiency (Ortiz de Guinea, Webster & Staples, 2012; Mesmer-Magnus et al., 2011) and the conclusions were that face-to-face teams would be more performant. Although, practical studies could not support the academic findings (Malhotra, Majchrzak, Carman & Lott, 2001) and because of this lack of consensus, there are still plenty of research opportunities, based on these contradictions.

Conclusions: challenges of virtual teams and opportunities offered by the usage of the intellectual capital

Various studies demonstrated the huge impact of the leader in team's performance for collocated teams (Lilian, 2014; Bergum, 2014) and the researches carried out on virtual teams proved an even more important role of the leader for the success of this type of teams (Zaccaro & Bader, 2003; Leonard, 2011).

First, taking into consideration the needs of the employees from the generation Y or Z, the role of the manager is currently changing: the leader should be a *coach* and a *mentor* for his employees (Honore & Schofield, 2012; Miller, Hodge, Brandt & Schneider, 2013). Second, considering the opportunities and challenges of the virtuality, there are authors who stated that leadership is not only the responsibility of the hierarchical leader, but it should be shared between the team members in a collective way, delegating the power and the accountability to each member of the virtual team (Kirkman, Rosen, Tesluk & Gibson, 2004) giving birth to an important concept for virtual teams: Leader-Member-Exchange (LMX) (Gilson et al., 2015), concept that englobes aspects of the relational capital and human capital of these teams.

In this dynamic work environment, leadership fundamental concepts remain the same for virtual teams: vision, mission, direction, strategy, motivating the employees, inspiring them, creating trust within the team, but we assist to a change of paradigm and a change of the way these concepts are transmitted to the team members and after that implemented by these ones (Trivedi & Desai, 2012).

The organizations of the past had a well-defined hierarchical structure and a formal way of transmitting the information and the power from the leader to subordinates (Jarvempaa & Tanriverdi, 2003). With all the technological progress, the companies needed to adapt to new ways of working and to the demand of globalization and virtuality, consequently new organizational structures, more flat ones and web-like

were adopted (Jarvempaa & Tanriverdi, 2003), to facilitate the access to information, the flows of the processes with fewer boundaries and the exchange of the roles within the teams. Therefore, the manager of VTs should be able to use replacements of the direct leadership strategies, materialized through clear rules and procedures, specific standards and routines, respected by all the team members (leader included), in order to control the behavior of the members, to limit the negative impact of the lack of face-to-face interaction and to prevent misunderstandings (Hoch & Kozlowski, 2014), a great expression of the structural capital embedded in these teams.

Geographical distance is a reality for the virtual teams, and there were academics studying this concept from various perspectives: from an organizational perspective, Antonakis and Atwater (2002) define "leader distance" as consisting of three variables: geographical distance, perceived social distance and perceived interaction frequency, from a human geography perspective Boschma (2005) shows that the distance can be classified into five categories: geographical distance, cognitive distance, social distance, organizational distance and institutional distance. Studies conducted after 2005 (Bergum, 2014; Hoch & Kozlowski, 2014; Suh & Shin, 2010) tried to identify what type or types of distance have the biggest impact on employees in terms of their performance, their communication with the direct manager, their satisfaction with the company, the trust they invest in the company, and other organizational behavior. To face the limitations determined by the distance, members of these teams are part of working communities or networks, where they are using ICT to communicate, to interact with other team members, to share their knowledge, their abilities, their expertise and competencies, in a dynamic environment, manifestation of the network-based capital of these teams (Vătămănescu et al., 2016 a, c).

Knowledge of and familiarity with the new forms of intellectual capital can provide the managers of virtual teams with answers to questions like: "What is the best way to share the information within the team?" or "How can I transmit the objectives to the members, in order to empower them to work as a team to obtain the best results?" or "How can I be an inspiring leader for the team?", aspects that are for sure a constant preoccupation when managing virtual teams.

Future research based upon this theoretical framework would present the results of a survey-based research conducted in Romania, with virtual and collocated employees from different companies as respondents, to evaluate the opinion of the respondents regarding the collaboration and communication with their direct manager.

Abstract. *This paper concentrates on the problems about the current state of intellectual property and, especially, on the necessity of the implementation of an intellectual property policy in a comprehensive University. A case study was carried out in which such a policy was proposed, following the in-depth study on the policies of four Universities from the entire world by making a comparative analysis with the policy that WIPO (Worlds Intellectual Property Organization) has elaborated on as an example. By the work in question, it was intended to reflect the most important aspects that need to be taken into consideration when elaborating on an intellectual property policy: the objectives, purpose, possession is use of intellectual property, the involvement of students and teachers in research and in the spin-out companies, the use of the University resources and facilities, the directorship, the conflicts of interest, the revenue distribution and the procedure for assigning the intellectual property rights.*

Keywords: *policy; intellectual property; researcher; innovation; spin-out; copyright and neighboring rights; patent, technology transfer; competitiveness.*

Introduction

Intellectual property includes all rights relating to literary, artistic and scientific works, to inventions in all fields of research, and to scientific discoveries, industrial marks, trademarks, emblems, but also to all rights resulting from intellectual activity in Industry, literary or even artistry. In fact, intellectual property is included in the intangible property category, although its external manifestation may be visible, or material. For example, although a painting is a tangible object, if we are talking about the object of intellectual property in question, we refer to the creativity of the author of the painting, which obviously is inalienable. In this context, we can say that intellectual property is nothing more than a result of different human activities, independent of the use of different devices or technologies that help discover new inventions.

A real and simplistic example is the computer itself - a tool that helps to create an innovative program or application. As a holder of the intellectual property right, an individual has the legally recognized right to authorize or prohibit access to information related to his creation, as well as the possibility to decide whether other persons have the privilege to use or reproduce the creation (Țîțu & Oprean, 2015).

At present, intellectual creation is increasingly tolerant of all territorial constraints, as it naturally has an international vocation. As the product party is the primary resource in which value is created, and it has a very important status in the economic and social sphere, which leads to increased attention from both governments and universities that make major efforts to promote and protect intellectual property. In this context, universities gain a special value, as they have contributed to the development of society and the economy. In fact, a tradition has been created in which universities engage in these fields by training specialists and gaining performance, always meeting the demands of society (Al-Ali, 2003).

The motivation for choosing the theme is related to the interest of the academic researchers in this field, the importance of their visions regarding the knowledge, the operationalization and the evolution of the concepts related to the intellectual property policies developed at the university level, as well as the notification of the universities regarding their role in enhancing educational performance.

The purpose of the paper is to symbolize the use of performance as a synergistic element, proposing a solution for universities reflected in an intellectual property policy, as well as developing the topical idea of the theme, not capitalized on the area of higher education institutions. In fact, the present paper recommends a theoretical and practical approach to issues related to intellectual property and the ways to protect it reflected in the rights related to intellectual property.

The research is based on a study conducted in a comprehensive university in Romania. The comprehensive universities include Lucian Blaga University of Sibiu, University of Oradea, Transylvania University of Braşov, Valahia University of Târgovişte, Ovidius University of Constanţa, Dunarea de Jos University of Galati etc. For confidentiality reasons, the name of the studied university will not be provided.

Defining key concepts

As the paper wishes to become an informative material not only for specialists in the field but also for anyone who wants to know or deepen their knowledge of the field in question, it is absolutely necessary to review all the concepts involved, such as competitiveness, innovation, technology transfer and intellectual capital (Andriessen, 2004; Bratianu, 2010; Ricceri, 2008). At the same time, it will analyze the patent concepts, utility model, trademark, model and industrial design, geographic indication.

Competitiveness defines the ability of individuals, firms, economies or regions to stay in competitive domestic and/or international competition with the aim of gaining competitive economic benefits in a particular economic context.

Innovation illustrates the process of creation or the generation of new ideas, but also the effects of the changes they generate. One of the specific features of the SME sector, along with flexibility and market orientation, is the ability to innovate.

Technology transfer is defined by the introduction or purchase of specific technologies and equipment, as well as of research equipment and facilities, in the economic circuit, all with the aim of obtaining new or improved processes or products or products that have been requested on the market, or participate in adopting innovative behavior.

Intellectual property refers to all the creations of the mind, embodied in inventions, literary or artistic works, symbols, names or even commercially used images. In fact, intellectual property is divided into two categories:

- Industrial property including inventions, trademarks, geographical indications, designs and industrial designs;
- The copyright of literary works such as novels, poems, plays, films, musical works, artworks and architectural works. Related rights of copyright refer to the rights of performers to their work, but also to those of phonogram producers and broadcasters on their radio and television programs.

Intellectual capital is a concept perceived as a set of knowledge from an organization, this definition being comprehensive, but suffering multiple updates due to continuous accumulations of knowledge. Bratianu (2018) demonstrated that many researchers have a limited understanding of the concept of intellectual capital due to their metaphorical thinking in the conceptualization of knowledge. Thus, many evaluation models of the intellectual capital use the linearity and tangibility properties, which do not fit into the fundamental meaning of this new concept.

Patent for the invention. It offers its owner an exclusive right over an invention, be it a product or a process, which aims at introducing a new technical solution to solve a problem. The utility model protects any type of technical invention, but taking into account the fact that it is new, exceeds a limit of a simple professional skill, and it is susceptible of industrial application.

The brand is defined as a distinctive sign that highlights the idea that certain products and/or services are made or provided by a particular person or organization. In fact, the marks may consist of words, letters, figures, either alone or in combination, but may also consist of drawings, symbols, three-dimensional or sound signs, perfumes or colors, all of which are used for distinctive purposes.

Industrial designs refer to either aesthetic or ornamental appearance that characterizes an animated object. In fact, they reside in three-dimensional features, such as the shape or texture of the object, on the one hand, and two-dimensional - motifs, lines, and color - on the other hand. The geographical indication is a sign that is used for products of a fixed geographical origin, showing certain qualities or notoriety due to this place of origin. For the most part, geographical indications are based on the place of origin of the product.

Intellectual property in universities

The establishment of the action plan, agreed by universities, and by the research-development institutions, aiming at an evolution of the intellectual property culture (Hiroyuki & Roehl, 1987), as well as the creation of a national strategy, is absolutely necessary for the achievement of an economic development and a special innovative spirit. In Romania, such an action plan was developed and adopted in the Workshop "Dissemination of Intellectual Property in Universities", Bucharest, March 23, 2007, as well as at the international meeting in The Hague, December 3, 2008.

The solution for developing the culture of intellectual property in universities comes out of understanding the need for developing adequate knowledge strategies (Bratianu & Bejinaru, 2017; Bratianu & Bolisani, 2015). The sensitivity to intrusions, as well as the high qualifications of universities in the techniques, procedures, methods, and methodologies of intellectual property, prove their efficiency as entrepreneurs, which must be taken into account and generalized at the national level. The totality of behavioral and professional reactions related to the remarking of intellectual property rights, which are supported not only by the legislative system but also by other unwritten rules; compose the culture of intellectual property.

The establishment of international bodies such as the World Intellectual Property Organization (WIPO or World Intellectual Property Organization, founded in 1893 and having its headquarters in Geneva) or the World Trade Organization (WTO), established only in 1995, after many years in Geneva) was determined by the need to provide effective protection for intellectual property rights. In our country, there are only two main bodies harmonized according to the European legislation in force, namely the State Office for Inventions and Trademarks (OSIM, 1997), and the Romanian Copyright Office (ORDA, 2017). Ownership of intellectual property depends largely on the legislative and contractual situation between the donor body, the inventor of intellectual property, the employee and the nature of the intellectual property.

The role of intellectual policies in university

- Intellectual property policies have several roles with the following effects (Țîțu, 2016; Țîțu et al., 2016):
- Accountability of all parties involved in the innovation process;
- Educating future specialists in the field;
- Raising awareness of the public not only in the field of intellectual property but also the importance of its rights and its protection;
- Create a regulation that will be respected by all involved, avoiding any errors;
- Economic, social and cultural development of the country;
- Creating relationships with enterprises interested in new creations that can facilitate production processes;
- Compatibility and harmonization of the intellectual property system in Romania with the existing mechanisms at the level of the European Union;
- Attaining a level of performance demanded by the evolution of a knowledge-based society;
- Transparent cooperation between organizations involved in the protection of intellectual property;
- Building an appropriate administrative infrastructure in the field.

British Columbia University. At the University of British Columbia, in accordance with its desire to stimulate community-based research, university staff are encouraged to discuss and make public the results of research, including university research, as soon and as complete as reasonably possible, provided that this does not violate any agreement that has supported or is related to the research in question. Public disclosure of university research products may make it impossible to apply for patent protection for such products.

City University of London. Within the University of London, the University will hold all intellectual property designed and or created by individuals employed by the University by graduate or non-graduate students involved in research, and where intellectual property has been created under an agreement or contract which the ownership of the new intellectual property has accepted, in whole or in part, of the University, but also in the conditions in which the person holding the intellectual property has assigned his rights in writing to the University. Moreover, the University does not claim ownership of intellectual property created by students or graduates, before, during, or after the completion of studies.

Harvard University. The Harvard University has a long history of "work" for the benefit of the public through its research programs. Growing demand and the use of media communication, educational technology, computer programs and other approaches to conducting papers in the University often give rise to complex and ongoing challenges in terms of proper and fair use, as well as the obligations and redress associated with innovation.

Determining Property. After examining the information document, the OTD will determine whether the invention is an accepted invention or accidental invention and, in the case of an accepted invention, it is further determined with the assistance of a patent consultant who is the inventor in accordance with patent law from the United States. Harvard will have the right of ownership, and every inventor, at Harvard's request, will grant the University all of his rights and title. Ownership of an accidental invention remains with its inventor, subject to any rights that may be granted to Harvard University as required by their policy in the field.

Submission of patent applications. The OTD is solely responsible for determining whether a patent application is filed for an accepted invention. The completion of determinations may be made based on commercial potential, third-party rights obligations, or other reasons the OTD of its choice deems appropriate. The creator of an accepted invention for which patent applications are filed cooperations, without the inventor's expense, in the patenting process in all manner required by the University, the agent or its representative.

MIT University. When faculty, students, staff, visitors or other people participating in MIT programs develop Intellectual Property, using significant MIT funds or facilities, MIT will own intellectual property. If the material is not subject to a sponsored study or other agreement conferring rights on third parties, the question of whether or not significant use is made of MIT funds or facilities will be reviewed by the laboratory director or inventor's central department / Author, with a recommendation sent to the Technology Licensing Office (TLO). The Vice President for Research will make the final decision on

this issue and on any litigation or interpretation of the intellectual property policy. When the invention is described, it is assigned an internal case number and a copy of the communication is sent to the Intellectual Property Coordinator in the sponsored Program Office, examining the patents and copyrights, the terms of the applicable research agreements, and notifying sponsors in Presentations of information. In TLO, the disclosure is attributed to a technology-licensing officer who will contact the inventor to discuss the invention. A decision is then made to determine whether the transfer of technology will be most efficiently achieved by a patent application or by other legal protection. Industrial sponsors are usually granted the right to choose a technology license for which other legal protection patents are required; Specific terms are then negotiated with TLO.

University of Tokyo. When manipulating the intellectual property created at the University of Tokyo, it is important to consider various issues such as contributing to the international public in the context of rising globalization and international Japanese consolidation, competitiveness as well as that of the University of Tokyo itself. Taking into account these various objectives, University members are required to pursue the most effective means of intellectual property derived from their application and to work for the greatest possible benefit of the public. Both faculty members and the institution itself have an obligation to return to the benefits of public intellectual property derived from publicly funded work at the University of Tokyo. As a matter of principle, the University believes that providing the appropriate means to manage and enforce such intellectual property requires the University's property right. Based on this framework, the University of Tokyo will establish a system for the management and use of intellectual property derived from its intramural activities as well as for litigation involving such intellectual property.

WIPO. The Institute encourages researchers to identify the results of research with potential marketing value and to increase the reputation of the institute by bringing it to public benefit and use. The person or department designated by the institute is responsible for the protection and commercialization of the intellectual property of the institute. The inventor will be consulted at each stage of the procedure. Researchers will be required to submit in writing the publication projects containing scientific results to the head of the department before publishing them and must put in writing that, to the best of his knowledge, these papers do not contain results for which protection can be obtained, or which can be exploited in any way. Researchers, including hired students, students, and visiting researchers, are required to disclose all intellectual property to the person or department designated by the institute. Copyrights will be excluded from disclosure obligations, except for those that have been developed through the performance of sponsored research or any agreement with third parties. Since the protection and success of the commercialization of intellectual property may depend on timely and effective administration, inventors are required to disclose all intellectual property with exploitation potential as soon as they become aware of them. The disclosure must be made in writing by completing an Intellectual Property Disclosure Form, available to the person or department designated by the Institute.

Case study. Propose an intellectual property (IP) policy in a comprehensive university. SWOT analysis

As it was mentioned in the introduction, this research is based on a study conducted in a comprehensive university in Romania. For confidentiality reasons, the name of the university will not be provided. The SWOT analysis was not done in general terms, this study has parts that can be taken over by all universities.

Strengths:

- Annual organization of the "Night of Researchers" project;
- The existence of an organizational culture in the field of IP focused on the recognition of its own values;
- The comprehensive university efficiently uses IP created within it, which it treats as the primary resource that creates value;
- The main purpose of the comprehensive university is to provide IP protection;
- Origins of the comprehensive university to stimulate innovation and creativity;
- The existence of a department dedicated to the field of IP;
- Participations in the world and national exhibitions leading to the continuous development of the studied comprehensive university;
- The comprehensive university is based on procedures that manage the analysis of the files of the persons requesting the registration of IP products and objects.

Weaknesses:

- Insufficient development of a computerized database that highlights and organizes didactic and research activities;
- Insufficiency of international research programs and transversal programs;
- Insufficient number of specialized teachers;
- Inability to support specific IP courses;
- Lack of motivation for students to participate in various research activities in order to develop creativity.

Opportunities:

- Harmonization with EU normative acts and international treaties in the field;
- Existence of complex IP legislation, which our country and, implicitly, the comprehensive university has;
- The comprehensive university is a common ground between academia and business, facilitating the transfer of technology;
- Possibility to adopt the policies that the World Intellectual Property Organization has formulated for the academic environment.

Threats:

- Frequent legislative changes that may lead to a major reorientation of the scientific research activity;
- Low student participation in research activities;
- The danger of migrating specialized teachers to other sectors of activity in the country and/or abroad where they are offered other material, and more substantial advantages;
- The decrease in the interest of graduates for a teaching career.

The role of intellectual property in the studied comprehensive university

Research institutes, whether public or private, are commissioned to carry out research. The primary function of universities has traditionally been to learn. However, universities are research institutes that carry out technology transfer activities (Chapple et al., 2005; Debackere & Veugelers, 2005; Anderson, Daim & Lovoie, 2007). Thus, intellectual property is inherent in many research and learning functions at the studied comprehensive university. A successful research program can generate inventions that can be patented, as well as other forms of intellectual property. Decisions must be made taking into account the protection of these inventions and bringing them to the next level of development.

The need for an intellectual property policy at the comprehensive university

An institutional intellectual property policy applied at the comprehensive university serves three tasks:

- Recognition of intellectual property owners created;
- Provide a framework in which the institution can identify, assess, protect and monitor exactly the IP for the further development and usual marketing of a certain kind;
- Define the responsibilities, rights, and privileges of those involved.

On the other hand, without an official document regulating the ownership and use of IP rights, the involved parties would not benefit from any guidance that would guide them to make their decisions on intellectual property properly. In addition, a IP policy also contributes to:

- Promotion of scientific investigations and research;
- Encourage researchers to consider the global value and possible opportunities for any new inventions and increase the potential flow of society benefits;
- Providing legal certainty;
- Balancing various conflicts of interest;
- Providing an environment where the innovative spirit is present and those who participate can be rewarded correctly for contributions to successful development;
- Provide practical guidance and specific procedures for identifying, evaluating, protecting, managing and licensing or transferring IP.

The objectives of intellectual property policy

The studied comprehensive university is committed to ensuring that intellectual property is used for the benefit of individuals and societies. At the same time, it also engages in the widespread promotion and use of research results through appropriate means, including publications and marketing. The policy establishes the comprehensive university stance on the possession and use of intellectual property, the recognition and rewarding of IP creators, and the obligations, roles, and responsibilities of all involved.

Purpose of intellectual property policy

This policy should be applied to all properties created within the comprehensive university, as well as associated rights. At the same time, this policy can be applied to all researchers who have established relationships with the comprehensive university.

Mastery and use of intellectual property

Mastering intellectual property depends largely on the current legislative context, the contractual situation between the sponsor and the creator of intellectual property, as well as its nature. Therefore, the person designated to exercise authority on behalf of the university must ensure that the contract includes provisions that place the researcher under the sign of the policy. In this respect, students are required to sign an agreement to regulate their relationship with the university, but to link them to this policy before starting any research activity. It is the responsibility of the researcher to ensure that an agreement (hereinafter referred to as the "Research Agreement"), whose terms and conditions of cooperation are appropriate for both Contracting Parties, has been concluded with the cooperation of third parties. Taking into account the financial and intellectual contributions made available by the comprehensive university, third party involvement may become a good choice when it comes to the creation of intellectual property, as each cooperating party will have access to intellectual property rights, as well as to the distribution in the form of revenue generated by their marketing. The use of resources and facilities of the University, the Company can access all facilities and staff of the University only if the University approves this fact. At the same time, the University holds absolute control over its own resources of any kind, for which it can charge for these services preferential tariffs as part of the University's investment in the company.

Directorate and conflicts of interest

The right to appoint remove or replace a director falls entirely on the University and the Board of Directors of the Company. Thus, the members of the Intellectual Property Trading Council will normally select the director of the university. If the university director decides to leave the university, he will have to resign from the university. However, the position of director of the company may also fall on an inventor who will necessarily act in the company's interest; therefore, individuals in charge of this job must recognize potential conflicts of interest.

Sharing revenue

The comprehensive university policy provides for the distribution of any income generated by the commercial exploitation of intellectual property, depending on the contributions that each individual involved in research brings to the creation of intellectual property. Within the comprehensive university, the rector of the university is the one who has the authority to endorse all documents that have in their content elements related to the strategy, development and organization of the activity undertaken by DPPI - the comprehensive university, i.e. all those documents that will be submitted to OSIM in order to obtain protection in the field of industrial property.

All the comprehensive university structures wishing to officially register a product or object belonging to the intellectual property right have to initially address DPPI- the comprehensive university to file this file that will be submitted to OSIM for related documentary research, approval and release of IP certification documents. Therefore, when a file is filed and documents are recorded, the DPPI- the comprehensive university Secretariat has the obligation to verify that the dossier contains all the necessary documentation for sending it to the OSIM Center for verification and subsequent

registration. Under Law 544/2004, the terms of settlement and communication for the applications, requests or addresses of the case are 30 days from the date of registration with the DPPI- the comprehensive university Secretariat. All these operations carried out in respect of the registration and management of documents and files of those requesting the registration of the property and the objects of ownership are strictly confidential.

Conclusions

Intellectual property is native to every nation and marks an evolution of that world that, from a historical point of view, contributes to the progress of society. Intellectual property rights are outlined as any other kind of property rights that allow patent holders or other certificates to benefit from their own creations, all of which are enshrined in the Universal Declaration of Human Rights.

The efficiency with which a university uses intellectual property is an important factor that influences the evolution of the university's notoriety, for intellectual property is considered to be the main reward that creates value. The government, research, and education institutes, as well as the Courts of Justice, are the institutions that manage intellectual property rights and those that connect with society, with the main objectives of ensuring and guaranteeing the protection of intellectual property rights; this raises the possible barriers to development, encouraging creativity and innovation.

Harmonization with the EU normative acts and international treaties in the field is due to the complexity of the intellectual property legislation of our country and covering all related fields. Thus, it can be said that the legislation of the Euclid Union is based not only on the founding treaties, but also on the binding legal acts, and it succeeds in providing protection to all categories of rights. The main objective of the European Union is to ensure the protection of intellectual property, being a priority, because there is no progress without new ideas and knowledge.

Intellectual property rights are important for stimulating innovation and creativity, leading to a continuous evolution, both socially and economically. The economic sectors in which intellectual property rights are widely used give rise to about 39% of all economic activities in the European Union, which means that they account for up to 26% of the total number of jobs in the Union. The comprehensive university underwent a national strategy in the field of intellectual property approved by the Romanian Government through Decision no. 1424/2003, as amended and supplemented by the Decision no. 1174 / 29.09.2005, which involve the promotion of an active, performance-oriented society based on values of work, social cohesion, solidarity, and responsibility.

Our country has a legislative framework in the field of complete and complex intellectual property, legislation compatible with all EU normative acts while respecting all the treaties and conventions of the field. All activities and documentation to the DPPI- the comprehensive university department must be authorized in advance by the Rector of the University, while the department secretariat records them, being responsible for transmitting to OSIM all the documents that are subject to the recognition and certification of intellectual property rights. The time limits for the settlement of the files filed with the DPPI- the comprehensive university secretariat are subject to the legislation in force, i.e. Law 544/2004, according to which the applications are settled

within 30 days from the date of their registration at the DPPI- the comprehensive university Secretariat.

The comprehensive university is subject to a confidential policy which requires all operations and acts used in file registration and management activities to be confidential, all involved being required to maintain the confidentiality of data and information on intellectual property and related rights. Thus, through this policy, all parties involved will agree on the impossibility of transmitting the data and information they are aware of during the duration of the collaboration relationship. Failure to comply with these Confidentiality Policy clauses results in an obligation on the guilty party to pay a number of damages.

CHALLENGES FOR LEADERSHIP IN THE KNOWLEDGE ECONOMY

Camelia BĂEȘU

Ștefan cel Mare University of Suceava
13 Universitatii, 720229, Suceava, Romania
cameliabaesu@gmail.com

Abstract: *The purpose of this paper is to debate the concept of leadership considering several coordinates like the traditional and present philosophy, the past and present business environment, the former and actual type of employees and also the future perspectives. The theory and practice of leadership have a long history and yet it has much to evolve also. The discrepancies might reside in the fact that the theory builders can't be ahead of the market developments and thus is difficult to create futurist theories. Nowadays, all over the world there is much talking about leadership and the need for leaders. There is a growing interest on the impact of management, leadership and entrepreneurship practices on achieved performance. In recent years, organizations have undergone significant changes, becoming powerful and effective, with a strong desire to have intelligent leaders of emotion with vision and character. Throughout the sections of the paper we present several aspects which help the projection of a comparison between the classic paradigm of leadership and the new philosophy of leadership. Within the introduction section we refer to some of the issues which changed the perception of leadership, like emotional intelligence or leading teams. In order to emphasize what are the coordinates of leadership in today's organizations we decided to present a series of best-practices of well-known global companies which we consider as modern organizations because they are always updated and implementing the latest methods and techniques. The section about leadership of work-teams contains brief argumentation about the most well-known five stages of: training, agitation, normalization, running and discontinuing operations. At this point we discussed the effectiveness of a specific type of teams, actually the virtual teams. Following we focused the debate upon the future of organizations and which might be the upcoming challenges to be faced mainly by business companies.*

Keywords: *leadership, strategic management, teams, vision, emotional intelligence.*

Introduction

Nowadays, all over the world, there is a growing interest in the impact of management, leadership and entrepreneurship practices on achieved performance in various domains. When companies manage to perform significantly from one year to the next, they mean that all three categories of managerial practices are well developed. Managerial and entrepreneurial practices have a great impact on profitability and market share, while leadership helps develop the organization (Baesu & Bejinaru, 2013a, 2013b, 2015). Although in reality, such a three-to-one management profile is more difficult to meet, the leader's mission is to build a team to complement their competencies and develop organizational capabilities (Bejinaru & Baesu, 2013, 2015, 2017). Only with such a team, success can be achieved. Such a construction can be done by shareholders and investors, who should keep in mind that teamwork and collaboration make the difference. A valuable organizational context does not mean that

the one who is at the top makes the difference but how he manages to build the team. Involuntarily, such a construction leads to a less charismatic and more integrity-based model of leadership (Adair, 2005; Armstrong & Stephens, 2008; Zhang, Zheng & Darko, 2018).

Thus, a future leader must know to focus on building a trustworthy and efficient management team, and last but not least, to have the necessary motivation and experience to lead. In order to predict future performance, knowledge and behavior are not enough; managerial skills, technical skills, and self-refinement may be sufficient to create a picture of potential but insufficient to predict its performance. Therefore, it is considered that the most difficult issue for current organizations is choosing the leadership model that they want for their future (Bolden et al., 2011; Bratianu & Bejinaru, 2016, 2017; Goleman et al., 2008; Tracy, 2018).

In recent years, organizations have undergone significant changes, becoming powerful and effective, with a strong desire to have intelligent leaders of emotion with vision and character. Emotional intelligence as the ability to sense, understand and apply the power of emotions as a source of energy, information, creativity, trust and relationship and includes four elements: -better understanding of your own emotions; -effective management of your own emotions; -a better understanding of others; -creating better relationships with others and increasing your own image (Goleman, 2004).

Perspectives about the leadership concept were introduced by Adair (2005), who is considered to having a triple contribution to shaping this domain, which consists of the following: -was the first author to demonstrate that leadership does not necessarily imply an innate skill but can be acquired as any other quality; -helped to transform the concept of management into a broader leadership concept, with which we associate decision-making, communicate and manage time; -defined leadership as "an ensemble made up of target, team, and individual, subject to load-oriented education." Through the argumentation of these leadership missions, Adair (2005) actually updates Maslow's model of needs hierarchy and the management functions of H. Fayol. It is shown from this presentation of leadership missions that in fact, we are dealing with management processes, but with a greater emphasis on their human side. By sharing his wisdom and experience in the business field, Koestenbaum (2006) reveals a series of fundamental missions and principles that someone who wants to become an authentic leader should meet. The basic idea of his philosophy is that managers should implement the "leadership diamond model" in order to be able of embracing change and challenges in an effective manner that would lead to positive results (Bratianu & Anagnoste, 2011; Bratianu & Orzea, 2014).

Leadership of work-teams

Work teams are considered the core of the organization of the future. The most well-known model of team evolution is Tuckman's 1965 team, which involves five stages: training, agitation, normalization, running and discontinuing operations (Armstrong & Stephens, 2008). *The formation* is the stage of a considerable degree of anxiety. Thus, team members address questions that reflect an interest in the assigned roles, but especially in the nature of the leadership role and the resources that are at their fingertips. Team members search for information about other members, especially about their background and the type of task the team has to perform. It is likely that they

are curious about the team's external expectations and ask for information about the rules that will influence the working methods. In this early stage, participants can be relatively cautious about the information they disclose. Initial considerations about others will, therefore, be based on limited knowledge.

The *agitation* stage is the one that delimits the constraints that may occur between individuals and subgroups. The choices, authority and/or powers of the coordinator are targeted, and members do not accept any attempts to dominate the leadership. Members of the group question the relevance and practicability of the imposed task. Also, latent tensions surface, as individuals manifest themselves strongly advocating opposing opinions. This stage is also characterized by honesty and openness in solving divergences. The leader should encourage the settlement of misunderstandings to get the focus of all participants on common goals. They also need to create trust, set up team roles and conflict resolution strategies.

Normalization is the stage during which conflict resolution takes place and the team starts to tackle the task from the perspective of positive co-operation. Plans are drawn up and standards established. Members easily share their opinions and feelings, developing a network of mutual support. The coordinator must allow the team to assume greater responsibility for planning and processes, allowing them even some mistakes and encouraging their subsequent reflection. It is important to impose rules in line with the needs of the organization as teams can also set rules against effective functioning (for example, tolerance of lack of punctuality at work or absence at meetings).

Running stage starts when team members begin to see the results of the constructive concentration of energy on the common task. An effective work structure is set up, in which individuals feel good and start to work together more relaxed. The leader no longer has to intervene on any given day, members realizing and accepting this change. Regular review systems should be organized at this level so that the team can continue to yield and be in touch with the environment in which it operates. *Closing* the activity. At this stage, as a rule, not all teams arrive, but, over time, important members will leave the group, and the projects will be finalized or discontinued. It is important that the effects of these changes on team existence are recognized as some teams may regress at earlier stages depending on the level of maturity and the rate of change (Armstrong & Stephens, 2008).

Exceptional performance in modern organizations is achieved only if the members of the organization act as a team in the sense that: stimulate each other to learn and improve professionally; will show trust, respect and honesty to each other; promote the principles of ethics and deontology specific to their profession; cherish diversity and encourage its manifestation; will stimulate change, because what is good today, tomorrow needs to be improved; recognize the qualities and merits of others; induce the feeling of security, camaraderie and solidarity among others, according to the "everyone for one, one for all"; will ensure that the workplace, discipline, order, environment is as pleasant and conducive as possible to quality work (Mainemelis et al., 2015).

Performance appraisal is the process of estimating the results of an individual in order to identify his needs and development potential and to determine the directions and

ways in which achievements need to be improved. Assessments can also document performance decisions or salary increases associated with the contribution, usually through a calibration system. The individuals work better when they know what they have to do, how well they expect them to act and how well they did. Performance appraisal aims to ensure the dissemination of this information between managers and their team members (White, 2004).

The evaluation focuses on two aspects of performance. The first aspect refers to the results obtained in the form of "outputs" (measurable or observable results) and "effects" (the general contribution made by the individual occupying the post in achieving the objectives of the team, the department and the company). The second aspect relates to what the individual brings to his post from the point of view of knowledge, skills, and behavior. The performance assessment cycle, as illustrated in Figure 1, consists of three steps: 1. Planning: it is agreed by mutual consent what to do and how to do it. 2. Preparation: it is decided how to conduct the evaluation discussion. 3. The official evaluation discussion: the balance sheet of what was done and the way it was done during the period that leads to the preparation of a plan agreed for the next period.

*Figure 1. The performance assessment cycle
(Source: adaptation after White, 2004)*

The future of organizations

Inside an organization, it is considered that the answer to every problem encountered is management. There are situations when employees do not devote their flesh and soul to their work and when their loyalty decreases and when the growth programs in which thousands of euros are invested do not give any result (Prelipcean & Bejinaru, 2016).

When teams and whole organizations face their collective emotional reality, they begin a necessary reconsideration of common customs that create and perpetuate that reality. In fact, for leaders to reflect their emotional intelligence on their teams and organizations, they need to start looking seriously instead of concentrating first on the ideal vision. This reverses the sequence of reflection and self-discovery, as it was at an individual level (Goleman, 2008). Several studies (Barnett, 2004; Morris, 2002) show that the only problem is insufficient trust in those who lead and in some companies, there is even an organizational discrepancy between customers, employees, and leaders.

Because of incompetence and mediocrity, managers fail to create a consensus between these levels and all this results from the way managers look at their employees.

We consider that one of the most relevant differences between a company with high performances and those with lower performances lies in the functioning of the ecosystem man, organization, community, which highlights the contribution of professional life to improving the lives of others in the community. No matter what the future of today's organizations will be, the progress of the modern world cannot be seen without the concept of freedom and equality. Modern organizations have largely succeeded in balancing work, material gain and creativity (Bejinaru, 2017; Drucker, 2000; George, 2003; Hage, 1999).

Armstrong and Stephens (2008) outlined the contrasting leadership styles as charismatic or non-charismatic, autocratic or democratic, enabler or controller, and transactional or transformational. As Armstrong and Stephens (2008) explained, charismatic leaders, rely on their personality and inspirational qualities, the non-charismatic leaders, mainly rely on their know-how. Autocratic leaders also impose their decisions on others by using their positions, while the democratic leader encourages people to participate in decision making. Similarly, the leader who is an enabler inspires people with a vision of the future and empowers them to achieve goals, and the controller leader manipulates people to obtain their compliance. The transactional leader exchanges money, jobs, and security for compliance while the transformational leader motivates people to work towards greater-level objectives (Armstrong & Stephens, 2008).

Over time, specialists have analyzed the causes of failure at the top of organizations, focusing on the psychological side, referring to executives and the features of their failure or success. Also, the economic side was also considered by analyzing the economic and financial performance indicators, defining a set of methods and processes that ensure success. Among the different perspectives on the causes of failure at the top of organizations, we recall (Morris, 2002): -the inability to form and maintain a team together, arrogance, differentiation from others, desire to be at the center of attention, manipulation, and desire to please are just a few factors leading to failure; -lack of continuous improvement; when a manager thinks he is performing better than he is, his leadership potential is greatly affected. As a conclusion, it can be said that management is a process of personal development and self-knowledge. Failure stems from the inability to manage your own ego in superiority, which prevents others from affirming.

The difference between performing and mediocre organizations is given by the long-term business priorities, and building and maintaining efficient and trustworthy management teams. In other words, the difference is not given by personal skills or traits, but by the values and motivations for achieving the organizational ideal. The organization of the future is based on flexibility, it is committed to acting, adapting and changing according to the changes that take place in its environment. Flexibility must become an integral part of organizational culture. Organizations need to adapt to the requirements of the external environment and be prepared to meet all customer needs (Drucker, 2000). Specialists describe the organization of the future as an organization that teaches and promotes and pursues the development of human resources (Harrington-Mackin, 2002). For leaders to be effective in the future, it is imperative that they are perceived by the subordinates as credible. Overall, human capital can be

developed through organizational credibility. The permanent success of some companies is due largely to the culture they have. Culture is the one that influences the employee's individual performance and decisions: to stay or leave the company.

Leader or manager?

One of the questions that emerges today is: How can leaders succeed in adapting their behavior and demonstrate the flexibility they need to meet the challenges of future organizations? (Goleman, 2018) Leadership complements management does not replace it (Kotter, 2008). Most companies seek to have leaders at all organizational levels, and the recruitment and selection process is centered on leadership skills. To these two elements, namely management and leadership that ensure the success of companies, there is also added entrepreneurship that has remarkable effects on the performance of a business. The reality shows that companies that manage to achieve significant performance and sustainable organizational development currently have well-developed leadership in all three categories of practice (management, leadership, and entrepreneurship) (Reardon et al., 1998).

Nowadays, in leading organizations leaders are primarily and most of all managers. There are seven key roles of the manager, which acknowledgment can help managers become fully aware of their leadership potential (Tracy, 2018).

1. Planning is the process of accurately determining the objectives to be achieved in perspective. An efficient manager must: -write down all the things he thinks, each goal of the identified goals, and implicitly the steps to be taken to reach them; -be aware of the evolution of things, including the financial situation; -determine the true measure of planning ability for the plan to lead to the desired performance;
2. Organization: is the process of coordinating human resources to achieve the goals. A manager who meets leadership needs to: -make a list to help him implement the plan and finalize it within budget limits; -organize things identified in sequential order and priority; - accept and assign responsibilities for each identified task or activity.
3. Choosing the staff: is the process of attracting and retaining the human resource that has the necessary skills to carry out the plan and achieve the desired results. In this sense, the ability to attract and motivate performers leads to success in leadership. Therefore, a leading manager must: -select the right people, invest time and effort to make effective employment; -analyze vacancies' responsibilities in order to know exactly what additional features a person should have for the post; -to conduct effective interviews to find out relevant details about the job's previous performance and his / her greatest achievements in the professional field.
4. Delegation of tasks: is the ability to identify the right person for the right function. Therefore, a competent manager must: -analyze carefully the tasks, and think exactly the result he wants to achieve; -establish performance standards that lead to the proper performance of tasks; -choose the right person, capable of performing delegated tasks; -to clearly explain to employees what they need to do to achieve the desired results.
5. Surveillance of the execution of the tasks: is the process by which the manager can be sure that the tasks are resolved on time and within the allocated budget. A manager who has leadership qualities must: -plan the work to ensure that the most efficient resources are used; -define performance so that employees can recognize and work to achieve it; -be friendly with the staff, give them time and be respectful with them; -to manage human resources just as they would like their own contribution to be managed in the reverse situation.

6. Evaluation: consists in establishing an appropriate system of indicators for each component of the work. In this respect, the Lead Manager must: -establish numerical indicators by which the quality of the desired results can be measured; -check on a daily basis how employees are approaching the achievement of indicators that quantify individual performance; -give rewards, bonuses and promote according to the achievement of indicators defining performance.

7. Reporting: consists in constantly informing the human resource involved in achieving the objectives. Therefore an efficient manager must: -manage human resources at all levels, including relationships with superiors; -to inform all employees about the issues that define their work, to organize weekly meetings to ensure that employees are well informed; -choose a suitable means of communication; -establish an information reporting program, encourage employees to ask questions and ensure that employees understand the message correctly; -have persuasion skills and make people around him feel important. The best leaders know everything about their own companies, the competitive customers and the business environment in which they work; are deeply involved in business and know how to identify the most effective solutions that define performance (Sousa & Moco, 2017).

The manager is the most important factor in motivating an employee to have exceptional achievements. All that a manager needs to do to make it possible is to be good, modest, with proper motivation, have principles and values and have ideals to build something valuable. Therefore, all who are or will become managers must understand that people work with pleasure if there is a quality relationship with their manager and whether the organization is defined by correct rules and rules with realistic goals. All managers should be aware that the main cause of employee dissatisfaction is the "incompetent manager", mediocrity and self-confidence by showing that he is superior and arrogant. This only leads to the blocking of professional development and of self, but also of the whole organization (Yukl, 1998).

There are a lot of leadership models that emphasize different skills and competences. Leadership involves a very complex set of interpersonal, technical and intellectual skills. A leader may also need leadership training to form a wider picture of the issues on which his success depends (Drucker, 2000). The following profiles are just an attempt to break down the multiple aspects of leadership into a more basic, accessible, and easy-to-understand range of skills. These profiles can provide a starting point in the discussions with the client, indicating to the two interlocutors what leadership issues should be addressed and improved (Koestenbaum, 2006). Burns (2003) presented, on the basis of analyzes made previously by Max Weber, the difference between transactional leadership and transformational leadership. He found that if transactional leadership is represented by bureaucracy and money-making work, in contrast, transformational leadership is based on charismatic leaders and convincing by their attitude towards collaboration.

The approach proposed by Hersey (2009) shows that effective leaders are able to adapt their leadership styles. The main criterion leaders follow in adapting their style is, in this model, the maturity of the followers. This maturity is given by two criteria: the ability to accomplish the tasks and the confidence that they will succeed. This theory was formulated in 1969 and did not escape criticism, some authors questioning the clarity of the concept of maturity of subordinates. However, we must not lose sight of the fact

that the theory of the two authors opened the way for a better surprise of leadership and group relations in the act of leadership. The theory also emphasizes that the leader's sacrifice is to create favorable conditions for subordinates to increase their maturity. Following we shall provide a brief description of the four leadership styles. *Delegating style* - which allows the group to make decisions on tasks, it is a style of behavior that emphasizes both the task and the human relationships. *Participatory style* - the leader transmits ideas and makes decisions about the direction of tasks, this is a style with a low emphasis on task and a great emphasis on interpersonal relationships. *Sales agent style* - implies that the leader explains the tasks in a convincing way and supports the employees, it is a style with an important emphasis on the task and on the inter-human relations. *Ordinal (imperative) style* - involves the transmission of tasks; this is a style in which the realization of the task is important, while the less human relationships. The leader's work is to solve the complex problems and to achieve the change, influencing the specific activities (Hersey, 2009).

The leader, however valuable and experienced, cannot personally include all the activities that the organization is currently running. In fact, as the practice of leadership proves, the performance leaders are competent people, with a strong personality and proven skills, with skills and habits specific to joint work. Behind a decent man - says a Chinese proverb, there are always other decent people. This is one of the explanations for achieving remarkable results by leaders: building a homogeneous team, deeply and consistently involved in the major issues of the organization (Bejinaru, 2010).

Conclusions

The complex issue of leadership has been a point of interest for more than a century, with specialists wishing to find out who they are capable of impressing their organizations and influencing their important activities. Leadership targets group work and team creation. Groups tend to have leaders, and leaders strive to create groups. In fact, if a person takes up a manager position, he is considered the leader only when his position is received as such by those who work with him in the company. Adair, shows that the concept of leadership can be explained by three needs of the working group: (1) to carry out a common task, (2) to manifest and function as a team and (3) to manifest as an individual.

Organizations require teams to set and then achieve their goals so that they can achieve their own goals. An increasingly widespread phenomenon is the use of multifunctional teams that bring together individuals from different teams to improve communication and decision-making. Organizations require teams to be agents of renewal, change, and even revolution. In order to change organizational goals and strategies, a team must have a clear plan of what it intends to achieve, and the plan must be articulated clearly and coherently, it must be flexible in terms of the opinions of others. In the case of teams, perseverance and participation are essential, but organizational conflict may also arise, in some cases the promotion of organizational change. The performance of virtual teams depends on a number of factors that are influenced by technology, such as the quality of communication relationships, task planning and group projects, coordination, development of a common understanding of the task, trust, team commitment and satisfaction, team identity development and conflict management.

Forming and asking teams to solve the core tasks of the organization proves essential in promoting a modern leadership. Today teamwork is increasingly seen as a major requirement for effective leadership as "leadership involves the team" (Kostenbaum, 2006). Finally, the leader must have a special ability to combine aggressive personal ambition, independence of thought and individual ingenuity with always cooperative thinking, communication, caring for others, joint efforts, people's motivation, desire to develop, and evaluation of the help given by each individual.

Abstract. *The purpose of this research is to test the existence of a relation between knowledge and information management in competitive advantage and innovation. Using a questionnaire, we collected 209 responses from different types of organizations. This questionnaire allowed us to test the proposed conceptual model that analyzes the relationship between the competent ones of a knowledge management system: processes, human capital and information systems and the information sharing practices, knowledge acquisition and identification practices and information and knowledge storage practices, and the process of creating innovation and competitive advantage. The results did not confirm most of the assumptions tested, nor did the knowledge management practices statistically reveal a relationship with the creation of innovation and with the creation of competitive advantages. However, there was a significant statistical relationship between process factors, human capital factor, innovation and the creation of competitive advantages.*

Keywords: *knowledge management; information; innovation; competitive advantage.*

Introduction

This study deals with knowledge management in organizations. Nowadays, society tends to rely on knowledge and information sharing to create value for organizations (Grant, 1996). Through knowledge and information sharing, organizations become more competitive, not only by reducing costs but also by optimizing capabilities and resources in the production of products or services. Thus, organizations will be responsible for building models for the management of all the information and knowledge they have, which will need specific management (Grant, 1996). In Drucker's (1985) opinion, knowledge is the unique base that companies use to build competitive advantage. Firms should "adapt and update their knowledge to maintain their competitive advantage" (Liao et al., 2017, p.1432).

One of the purposes of this work is to analyze the processes used by companies to promote the exchange of information and the creation of knowledge and value for the

organization. Therefore, the main goal is to understand the importance of information and knowledge shared in the organization in order to create innovation and competitive advantage.

Literature review

Currently, the opinions regarding the emergence of the vision of a knowledge-based enterprise development are consensual, agreeing that it is a fundamental strategic asset (Grant, 1996). If previously the company's wealth was strongly associated with tangible factors such as financial capital and physical structures, nowadays the main source of wealth and competitiveness seems to be knowledge. As Tsai (2001, 1003) claims, "An organization is a repository of knowledge". In the same vein, Argote and Ingram (2000) talk about reservoirs, because companies keep knowledge for future use. Knowledge management involves maximizing and leveraging the potential of the organization's human resources (Ponchirolli & Fialho, 2005).

Knowledge management is a systematic process that generates information, data and new knowledge so that it might be organized and used in the most correct way by companies. Only this process brings knowledge to the right people at the right time, this time will be needed for taking better decisions and to find better resolutions for recurring problems in the company's activity (Allameh, Abedini & Ahmad, 2012).

According to Maier (2007), the main goals of knowledge management are to provide cost reduction; improvement in communication and in external knowledge acquisition, cooperation and distribution. It also increases productivity; as well as the speed of innovation; and the new business development - this way reducing the risks taken by the company, (i.e. improving the ability to react according to the constant change in markets and the loss of valuable knowledge for the company. Consequently, improving stakeholder satisfaction, improving the quality of services and, when appropriate, improving response time (Santos, 2011). There is, therefore, a close relationship between knowledge management and competitive advantage (Hamel, 2002) and between this and innovation.

Knowledge management

The process of knowledge management and sharing is the result of a context that facilitates the creation and dissemination of this knowledge (Nonaka, 1994; Davenport & Prusak, 1998).

A knowledge and information management system is a set of procedures that aim to collect, create, absorb, use and distribute information and knowledge, which leads to the creation/improvement of the learning process in an organization. Tsai note that it is not only about absorbing knowledge, but gaining knowledge access (Tsai, 2001). In fact, "[i]n order to prevent imitation or duplication by competitors, most enterprises generally acquire new knowledge from a unit outside the organization or learn new knowledge introduced from a unit outside the organization and then integrate the new knowledge in order to develop knowledge that belongs exclusively to the organization" (Liao et al., 2017, p.1432), in a multiunit organizations, other units can be a source of new knowledge too (Tsai, 2001).

The management and sharing of knowledge are based on three fundamental dimensions: people, processes, and systems. Knowledge management and sharing lead to the creation of knowledge, which in turn creates innovation, altering existing processes and creating organizational competitiveness.

Identification and acquisition of knowledge

According to Rollet (2003), the knowledge identification process is based on the planning and constant monitoring of knowledge and information management initiatives.

Organizations tend to focus on the past and present in terms of knowledge management, which is a frequent mistake (Fahey & Prusak, 2004). The most correct posture is to direct and prepare the position of the organization for the future. According to Rollet (2003), the process of knowledge management allows the organization to have an orientation towards the achievement of its strategic goals, which contributes to the incensement of organizational competitiveness. "Through the acquirement of new knowledge and the updating of existing knowledge, an organization can have better learning and innovation performance and thus develop a sustainable competitive advantage" (Liao et al., 2017, p.1432).

Davenport (1994) refers to the importance of determining the information and knowledge needs by a company, and Mcgee and Prusak (1994) point out the importance of the organization's perception of information and knowledge necessities in order to make the organization competitive. As Bierly et al (2000, in Bou-Llugar & Segarra-Ciprés, 2006, p.101) defend "Success does not necessarily go to the firms that know the most, but to the firms that can make the best use of what they know and know what is strategically most important to the firm".

It is important to bear in mind the relevance of knowledge identification in an organization, as well as its retention, capture, and analysis (Probst, Raub & Romhart, 2002). The same authors consider that external knowledge can be acquired through relationships with clients, by competing with other companies, suppliers, and others. It is important to note that information and knowledge can also be obtained internally.

H1: There is a positive relation between the practices of identification and acquisition of knowledge and knowledge management practices.

H2: There is a positive relation between the practices of identification and acquisition of knowledge and innovation.

H3: There is a positive relation between the practices of identification and acquisition of knowledge and organizational competitiveness

Innovation and competitive advantages

Knowledge creation and sharing influence innovation leads to competitive advantage (Mcadam, 2000). Internalization by the organization's tacit and explicit knowledge produces new knowledge that leads to constant organizational learning, and this leads to innovation that gives the organization a sustainable competitive advantage (Meso & Smith, 2000).

There are, therefore, conditions to foster knowledge creation such as the existence of a climate of innovation within the organization (Nonaka & Takeuchi, 1994), this factor will encourage the generation of a set of organizationally sustainable competitive advantages. Obtaining information and knowledge through internal and external means is a source of competitive advantages (Davenport, 1994).

H4: There is a positive relation between innovation and competitive advantages.

Retention of knowledge

Retention of knowledge is related to the integration of internal and external knowledge in the organization, avoiding the loss of knowledge (Rollet, 2003). The competitive edge in knowledge retention process, according to Birkinshaw and Sheehan (2002), comes through the organization's ability to access information and knowledge also in qualitative terms, increasing the failure of competitors trying to copy it. For these authors, gains will also be achieved in terms of organizational competitiveness.

The retention of knowledge to Probst, Raub, and Romhart (2002) depends on the retention of knowledge by identifying through documents, information and most important experiences observed in the environment of the organization. McGee and Prusak (1994) report also the importance of storage, classification, and authentication of information and knowledge. So, this must be inserted in the organization's production process, so that it can be superior to its competitors and gain competitiveness and competitive advantages.

H5: There is a positive relation between the practice of storing information and knowledge in the organization and its organizational competitiveness.

H6: There is a positive relation between the practice of storing information and knowledge in the organization and innovation.

H7: There is a positive relation between the practice of storing information and knowledge in the organization and knowledge management practices.

Sharing of Knowledge and Information

Knowledge sharing processes are important to increase the exchange of knowledge and information among members of the same organization (Rollet, 2003). Knowledge sharing has a positive effect on the creation of innovation which will expand to organizational competitiveness. Macgee and Prusak (1994) consider essential the treatment and dissemination of knowledge and information, in order to homogenize the treatment of knowledge and information according to the needs of the recipients.

Davenport (1994) refers to the importance of sharing information and knowledge according to organizational needs. McGee and Prusak (1994) point out the importance of elaborating strategies to capture, treat and share knowledge to satisfy organizational needs, as well as highlight the importance of analyzing, distributing and disseminating information, sharing it and also sharing knowledge according to the organizational needs of the company and the members of the same organization and use of it as support for the decision-making process.

This process leads to the transformation of something that is isolated, such as information or knowledge, into something that the organization can use in the productive process and as a source of value creation and competitiveness (Probst, Raub & Romhart, 2002).

H8: There is a positive relation between knowledge sharing practices and information and organizational competitiveness.

H9: There is a positive relation between knowledge sharing and information practices and knowledge management practices.

H10: There is a positive relation between knowledge sharing and information sharing practices and the creation of innovation.

Knowledge management, innovation, and competitive advantages

There is a set of the complex relation between knowledge management and the creation of competitive advantages by the organization.

If there is a knowledge management system in an organization, this system will allow a competitive advantage to be obtained by the organization, through the identification of threats to the organization, reduction of reaction times and through an improvement of the process strategic planning and analysis, there is support for the decision-making process and promotion of innovation and creation of new products (Davenport, 1995; Meso & Smith, 2000; Nokata & Takeuchi, 1997). There is also the advantage of perceiving market trends in a proactive way - this capacity will implement a value creation strategy for the organization and for the customers, but will not be used by competitors, because of the fact that it is difficult to imitate.

According to Edwards (2011), knowledge management results from the relation between three factors: people, processes, and technology. Correct process management is essential for effective knowledge and information management.

H11: There is a positive relation between knowledge management practices and innovation.

H12: There is a positive relation between knowledge management practices and competitive advantages.

H13: The process factor positively influences the competitive advantage of the organization.

H14: Process factor influences positively the creation of Innovation.

H15: The process factor influences positively knowledge management practices.

H16: The human capital influences positively the organization's competitive advantage.

H17: The human capital actor influences positively the creation of innovation.

H18: The human capital actor influences positively knowledge management practices.

H19: The technological systems actor influences positively the competitive advantage of the organization.

H20: The technological systems actor influences positively the creation of innovation.

H21: The technological system influences positively knowledge management practices.

Hence presents the proposed model (Figure 1) which seeks to answer the research question – Is internal diffusion knowledge and information in organizations a factor of creation of competitiveness organization?

Figure 1 - Knowledge Practices and Competitive Advantage

Research methodology

Table 1 - Structure of the Questionnaire

QUESTIONS	Subgroup	
8	Firm characterization	
4 – Likert Scale	Knowledge Management - PGC	MacGee and Prusak (1994)
10 – Likert Scale	Knowledge identification and acquisition - PAIC	Davenport (1995)
9 – Likert Scale	Processes – FP	Fonseca (2006)
8 – Likert Scale	Human Capital - CH	Probst, Raub and Rombart (2002)
5 – Likert Scale	Technological Systems - FST	Fonseca (2000)
6 – Likert Scale	Knowledge and acquisition Storage - PARIC	Edwards (2011) MacGee and Prusak (1994)
6 – Likert Scale	Knowledge and Information Sharing - PPCI	Davenport (1995)
3 – Likert Scale 4 – Likert Scale	Competitive Advantages - VC	Sigalas (2013) Own elaboration
9 – Likert Scale	Innovativeness - I	Uzkurt, Kumar, Kimzan an Sert (2012)

We opted for Structural Equation Modeling (SEM), Zwickler, Souza and Bido (2008) reporting that the SEM is a set of instruments that allows the combination of a structural model and a measurement model, both being evaluated simultaneously.

Results

There were 327 responses, 209 valid answers, all answered by members of the organizations that participated in the decision-making process.

In terms of company size, in the sample 19.1% of the organizations, it had more than 250 employees; 21.8% of the responses between 51 and 250, and the majority (59.1%) less than 50; most companies (39.1%) had a turnover lower than 2,000,000€, 28,2% between 2,000,000 € and 10,000,000 €, 15% between 10,000,000 € and 50,000,000 € and 17,7% with a value of more than 50,000,000 €. We found that most businesses are SMEs.

36.8% of the companies belong to the manufacturing industry, 12.3% for scientific and technical consulting activities, 9.5% for financial activities and insurance, 9.1% wholesale and retail trade; 8.6% in other services activities, 5.9% in construction, and 17.80% in other sectors of activity.

Measure model validation

Table 2 – Confirmatory Factorial Analysis

	Alfa de Cronbach	CR	AVE
PGC			
VC	0,919	0,935	0,675
PIAC	0,921	0,934	0,591
FP	0,923	0,937	0,623
FCH	0,918	0,933	0,635
FST	0,933	0,952	0,832
PARIC	0,873	0,904	0,615
PPCI	0,957	0,965	0,823
I	0,904	0,922	0,575

To validate the model, we calculated Cronbach's alpha, CR, AVE, and R2. The PGC construct was not subjected to these tests because it is a formative variable. All scales have indicators above the required.

Interpretation and discussion

The estimation was done through the Bootstrapping calculation, due to this calculation; we obtain a large set of random subsamples, resulting from an original data set, which supports the PLS model, allowing the same statistical significance of the variables (Hair Jr., Hult, Ringle & Sarstedt, 2016).

Table 3 – Bootstrapping Results

H1-There is a positive relation between the practices of identification and acquisition of knowledge and knowledge management practices	pvalue=0,000 T=3,607 Not Rejected (5%)
H2-There is a positive relation between the practices of identification and acquisition of knowledge and innovation	pvalue=0,128 T=1,526 Rejected
H3-There is a positive relation between the practices of identification and acquisition of knowledge and organizational competitiveness	pvalue = 0,752 T=0,316 Rejected
H4-There is a positive relation between innovation and competitive advantages	pvalue=0,000 T=5,030 Not Rejected (5%)
H5-There is a positive relation between the practice of storing information and knowledge in the organization and its organizational competitiveness	pvalue=0,324 T=0,988 Rejected

H20-The technological systems actor positively influences the creation of innovation	pvalue=0,677 T=0,417 Rejected
H21-The technological system positively influences knowledge management practices	pvalue=0,944 T=0,07 Rejected

Taking into account the values obtained in T-Statistics and P-Value, it is verified that only the hypotheses H1, H4, H6, H13, H15, and H16 are statistically relevant, i.e. those with T-Statistics values greater than 1.96, in the same way, the P-value is less than 0.05.

Using the literature studied, it would be expected that knowledge management practices would have an influence on innovation and, directly or indirectly, on competitive advantage. But these were not found in this study. Meso and Smith (2000) consider that an organizational system of knowledge management is the result of the interaction between technological infrastructure, organizational infrastructure, corporate culture tacit knowledge, explicit and people. They also consider that the practices of knowledge management create new knowledge that leads to innovation and the consequent creation of competitive advantage on the organization part.

The effect of the human capital factor on innovation is also not statistically significant. Although human capital is referred in the literature as the main factor contributing to innovation, in practice we have verified that the relation between knowledge sharing and information practices and the relation between the human capital factor and innovation is not statistically significant. So, as there is no sharing of knowledge and information, it is perfectly normal and consistent with the literature, that human capital does not have a significant effect on innovation. Moreover, knowledge sharing implies codification, transforming tacit knowledge into explicit knowledge, which is easier to imitate and more difficult to protect (Bou-Llusar & Segarra-Ciprés, 2006).

The human capital factor and the process factor have a statistically significant effect on the competitive advantage; however, the technological systems factor has no statistical impact on the competitive advantage of the organization. One possible explanation for this fact is that advances in the field of technology in organizations might provide competitive advantages to that certain organization. Due to this, the advantage can be reduced or eliminated as systems can be easily replicated even when protected by copyright, patents, and licenses. Meso and Smith (2000) report that competitive advantage becomes sustainable when current and potential competitors are unable to imitate the strategy and resources of the company that holds the same competitive advantage. However, information systems can be easily imitated and improved and, for that reason, they will not constitute a sustained source of comparative advantage. In opposition to the human capital, that is inimitable and carries unique characteristics.

We can infer from the obtained results that the process factor works as an inter-mechanism between the knowledge management practice and the competitive advantage - this conclusion is consistent with the literature regarding this subject.

In fact, Edwards (2011) considers that the organization should give greater relevance to the process factor, since this represents the way in which the organization and people give use to the technological factors, both being essential for the process of knowledge management and, consequently, for the process of creation of competitive advantages.

Information storage practices have a statistical influence on the competitive advantages of organizations, albeit through their influence on innovation. Edwards (2011) states that the human capital factor and the process factor have a direct impact on the competitive advantages, being supported by repositories or by the existing knowledge systems in the organization. Following the same order of ideas, Mcgee and Prusak (1994) mention the importance of storing, classifying and authenticating information and knowledge. According to this, it should be inserted into the production process of the organization, in order to be able to excel before their competitors and increase the competitiveness of the company and their competitive advantages. In this study, this relation is not presented directly as in the sample selected for the study, the practices of information and knowledge storage do not have a statistically significant effect directly on the competitive advantages, but have, on the other hand, a statistically proven effect in the variable innovation.

Knowledge is worked and transformed into material available in printed material or knowledge bases, which have a positive effect on the creation of innovation, supporting the statistically significant relation between practices of information and knowledge storage and innovation. It is relevant the direct statistical proven influence that human capital has on the competitive advantages of an organization which comes in line with Edwards opinion (2011). The OKA model (2006) claims the importance of human capital is a more qualified learning process, based on training and providing knowledge and information with the purpose of improving the company's performance

It is to consider that the factors process and the identification of practices and knowledge acquisition have a statistically significant influence in the practice variable knowledge management and this correlation confirms what was already expected. For Davenport (1995), information and knowledge management are defined as a set of structured activities that include how companies can obtain, distribute and use information and knowledge.

It should be admitted that, in most organizations, only people and technology stand out, excluding other factors of extreme importance (Edwards, 2011). It is necessary to keep in mind that the process is the way in which organization inserted people use the technology with relevance in the practices of knowledge management. Argote and Ingram (2000, p.164) note that "people play the most critical role in the success of technology transfer. The unequivocal contribution is proven by the statistical significance of the hypothesis that relates these two variables (factor processes and practices of knowledge management).

Conclusions

The purpose of this study was to understand if there was an effective relationship between knowledge management practices and information and the creation of competitive advantages by organizations.

The results of this study do not confirm that, in general, knowledge management components have a positive effect on innovation and competitive advantage. Only the variables human capital factor, process factor and innovation have a statistically significant relation with the creation of competitive advantages. This reinforces the idea that "human may be the most difficult to imitate" (DeNisi, Hitt & Jackson, 2003, p.4). As far as innovation is concerned, only the practices of storing information and knowledge in the organization have a statistically significant influence in this factor. Through the process of knowledge and information storage practices, we classify the type of knowledge and information that the organization holds and where it is located in order to manage, organize and integrate it. This type of tool supports the strategic decision of a company, transforming data into information and knowledge, leading to the creation of innovation and comparative advantages, according to Choo (2006). This author states that in an organization, the storage of the information captured and created in files and databases through different information systems will facilitate the sharing of knowledge retrieval and information relevant to it.

The process factor is important since it constitutes the bridge between human capital and technology.

To point out the positive effect that human capital factor has in competitive advantage should theoretically be the most important thing in the process of knowledge management, being the largest source of knowledge and information within an organization. However, this hypothesis was not confirmed statistically. The valuation of the human resources of an organization is a propelling factor in the creation of organizational competitiveness, in such a way that it provides the human resources with greater information and knowledge to perform their functions and to create added value to the organization they are part of

Another conclusion of the study is that innovation is a factor propelling the creation of the competitive advantages process. In the model created, the knowledge management practices, which are a mediator variable, have a direct relation with the creation of innovation which, in return, has a direct relation with the creation of competitive advantages. Despite the fact that the relation between knowledge management practices and the creation of innovation, or the relation between knowledge management practices and the creation of competitive advantages, have not been statistically proven.

Based on this study, organizations should invest in the developing of their knowledge management systems, as well as an appreciation of its employees by encouraging training, learning, personal and professional development and integration reviewer on the process of creating new knowledge. Only after completing this process, the organization is capable of differentiating itself from competitors, by creating new products and services and by improving existing ones resulting from the organizational innovation process.

Thus, creating new processes, new technologies and a growing improvement in the skills and qualifications of the human resources is not enough to support the process of creating knowledge and information. It is essential to implement an organizational culture that fosters the storage and the sharing of knowledge and information. Since knowledge and information are increasingly seen as a valuable resource for organizations and for all the economy, the potential for knowledge and information enhance and creation is virtually unlimited.

The present study presents some limitations that limit the obtained results. That way, it is suggested as pertinent in future investigations to improve the method of collection and measurement of data, as well as to increase the size of the sample. Another limitation to be pointed out is related to the variables of the proposed conceptual model, as this is a very complex issue other variables must be included and study.

AWARENESS CREATION ON E-BANKING FRAUD PREVENTION: A KNOWLEDGE MANAGEMENT PERSPECTIVE FOR E-SECURITY AND CUSTOMER RELATIONSHIP BUILDING

Rachel BARKER

University of South Africa

P.O. Box 395, Pretoria, 0003, Republic of South Africa

barker@unisa.ac.za

Abstract: *E-banking, also known as electronic or Internet banking, has become a prevalent mode for online and internet-based transactions. However, modern databases, online information and knowledge sharing, and increased access points for e-banking transactions opened opportunities for sophisticated fraudsters to perpetrate and abuse customers in their social, cyber and physical worlds. The intensification in cases of fraud presents tremendous challenges for the banking sector to caution, educate and inform customers on cybercrime because it reflects the synthetic and integrative use of the interaction between resources which include the fraudster's intelligence abuse in the social world, the abuse of knowledge resources and technology in the cyber world and the abuse of resources and trading tools in the physical world. Most studies focus on the detection of fraud patterns through tapping in data warehouses of third-party or by using data mining programs to identify fraud patterns, specifically credit cards, computer intrusion and mobile communication or first-party fraud when a legitimate customer knowingly betrays the bank. This study focuses on the prevention of fraud that falls into two main categories, namely: phishing/vishing/SMishing and malware practices (any activity of payment fraud where fraudsters gain access and uses customer' accounts for their own unlawful financial benefit); and identity theft (gaining access to or opening new accounts in the customer's name). The main premises of the research problem are built on the fact that a lack of studies exists to investigate the use of proactive communication through the three typologies of knowledge management to create awareness and educate customers on e-security measures and prevention of e-banking fraud where the move towards (co)liability should not impede but enhance customer relationship building. The research is conducted through a qualitative research methodology and the subject under study was the website of the South African Banking Risk Information Centre (SABRIC) purposefully sampled. The three concurrent cyclical flow of activity of the data analysis interactive model was used in the research. An abductive approach was used to report on the findings based on descriptions and interpretive comments relating it to and drawing on the theoretical thrusts identified. Main findings suggest, inter alia, the importance to proactively educate customers on how to protect themselves before they fall, victim, the importance of visibility on security measures, methods and standards for e-banking, and the move towards a (co)liability policy and shared responsibility process.*

Keywords: *Knowledge management; knowledge sharing; e-banking security; fraudulent e-banking transactions; customer relationships.*

Introduction

Despite the continuous efforts of the financial industry to increase consumer awareness on fraudulent e-banking transactions, the dominating lack of clarity about when precisely clients have acted negligently by denying to refund them has become problematic, which can lead to a demand for better e-security to ensure customer relationship building. According to Mhamane and Lobo (2012), e-banking has become a prevalent mode for both online and Internet-based transactions resulting in an intensification in cases of fraud associated with it. It provides fraudsters with more opportunities to attack customers, especially because they are not physically present to authenticate transactions and might even facilitate organized attacks (Barker, 2016). The results of a study conducted by Carminati et al. (2015, p.176) highlighted the significant growth of e-banking frauds, fueled by the underground economy of malware. According to them, Internet banking frauds are difficult to detect because the fraudulent behavior is dynamic, spread across different customer profiles and is dispersed in large and highly imbalanced datasets (e.g. weblogs, transaction logs, spending profiles). These results set the scene for this study to investigate the need for proactive communication and education of customers to create awareness on the prevention of fraudulent e-banking transactions through knowledge management (KM) and knowledge sharing to caution and inform them on the move towards (co)liability in cases of neglect. The dynamics of e-banking transactions in a virtual environment is not a narrow issue that only applies to online communication. Although recent research focuses strongly on fraud detection measures and patents (Leite et al., 2018, p.333), limited research is conducted on fraud prevention. Consequently, the purpose of this study is to test a conceptual framework developed from a combination of different viewpoints to identify and discover different types of frauds and to examine how Africa's trusted financial crime risk information center leveraging on strategic partnerships used their website as one way for fraud prevention by conveying information following fraudulent e-banking transactions. to proactively manage and/or prevent customers to fall victims to these fraudulent actions. Specifically, the study focuses on the way in which KM, through change agents or communication 'experts', can create a positive effect towards e-banking transactions through the control of messages in fraud prevention. For the purpose of this study "fraud prevention describes the security measures to avoid unauthorized individuals from initiating a transaction on an account for which they are not authorized" (Kovach & Ruggiero, 2011, p.166).

The paper is structured as follows. Firstly, a synopsis of the theoretical underpinning based on an extensive literature review is presented with a specific focus on fraudulent e-banking transactions, customer (co)liability, e-security and customer relationship building. Secondly, the theoretical research framework is proposed. Thirdly, the methodology, data analysis, and results are presented. Finally, a discussion of the main results based on the knowledge management typologies which can be used to manage and control fraud prevention are described.

Key concepts

For application purposes, the key concepts of interest to this study are as follows:

Fraudulent e-banking transactions

Fraudulent e-banking transactions are among the most money-spinning types of cybercrime today. According to Van der Meulen (2013, p.713), "the increased sophistication of attacks has complicated prevention and detection efforts, which in turn has allowed their success to proliferate". This has increased the financial burden on both the service providers and the customers where the latter are running increasing legal risks of being exposed to financial losses due to neglect. Although the general assumption is that customers are not liable and that banks refund the financial losses of victims of Internet or e-banking fraud, the banking industry is moving towards customer liability and/or co-reliability. Jansen and Leukfeldt (2015, p.31) emphasize the need to educate customers to avoid fraudulent schemes. According to Andrews and Boyle (2008, p.60), the main inhibiting factors for many forms of transactions which affects customer relations, are that of perceived risk, e-security, trustworthiness, and privacy, especially in Internet banking, which influences customer's perceptions and behavior to adopt or reject these offerings. Various viewpoints exist on perceived risks depending on the predefined perspectives of the researchers to reflect the particular context under examination. Because the purpose of this study is to examine the move towards (co)liability, the focus will be on proactive communication through the website on possible risks of fraudulent transactions and preventative measures. According to Edwin Agwu (2018, p.187), the main concern for banks is a reputational risk which can lead to loss of valued customers, loss of efficient employees, smeared reputation from frauds, customers might shy away to protect their own risk and loss in future cash flows. For the customer, the perceived risk defined by Sathy (1999, p.326) as "the security and reliability of transactions", is the risk of losing money through fraudulent transactions or that personal information might be misused (Drennan, Sullivan Mort & Previte, 2006). It is posited that proactive communication through knowledge sharing can negate potentially these negative risk consequences to enhance customer relationships by taking away the uncertainty for customers and banks by simultaneously making discussions on clarity and constancy obsolete.

Customer (co)liability

Due to the increase in fraudulent banking transactions, banks are starting to expect more from customers in response to years of awareness campaigns and argue that they count on a certain level of awareness that can be used as a vehicle to transfer the liability from the side of the bank to the customer. This is hampered by two concerns. Firstly, the lack of clarity about the qualification of gross negligence and care which can be open to interpretation. To address this concern, banks argue that the specificity of a warning allows for the transfer of liability to the customer. In other words, if perpetrators use a 'known' attack of which clients were warned against and are successful, then the customer acted negligently and should be liable. This leads to the second concern of consistency, causality, and reasonableness where the liability can be circumstantial (for example if any form of social engineering was absent, lines of liability not specified, the burden of proof for customers and banks, etc.). One line of liability which clients agree to in terms of use by opening and subsequently using the account is the installation of anti-software (usually provided by the bank online free of charge). In addition, ignoring the warnings of malware and phishing/vishing/SMishing by clicking on links and responding to emails and mobile communication are serious fraud threats, but the inclusion of more specific terms of use might reduce the lack of clarity and consistency

since banks will then be more transparent about their expectations. (Van der Meulen, 2013).

E-security

Yousafzai, Pallister and Foxall (2003, p.849) defines security as a threat which creates "circumstance, condition, or event with the potential to cause economic hardship to data or network resources in the form of destruction, disclosure, modification of data, denial of service, and/or fraud, waste, and abuse". In the context of e-banking, threats can be made either through network and data transaction attacks or through unauthorized access to the account by means of false or defective authentication. Perceived security then is the customers' perception of the degree of protection against these threats. Studies suggest that the greatest challenge to the e-banking sector will be to gain the trust of customers over the issues of privacy (personal information) and w-security (interception). According to them, financial institutions can build mutually valuable relationships with customers through a trust-based collaboration process. This is particularly true in the case of e-banking where there is a physical separation between the bank and the customer, circumstances are difficult to predict, and the relationships are difficult to monitor. Furthermore, websites can be counterfeited, online identities can be forged and electronic documents can be falsified. Another concern is the lack of adequate regulatory control which leads to the customers' perception that their personal information may be used without their knowledge during or after navigation. Therefore, it is argued that a trusted financial institution will take steps toward the development of institution-based trust associated with the Internet infrastructure and reducing the environmental risk associated with a focal transaction.

Customer relationship building

The Web, specifically the Internet, offers financial institutions the opportunity to build relationships with their customers and stakeholders and can be used to offer diverse information on a variety of information and services, including information on fraud, and to correct misinformation. Despite the growing importance of proactive communication on websites, the research found that websites are limited in terms of communication with customers and employees in fraud prevention, but emphasize the importance to use it as an additional means to and not replace the use of traditional media (Greer & Moreland, 2003). Although no consensus has been reached in the literature on the specific dimensions of sustainable relationships, they are generally considered as a higher order concept encompassing different inter-personal aspects (Larghi et al. 2015, p.18). More recent empirical studies suggest that sustainable customer relationships encompass qualities such as mutual trust, satisfaction, and commitment (Lages, Lages & Lages, 2005, pp.1040-1048) to address perceived risk.

Theoretical framework

The accelerated capacity of e-banking transactions and the Internet can either empower a customer or counteract the threats posed by the increasingly fragmented media landscape. One way to counteract this is to engage with customers through proactive communication and knowledge management by incorporating safety and security messages on the website to warn and reassure customers of prevalent fraudulent transactions. Authors like Gonzàles-Herrero and Smith (2008, p.145) point out that the Internet either acts as a 'trigger' caused by rumors, hacking, copycat websites, web

security breaks and all forms of cyber-terrorism/cyber crooks; or a ‘facilitator’ as an agent that accelerates messages to provide new knowledge. Consequently, it is argued that the knowledge management theory, one of the most prominent theoretical approaches to study online communication, is one way of facilitating messages for fraud prevention. One of the key discourses of the knowledge management paradigm is that embodied, tacit, implicit and narrative knowledge are important phenomena and fundamental to all human knowing (Nonaka & Takeuchi, 1995) because it allows for the transformation, sharing and processing of knowledge in four different forms: socialization, externalization, combination, and internalization (Nonaka & Takeuchi, 1995; Barker, 2016). If it is argued that the KM paradigm presents a way to proactively manage and control the messages which are acquired, transferred and assimilated to ensure that knowledge is created, distributed and shared (Nonaka & Takeuchi 1995; Lee et al., 2013).

The starting point of this study is therefore evidenced in the processes of KM as a comprehensive approach to online communication in general, and in this paper particularly with regard to proactive communication for the prevention of fraudulent e-banking transactions. A conceptual framework explains, either graphically or in narrative form, the key constructs, and variables or factors that need to be studied and the presumed interrelationship between them (Miles, Huberman & Saldanha, 2013). For the purpose of this study, a graphical conceptual framework is presented based on the current version of the researcher’s map obtained from a comprehensive literature review and the important variables identified in the qualitative research. Figure 1 proposes a conceptual theoretical framework for e-banking fraud prevention and (co)liability through proactive communication.

Figure1. Conceptual framework for e-banking fraud prevention and (co)liability through proactive communication

The focus in this conceptual framework is on fraud prevention using the three typologies of knowledge management to communicate with customers proactively. In this context, knowledge acquisition refers to the provision of instructing information on the website to customers when a new fraudulent action is identified and/or to remind them of existing methods and procedures. It encompasses data gathering and mining, as well as knowledge construction based on the discovering of new knowledge. Three main types of messages should be constructed: basic facts about fraud; updating of existing information and facts; and provision of new information and messages to prepare customers for what to expect and how to react to it. This is usually done through a Security Centre website and anti-fraud software pop-ups, to warn customers when they access their accounts and detailed links to cover the broad spectrum and context of fraudulent transactions. Knowledge transfer is necessary to move into creating and adjusting the communication messages by posting various messages and linking customers to websites for direct real-time interactions and by sharing information to ensure them of the safe and secure use of online transactions. Examples of possible real-time fraudulent transactions should be included on various websites and links to transfer this knowledge to the customer. Knowledge assimilation should be substantiated through the control and management of the messages in the pre, present and post stages of fraudulent actions by presenting methods and procedures to ensure safe e-banking transactions, providing informal and formal settings for interaction (for example hotlines and online links), stating company practices to address fraud and the context in which it is managed and controlled. This is usually corroborated through linking of customers to the Security Centre, Online Fraud Updates, media releases, campaigns, general security messages (formal or informal), and detailed methods, practices, and procedures to address it proactively and reactively.

From this theoretical perspective, it is argued that the knowledge management paradigm offers the opportunity to manage and control proactive communication and knowledge sharing (the convenience in assessing information through information and knowledge collection and knowledge donation) as a significant antecedent to address reputational risks and innovation performance. This is done through systems, methods, prompts, direct real-time experiences, etc. to educate, train and create awareness by customers to prevent third-party fraudulent transactions by means of these typologies through a series of messages and links to assure customers of safe and secure online transactions. It is further posited that these typologies should be used consistently and continuously to create awareness on fraudulent e-banking transactions in the social, cyber and physical worlds of both the customer and the banks. Customers should be educated to create awareness on phishing/vishing/SMishing and malware fraudulent banking transactions and identity theft to prevent these actions. Through constant prompts, customers should be made aware of existing and/or new fraudulent transactions to ensure that the concept of (co)liability becomes a crucial concept in the prevention of fraudulent e-banking transactions. The creation of e-security and e-trust will then lead to sustainable customer relationships to build loyalty and maintain or enhance the reputation of the organization.

Research methodology

This research was conducted through a qualitative research methodology which was conducted in the natural setting of the subject under study and focused on unexplored processes (Babbie, 2007; Chambliss & Schutte, 2006), in other words, the real online

web site available to all users; and entailed a qualitative content analysis of websites on the prevention of fraudulent e-banking transactions and e-security based on the identified and characterized theoretical typologies as indicated in Figure 1. The subject under study was the South African Banking Risk Information Centre (SABRIC) who, on behalf of the banking industry, caution the public on banking crimes through proactive communication and knowledge sharing on their website. SABRIC is a Non-profit Foundation formed by the four major South African banks and has 23 Member Banks to support the banking industry in the combating of crime. SABRIC'S clients are South African banks and major CIT companies with the main business to detect, prevent and reduce organized crime in the banking industry and to co-ordinate inter-bank activities aimed at addressing organized bank-related financial crime, violent crime and cybercrime through the creation of public awareness and deducting the public to protect themselves and acts as a nodal point between the banking industry and others, in respect of issues relating to these crimes.

The measuring instrument employed was therefore qualitative research through a case study-based analysis of the website on fraudulent e-banking transactions of SABRIC selected through a purposive sampling as they present most financial institutions in South Africa, was willing to participate in the research, information of the website was easily accessible, availability of information, the right to use information obtained through data mining, etc. The criteria were derived from a comprehensive literature review and based on the conceptual framework and examined data collected on how SABRIC used their website as one way to manage and control messages in a three-year period (April 2016 to April 2018) before or after incidents of fraudulent e-banking transactions and/or security measures were put in place for the prevention of fraud.

For the purpose of this paper, the four concurrent cyclical flows of activity identified by Miles, Huberman and Salanda (2013) have been used. Firstly, data collection was aimed to investigate the use of proactive online communication to ensure the control and management of fraudulent e-banking transactions. The data gathered was information on preventative measures posted on the SABRIC website during the specified time period and by printing available and accessible pages that were primarily associated with information about the prevention of fraudulent e-banking and/or e-security and safety of online transactions. Secondly, data condensation was used as the process of selecting, focusing, simplifying, abstracting and/or transforming the data that appear in the full body of the selected website information releases in terms of the theoretical criteria and framework (Miles, Huberman & Salanda, 2013). Thirdly, data display was used to organize, compress and assemble the information that allows for the systematic and powerful displays of conclusion drawing. Lastly, drawing and verifying conclusions reflects the interpretation by means of noting patterns, explanations, casual flows, and propositions. These components are interwoven before, during and after data collection to make up the general domain called 'analyses'. The data displayed included all media releases, videos, campaigns and safety measurements on fraudulent e-banking transactions. In order to determine the cumulative number of fraudulent-related messages posted by SABRIC on the website, the researcher conducted a post hoc analysis of the sites' contents. Included in the analyses were additions and deletions of individual company generated messages (for example media releases from the agent or expert). The material printed included fraudulent e-banking transaction specific pages and links to additional information (campaigns, media releases, and videos). Internal validity has been addressed through consistent evaluation of the website addressing the

concepts under investigation. This study also addresses validity through the question of generalization by using the typologies indicated in Figure 1 as generally apparent in knowledge management and proactive communication that can be used in comparative studies in future.

Data analysis

Data was analyzed through an iterative process using coding of data to identify typologies of initial concepts, identify integrative concepts applicable to all the subjects under study and selective coding to reduce it into emergent themes. The researcher also applied the concept 'lurking' as a non-participative observer trying to understand the meaning transferred to the customers through the three components KM and focused only on asynchronous communication (communication with people through a one-to-many approach at different times). During the specified time frame the website monitored resulted in the following main message constructions and links on e-banking fraud prevention as indicated in Table 1.

Table 1. Message construction of e-banking fraud prevention

Proactive communication through KM and sharing	Message constructions on e-banking fraud prevention	Number
Videos	Cybercriminals are watching you ATM card fraud Carrying cash safely Phishing/vishing Sarah adventures videos	6
Campaigns	We need your help! Small favor, big return (May 2018) Banking Industry launches protection of personal information campaign (May 2017) Keep your money safe this Festive Season (November 2017) SABRIC warns consumers to beware of phishing and malware (June 2016)	4
Media releases	SABRIC Report: Credit card fraud has risen by 1% (April 2018) SABRIC lauds special meeting on cash-in-transit heists (May 2018) Release on card fraud stats 2017 (April 2018) SABRIC & Nelson Mandela University join forces in the fight against cybercrime (March 2018) Money matters matter (March 2018) Ponzi & Pyramid schemes (March 2018) Ngcobo station attack (February 2018) Be careful! Criminals are targeting your Stokvel payout this Festive Season (December 2017) SABRIC: Safe banking over the Festive Season (November 2016) Don't let criminals get their hands on your money – carry cash safely (October 2016) Get rich quickly? (September 2016) SABRIC cautions women to be alert on dating sites and social media platforms (August 2016)	15

Proactive communication through KM and sharing	Message constructions on e-banking fraud prevention	Number
	Wise Up and Watch Out for Schemes and Scams (July 2016) SABRIC encourages bank consumers to take care of their Cybersecurity (April 2016) You could be sharing too much personal information on social media, SABRIC warns (February 2016)	
Stay Safe (Security center)	Safe banking awareness (links to scams)	18

The video focuses mostly on warnings of cybercrime, ATM card fraud, cash safety and phishing/vishing. The campaigns tried to create awareness on a wide range of fraudulent activities, but also on the importance to protect personal information (identity theft), money safety and phishing and malware practices. From the 15 media releases postings on the website in the monitored period of time, the following types of messages were posted: safe banking (5), cybercrime/security (4), Get-rich schemes (2) and Cash-in-transit heists (2). This is graphically presented in Figure 2.

Figure 2. Types of messages in the media releases

From Figure 2 it is clear that prevention measures for safe banking were most prevalent, especially to keep money safe, followed by cybercrime and security where customers are warned about identity theft, the use of social media and dating sites (in other words to keep personal information safe). One example is that of the CEO of SABRIC who said in their latest media release: "Criminals will use these techniques in the hope of tricking recipients into disclosing their personal information on bogus online platforms or on spoofed websites. And all it takes is a few duped individuals to make phishing a profitable business for cybercriminals." SABRIC (2018). In terms of the 'stay safe' website, each of the scams is identified and each of these links provides detailed information on these scams and safety tips on how to prevent fraud.

Table 2 presents the results in terms of the three typologies of knowledge management to ensure that knowledge sharing takes place.

Table 2. Data analysis in terms of the typologies of knowledge management

Typology	Components/ criteria	Variables/results
Knowledge acquisition	Technical (website): data gathering and mining knowledge construction	Wise up. Watch out. (important information on SABRIC) Beware! Skelm is lurking this Festive season. Stay Safe – keep your money safe with these tips Detail information on the banking scams and fraudster statistics All third-party frauds have visual links and each cover a broad spectrum of fraud and safety measures. Messages constructed based on existing data and fraudulent transactions Information not yet prevalent: cryptocurrency fraud and 'SMishing' but has been included in a new media release
Knowledge transfer	Proactive Organizational Communication (messages): create direct real-time interactions sharing of information	Communication through the creation and sharing of detailed messages through direct real-time interactions on the home page Real examples of scams with visual links to give proactive communication messages and information on each of the following scams Card fraud Details of what counterfeit card fraud is What is 'card not present' (CNP) fraud? Lost card fraud Stolen card fraud Account take over fraud Not received issued card Important tips to avoid card fraud ATM What is ATM's (card skimming, swapping cards, ATM shoulder surfing and trapping of cards inside ('Lebanese' loop) Do's Don'ts Tips on protecting your pin Tips for protecting your cash Telephone numbers for reporting ATM-related incidents Internet banking Details on how to using pin and password correctly Make sure you've logged on to your Bank's authentic Internet banking website Is your own PC secure? Tips for using your card safely on the Internet Cell phone banking The safe way to use it as it relies on encrypted SMS messages or secure WAP connections Important notes 419 Scam What is it? Some indications that this could be a 419 scam (if it sounds to be good to be true it is) General trademarks of a 419 scam

Typology	Components/ criteria	Variables/results
		What you should do when you received a 419 scam through letters, emails, fax Changing banking details scam: Definition and discussion of the scam How to prevent becoming a victim of this type of fraud What can you do as a victim? Identity theft What it is What can criminals do with your personal information (assume your identity to access funds, acquire retail or bank accounts, defraud insurance, medical aid and UIF) What is personal information (ID, passport, driver's license, salary advice, municipal bill or other account statements, bank statements) Deposit and refund scams How does it occur? How to protect yourself Money laundering (limited information) Tips to safeguard yourself Carrying cash safely Tips to avoid being a victim of cash robberies for individuals, business, saving clubs and 'stokvels' Phishing What it is(emails) Modus operandi ('spoofed' website) Tips to avoid becoming a victim E-mail hacking Symptoms of a possible compromised email address (spams, unknown emails, etc.) What to do if you suspect your mailbox has been hacked How to prevent email hacking Cybercrime What it is (criminal act) Tips to avoid cyber-crimes Cybersecurity Mobile devices and tablets Software management Connectivity Behavior (tips) Schemes and scams Fraudulent change of bank account details scam (modus operand and awareness tips for consumers) Deposit and refund scams (modus operandi and awareness tips) Dating and romance scams (modus operandi, how victims get defrauded and how to avoid being a victim of online dating scams? 		Telephonic technical support scams (modus operandi and awareness tips) Get rich quick scams (what it is, modus operandi and signs to look out for) Safe banking awareness Mobile banking (prevalent modus operandi through social engineering tactics to trick victims to disclose mobile login details and then conduct a fraudulent SIM swap on this number and safety tips) Internet banking (prevalent modus operandi through phishing using malware to infect the victim's computer and gain sensitive information and passwords and safety tips) Cheques (prevalent modus operandi and safety tips) – see cheque fraud Bank cards (prevalent modus operandi by stealing genuine cheques and dip them into chemicals to removing writing or forge signatures on blank cheques; and tips for cardholders) ATMS (prevalent modus operandi and skimming – mounted, Lebanese loop, card swapping – and safety tips) Money laundering (prevalent modus operandi to avoid access to pay funds into customer's accounts through rewards and tips to safeguard yourself) Festive season scams (prevalent modus operandi to trick customers and safety tips) Vishing What it is (fraudster phone as a bank official or service provider using social engineering skills to manipulate them into disclosing confidential information)) Tips to protect yourself Cheque fraud What it is (cheque interceptions, substitution of genuine issued cheques with fraudulent ones and cheque washing) Look out for ... Tips to protect yourself What else to do to keep cheques safe The way you make your cheque payable can protect you How does crossing your cheque protect you? When accepting a cheque make sure ... Be cautious when you notice the following on a cheque ... Important notes Detailed messages created. Sharing of information through examples of fraudulent emails and direct real-time interactions.
Knowledge assimilation	Human (customer):	The homepage includes warning of fraudulent transactions. Prominent and visual links to all scams

Typology	Components/ criteria	Variables/results
	methods/procedures to link customers informal/formal setting for interaction company practices to address the crisis context	Media and News (press releases) Partners Stay safe (updated details on each fraudulent banking action and latest scams) Contact details General security messages in informal and formal settings. Detailed methods, practices, and procedures provided to customers to ensure security in informal and formal settings. A clear indication of practices to address both proactively and reactively fraudulent online transactions. Clear contextualization of messages

Findings and critical analysis of results

A critical analysis of the results of the proactive communication and knowledge sharing on the website of SABRIC to prevent fraudulent e-banking transactions revealed that the contents of the website closely applied the three typologies of knowledge management identified in the literature review. It is indicative that effective and proactive communication through KM can contribute to manage and control messages for the prevention of fraudulent e-banking transactions to ensure e-trust, loyalty, e-security and a positive reputation of the institution to enhance customer relationships. A summary of the main results in terms of the three typologies are presented as follows:

Knowledge acquisition was evidenced through providing instructing information on the website to customers on how to keep money safe with detailed information on the banking scams and fraudster statistics, visual links to each spectrum of fraud and safety measures, accurate information and messages based on existing data and fraudulent transactions on how to take pro-active action based on data gathering and mining, as well as knowledge construction. Three main types of messages that were obtained through data mining and constructed were noticeable: basic facts about fraudulent e-banking transactions; updating of existing information and facts, and provision of new information and messages to prepare customers for what to expect and how to react to it. This was verified by the establishment of a 'Stay Safe' security web site and detailed and visual links to cover the broad spectrum and context of fraudulent e-banking transactions.

Knowledge transfer was apparent from the move into creating and adjusting the communication messages once the immediate impact of the fraudulent e-banking transaction wears off by posting various messages and linking customers to websites for direct real-time interactions and by sharing information to ensure them of the safe and secure use of online transactions. Examples of possible real-time fraudulent transactions on each link were explained in terms of the modus operandi of criminals, what the scam is, how customers should prevent or address it if it happened, numerous safety tips, etc. to ensure transfer of this knowledge to the customer.

Knowledge assimilation was substantiated through the control and management of the messages in the pre, present and post stages of fraudulent e-banking transactions. This is evidenced in the following: the home page includes warnings to fraudulent

transactions, provide prominent and visual links to all scams, access to media and news (press releases), details on the partners, easy access to the main link to stay safe (updated details on each fraudulent banking action and latest scams), contact details, general security messages in informal and formal settings, detailed methods, practices and procedures provided to customers to ensure security in informal and formal settings, clear indication of practices to address both proactive and reactive fraudulent e-banking transactions with a clear contextualization of messages. These links not only presented methods and procedures to ensure safe e-banking transactions but also provided informal and formal settings for interaction (for example Facebook and Twitter although it was not included this study), stating company practices to address fraud and the context in which it is managed and controlled. This was corroborated through linking of customers to 'Stay Safe', general security messages (formal through media releases or informal through videos), and detailed methods, practices and procedures to address it proactively and if needed, actions to correct actions reactively.

The results of the analysis indicated that the bank definitely complied on all accounts and that most of the criteria of each typology of the knowledge management paradigm were adhered to. Furthermore, it is argued that due to proactive control and management of messages, customers were assured through various means of the safe and secure use of online transactions. Within each of these typologies, the 'expert' initiated messages to react, warn and update customers (proactively and reactively) and included real-time examples and the modus operandi of fraudulent emails, SMS's and scams. The messages were made available quickly and immediately after incidents of fraudulent e-banking transactions became evident (whether through asynchronous media like media releases, links, emails, etc. or synchronous media like Facebook, Twitter, etc.), were factual, and assured customers of security and safety measures applied by the bank throughout. This is in line with the arguments based on the literature review that initial response to fraudulent e-banking transactions should be quick, consistent, open, sympathetic and informative to create awareness and educate customers on e-security and to enhance customer relationship through the three typologies of KM to ensure knowledge sharing. Furthermore, one main link to the 'Stay Safe' was (and still is) evident, visually prominent and easy assessable on the home page. This 'Stay Safe' had 18 main links to each of the fraudulent e-banking scams and fraudster activities with the main aim to 'keep your money safe'. Although the fraudulent e-banking transactions scam (SMishing) was not included on this link, it was mentioned in the link to media and news where they provided the latest press releases on new scams and/or other e-security knowledge and information. For example, the latest press release said: "SABRIC would like to remind bank clients to always be on the lookout for Phishing, Vishing and SMishing scams ... to make conscious decision to institute good habits to avoid becoming victims ..." (SABRIC, 2018, p.1). Although 'cryptocurrency' (like Bitcoin) was not prevalent either, it could partially be considered under 419 Scam which warns that 'if it sounds to be good to be true it is'. However, due to the vast number of these scams, research is ongoing.

From the above, it is argued that the website messages were organized around the main types of messages identified in Table 1 and if correlated to the typologies in Table 2, it is clear that overlaps exist which means that it is indicative that KM can be used as a theoretical starting point to manage and control the different types of messages to create awareness, educate consumers and share knowledge and information to ensure the prevention of fraudulent e-banking transactions and to enhance e-security and

customer relationships. Generally speaking, the opening website page of SABRIC not only reflected immediate and proactive communication on 'Stay Safe' of the 18 scams, but also provided a direct link to 'Who we are' which includes the staff, vision, values and mission statements highlighting the need to view crime as a shared responsibility and collective priority for customers and public-private partners which can be seen as a first step towards (co)liability; media and news (press releases, campaigns, downloads and videos); a link to 'Our partners' which include the four major banks who initiated this NPF, but also identified the 23 financial partners; and lastly a link to 'Careers' at SABRIC itself which is self-explanatory.

From the knowledge obtained about the indicators of encryption or secure online transaction systems, it can be argued that SABRIC can be seen as having a strong reputation and positive image because of the factual information on e-security and safeguard practices on the website. Messages varied from a general description of the scam and details on how to prevent becoming a statistic. Most of the information also featured in the media releases, thus offering multiple connections from dual locations on the website. Furthermore, visual links were established on each security website with detailed information on possible schemes and information on what to do.

From the above, it can be contended that the bank was consistently proactive, used frequent informative messages, included factual information and knowledge sharing messages to assist customers, provided contact details and assured them continuously of the safe and secure use on online transactions. The vision, values, and mission of SABRIC clearly indicate their commitment to crime prevention through proactive communication and the move towards shared responsibility and (co)liability. The use of the 'Stay safe' link is an example of proactive communication and knowledge sharing to reassure and warn customers of fraudulent e-banking transaction and e-security measures through knowledge management as a change agent. Furthermore, they assured customers that if they use the information on these links, there will be safeguards in place which will enhance e-security (e-trust and loyalty) to enhance customer relationships and SABRIC's reputation to act as perceived risk relievers. This could influence perceived risks and e-security positively from a knowledge management paradigm where the agents are regarded as 'experts' in the field who provides reliable and valid knowledge about indicators of encryption or insecure e-banking transactions contributing further to its reputation.

Finally, the most significant attribute was the identification of fraudulent e-banking transactions as a dangerous and real criminal activity and the importance of proactive communication to manage and control the messages in the social, cyber and physical worlds of customers. SABRIC maintained the same basic format of its web site and frequently updated the messages and links. Although the move towards (co)liability is prevalent, it is suggested that a clear policy is needed to apply it consistently and transparently. However, because the bank introduced new messages about the long-lasting effects of fraudulent e-banking transactions and the vast number of new scams, it can be argued that the bank did apply reactive communication in the acutest phase just after the scam became evident (González-Herrero & Smith, 2008, p.151).

Conclusion and implications

By undertaking a KM approach, the study examined proactive communication and knowledge sharing through KM to control messages on fraudulent e-banking transactions. Although this can often result in the construction of opposing viewpoints, it is argued that a way to ameliorate this tendency is to promote recognition of the scams to alleviate concerns about the safe and secure use of online transactions

Although the main limitation is that qualitative research through a single case with one institution was conducted, the findings of the study provide insight into the importance of proactive communication on the prevention of e-banking security to ensure continued and positive customer relationships. The next step is to develop a knowledge management strategy for SABRIC to address perceived risks, enhance customer relationships and ensure a positive reputation of the bank. It is recommended that further quantitative research be conducted to obtain a deeper understanding and accounts of the influence of control and management of messages on perceived risk, which was probably pre-eminent by Lee et al. (2013, p.870) who said: "The most influential construct among the KM practices is the knowledge sharing dimension".

SHOWCASING DIGITIZATION AS THE BACKBONE OF KNOWLEDGE AND SHARING ECONOMY IN ROMANIA

Shahrazad HADAD

The Bucharest University of Economic Studies
2-2A Calea Grivitei, Sector 3, 010731 Bucharest, Romania
Academy of Romanian Scientists
5 Splaiul Independentei, 05009 Bucharest, Romania
shahrazad.hadad@fabiz.ase.ro

Abstract. *By means of a case study, we are showcasing how digitization has reshaped the transportation industry concerning renting-like services. The evolution of mobility services starts from taxis, car renting, goes to ride-sharing and, ultimately, arrives at car-sharing services. The present paper will introduce an instance of car-sharing and renting service which is called Pony Car Sharing. Car sharing, house-sharing, equipment-sharing are all instruments of the sharing/network and collaborative economy, which has started to gain academic and practice traction, but all this would not have been possible unless for the existence of the Internet. The Internet is constantly empowering consumers all over the world by making them more knowledgeable and granting them access to make more informed decisions. The second part of the paper uses qualitative research and is dedicated to a case study that analyses Pony Car Sharing company, in the context of sharing and knowledge economy, from the business model canvas perspective: key partners, key activities, value proposition, customer relationship, channels, customer segments, revenue streams and costs. The findings reveal that there is no legislative support for the sharing economy and that implementing such a business model requires substantial efforts from the business owner. Nevertheless, investments in educating the customers are not expendable.*

Keywords: *digitization; knowledge economy; sharing economy; digital skills; business; impact.*

Introduction and literature review

According to Jansen (2017, p.2), we are dealing with a-yet-to-come Golden Age of Information that is characterized by the cheap (and sometimes, even free) knowledge transfers, need of customers to belong to (virtual) communities (serial networkers) and increased individualization embedded in the high customization demanded by customers. Ultimately, these elements create altogether “a fertile ground for unlimited innovation”, an innovation which can ideate economic, social, environmental and political types of value (Paunescu, 2014). On the other hand, in order to ensure there is a corresponding reaction to such requirements, organizations need to assimilate to their business strategies concepts reflecting authenticity, involvement, and innovation. The new emerging business models will reflect the use of non-linear intangibles giving rise to new thinking models and patterns (Bratianu, 2009, 2017a, 2017b, 2018).

Therefore, this tech breakthrough results in the redesign of organizational processes and structures that call for brand-new strategies to exploit other sources of competitive edge a company might possess. This paradigm shift is questioning the way current

businesses are being conducted and advances the adoption of new business models for ensuring sustainability. Empirically speaking, the importance of business models overrides the importance of industry classification indicators providing more reliable financial forecasts (Weill & Ross, 2004). Business models, beyond representing a useful tool for investors, lenders and other stakeholders, can be used by companies to provide insights on the results of IT applications (Hedman & Kalling, 2003) and to leverage technology in order to derive economic value (Chesbrough & Rosenbloom, 2002; Chesbrough, 2010). Hadzimustafa (2011) posits that higher levels of economic development can be attained with the involvement of highly qualified personnel and efficient technology transfers in the context of enhanced knowledge generation in both commercial companies, NGOs and umbrella organizations (Zbucheau et al., 2017, 2018). In the same vein, Johnson et al. (2008) investigate how different industries can be reshaped by new business models and stimulate growth.

We are witnessing a new era in which products and services come to be widely distributed via multiple channels. The network economy, as well as the knowledge economy, resorts to intangible resources such as knowledge and the emotional knowledge (Bratianu & Orzea, 2013) to find solutions to different problems, and transforms them into smart products and processes that require efficient use of resources and therefore increased sustainability.

Figure 1. Sigmoid-curve
(Source: Jansen, 2017, p.10)

In order for companies to maintain competitiveness on the local, regional and global market, Jansen (2017) has come up with Sigmoid curve tool (from traditional to “network economy”) (Figure 1) to assess the adequateness of companies’ current business models that can be found at the interplay of suppliers, customers and network partners.

Knowledge economy consists of the creation, distribution, and use of knowledge and information (OECD, 1996), and it represents one of the leading sources of wealth establishment (Vesela & Klimova, 2014). Powell and Snellman (2004) regard knowledge economy as “production and services based on knowledge-intensive activities that contribute to an accelerated pace of technical and scientific advance, as well as rapid

obsolescence" (p. 199). As opposed to traditional economy, the knowledge economy is characterized by a higher emphasis being placed on the intellectual capabilities than on tangible resources (Bratianu, 2011; Hadad, 2017a, 2017b, 2017c, 2018; Bejinaru & Iordache, 2011). Knowledge is a strategic resource (Bolisani & Bratianu, 2017) that plays an extremely important role in the life of developing countries (such as the case of Romania) and is contributing to the improvement of the local economy (Dima et al., 2018) inasmuch as innovative clusters can be a solution to the economic development of the same category of countries (Dan, 2011, 2012).

There are four components/pillars that underlay the knowledge economy: 1) An economic incentive and institutional regime (EIR) that provides good economic policies and institutions that allow for efficient mobilization and allocation of resources and stimulate creativity and incentives for the efficient creation, dissemination, and use of existing knowledge; 2) Educated and skilled workers who can continuously upgrade and adapt their skills to efficiently create and use knowledge; 3) An effective innovation system of firms, research centers, universities, consultants, and other organizations that can keep up with the knowledge revolution and tap into the growing stock of global knowledge and assimilate and adapt it to local needs; 4) A modern and adequate information infrastructure that can facilitate the effective communication, dissemination, and processing of information and knowledge (ICT) (Chen & Dahlman, 2005; World Bank, 2009, 2012). According to Tapscott (2014), the knowledge economy is a digital economy.

Now, that Digitization has become part of everyone's life and digital technology has altered most fields of activity and industries (Cao et al., 2018) such as transportation (Uber, Taxify), communication (all sorts of messenger applications and social media platforms), accommodation (Airbnb), medicine (telemedicine), production (3D printing), etc., it is clear that the tech disruption/destruction might have started from the very intersection of mobile phones, personal computers, and the Internet (Topol, 2013). One byproduct of digitization is the concept of a shared economy. According to World Economic Forum (2018), sharing economy is inviting economic actors (companies) to reassess and rethink their businesses and revenue models: focus on access rather than on ownership, design and turn products and services into actual experiences, and cater to the hyperpersonalisation need of the customer. As every new concept, sharing economy finds itself at the crossroads from a legal standpoint since very few countries have specially designed laws to foster it (Demailly & Novel, 2014). A crucial role in harnessing the sharing economy is played by the public authorities that, next to practitioners and researchers, can identify the most viable models and design methods to support them through: a) enhanced visibility and communication campaigns; b) fundraising and incubators; c) adapting regulations to embed new models (idem); d) implement best practices.

Research methodology

The present paper employs mainly qualitative research. The first part sets the theoretical ground for the knowledge economy, sharing economy and digitization, whereas the second part showcases how a 21st-century car sharing rental company works. The main objective of the paper was to illustrate how a company works within a newly established framework and which are the challenges it faces. We employed qualitative research since the phenomenon that is being investigated is a very recent

one and there is not enough available data in order to measure its spread and conduct quantitative research. Therefore we opted for an in-depth analysis of a company that acts in the sharing and knowledge economy in order to gain more insight on how such a company works, which are the challenges it faced throughout its existence and illustrate its business model through the lenses of the business model canvas designed by Osterwalder and Pigneur (2010) and we will address the following: key partners, key activities, value proposition, customer relationship, customer segments, key resources, channels, revenue streams, and cost structure. The paper uses both primary and secondary sources of information. The primary sources are represented by the small confirmatory interviews conducted with the kind help of two employees: Ms. Diana Otelea (Brand Manager) and Ms. Mihaela Simionescu (Customer Service Coordinator); whereas the secondary sources of information came from the official website of the company, official company documents, and other press related articles. The main limitation of the paper is that it illustrates only one stance of sharing and knowledge economy and that it does not allow for further inference.

Case study: Pony Car Sharing

Company description

Pony Car Sharing is a 100% Romanian private capital owned company, founded in 2015 as the first and biggest car-sharing service in Romania. Since it activates in the car sharing service, the company represents an actor in the sharing economy.

Pony Car Sharing was set up following the example of the car rental CAR2GO German company headquartered in Ulm, that later extended in Europe and the United States (www.car2go.com). Pony Car Sharing is a business-to-consumer (B2C) car-sharing company in which customers can rent the vehicles the company owns.

The company has 38 employees and a turnover that classifies it as a small business. Since it started, the company has not incurred any profits as it can be inferred from Figure 2. This is a normal consequence of an investment in assets that is to return in several years. The company started its activity in Cluj, and later, in 2017, it began to set up an additional headquarter in Bucharest.

Figure 2. Pony Car Sharing – Turnover (blue) and Net Profit (red)
(Source: Lista firme, 2018)

The company owns a fleet of 80 cars in Cluj-Napoca and 40 (going on 80 by the end of 2018) cars in Bucharest (VW, Mercedes, Smart fortwo, Smart forfour, Mini One, BMW i3; both on gas and electric; manual or automatic) and they are uniformly distributed over the surface of the two counties. The rental services of the company are available through the GetPony app (which was improved to services such as book/reserve a car, fuel the car or buy prepaid unit packages to get a different kind of discounts). The fleet of the company is eco-friendly (electric cars and EURO 6 cars).

As we are discussing the need of hyperpersonalisation of the customers, the company insisted on getting customer feedback on how to improve the services, app or how the company works and embedded the feedback in the new offers.

The services of the company can very easily be accessed. The customer needs to download and install the GetPony app which is freely available on GooglePlay and AppleStore, register their ID and driver's license, provide a valid bank account and, then, they can rent whichever vehicle is suited for their own needs. The car gets unlocked with the help of the app, and it can be picked up from a location on the map, driven all around the country and dropped off at a different location within the designated operating area.

Business model canvas

The business model canvas was designed by Osterwalder and Pigneur (2010, 2013) and represents a strategic management planning tool meant for developing and documenting new or existing business models. The present section will develop the main building blocks of the business model canvas by portraying the case of Pony Car Sharing company, with a specific focus on key partners, key activities, value proposition, and customer segments. The elements of the canvas are interconnected and, at times, they might be overlapping.

Key partners. This section describes the network of partners that the company has in order to optimize the business model, reduce the risk or acquire resources. Pony Car Sharing has initiated a significant number of partnerships belonging to entertainment, culture and lifestyle brands in order to attract customers. The key partners or network is one of the most important sections of the business model canvas in the case of knowledge and sharing economy business because it accounts for the need of the customer to belong to a network or community as identified in the literature review.

The first and most important collaboration was the one with the three famous music festivals: UNTOLD, Electric Castle and Mioritmic. The partnership took the shape of a barter in which the company's fleet was branded with the logos of the festivals and a special print, there were organized contests in which the customers could win free entry to the festivals or Pony discounts, and VIP parking spots for the company's fleet (Simionescu, 2018). Additionally, pop-up prizes were placed strategically in the cars for the users to find: portable speakers or picnic blankets. Another marketing move that was taken was to display a Pony car inside the festival operating area and turn it into a photo booth.

Among the various initiated collaborations was the one developed with TedX when Pony Car became the official transportation means for the invited speakers and TedX conference tickets were offered for Pony customers through contests. Moreover, all the

conference participants were offered discount vouchers. A similar collaboration was developed with TIFF (Transylvanian International Film Festival), the difference being that during the breaks, the cinema would run a short Pony Car commercial. The company concluded other valuable partnerships with the fashion industry (V for Vintage), Meron coffee shop (to be associated with a routine people have), and with a yoga studio. All these partnerships could be categorized as strategic alliances between non-competitors which resulted in invaluable increased brand awareness, attracting new customers to try the service of the company, acquire new customers and it fine-tuned the company to the adjacent needs of the customers.

Key activities are the most important things a company does to ensure the functionality of the business model. The main key activity of Pony Car Sharing is renting cars to natural persons (B2C) and they plan to include a Business-2-Business (B2B) service as a reaction to the various requests they got from different corporations requiring such services for their own employees under special terms and conditions. This new activity might prove to have a positive impact on the traffic in Bucharest and on the levels of pollution.

Value proposition has the role to describe the products the company offers that create value for a specific customer segment. The best description of Pony Car Sharing value proposition is their headline: "Rent your car straight from the street, using your phone. Without any contract. Without warranties. Without extra charges", because it underlines the advantages it has as compared to the competitors. Pony Car Sharing is the first car sharing service in Romania and it has the first mover advantage. It satisfies the need for mobility of the customer by helping him/her share, contributes to traffic jam reduction, and pollution. For the company, the Internet of Things innovation allows for the transfer of data through the Internet and Bluetooth technology by means of a device (smartphone or tablet) and the company fleet that has tracking boxes installed on every car which control the main operations. The app receives data from the tracking box constantly updating the map with the location of the cars, fuel levels, kilometers, reviews of last customers, color and type of transmission in order to keep the customer updated in real time. The services are available to customers under two conditions: a) the customer should be at least 21, and b) he/she should have their driver's license for at least 1 year. These two conditions were commonly agreed with the insurance company.

Customer relationship Pony Car Sharing establishes both personal and automated relationships with the customer with the purpose of acquiring and retaining new customers. The Customer-service department is in charge of the relationship with the client that is maintained through e-mail, phone and post office. *Customer segments* The main customer segment of the Pony Car Sharing is represented by Millennials who are permanently up-to-date with any new tech releases, active and curious, with a different attitude regarding the sense of ownership as compared to past generations, keen on urban mobility, not owning a car. Millennials are also the early adopters of the company's services.

Key resources are in this case tangible resources (the fleet of cars in Bucharest and Cluj-Napoca), and intangible resources (the app and data it generates). Other key resources include the human capital that plays a crucial role in interacting with the customer and helping to acquire him/her. *Channels* describe how the company communicates with and reaches its customer segments to deliver the value proposition. The company

reaches its customers through the previously described app by means of user accounts; therefore, Pony Car Sharing does not use any intermediaries in relation to its clients.

Revenue streams are established in tight connection to the key activities and each of them should be able to generate a source of revenue. The company tries to acquire and many as possible recurring clients by means of subscriptions and price discounts and Pony units. For example, the services can be acquired by minute, day, subscription, etc. *Cost structure* The main costs incurred by the company were related to initial investment, the acquisition of the fleet and its maintenance, fuel, salaries, development, and maintenance of the app, insurance, etc.

Conclusions and implications

The present paper has contributed to the existing literature in the field of knowledge, knowledge management, digitization, and business models. In the first part, it has laid the theoretical framework of the business case study to be assessed in the practical part of the research. The purpose of the paper was to showcase an instance of the knowledge economy business model in the context of digitization in Romania. The findings revealed that Pony Car Sharing represents an example of good practices. The present paper could help legislators develop a framework for the knowledge and sharing economy so that this and similar companies could benefit from specialized support consisting in free parking lots or investment in infrastructure for electric cars, and the list may continue. One lesson learned is that partnerships between non-competitors could have a positive influence on increasing brand awareness by associating with different well-established brands. A different challenge from the legislation was to educate the customers and provide them with accurate information in order to understand how the company works, what the service means, which are the benefits of using the service, and which are the major differences between the company services and traditional car rental service.

INTELLECTUAL CAPITAL REPORTING – A LONGITUDINAL STUDY OF MICROSOFT ANNUAL REPORTS 1998-2017

Łukasz BRYL

Poznan University of Economics and Business

Al. Niepodległości 10, 61-875 Poznań, Poland

lukasz.bryl@ue.poznan.pl

Abstract. Many empirical studies concentrate on the intellectual capital reporting practices around the world. Studies confirm the rising importance of intellectual capital disclosure and its key categories by the publicly listed entities in promoting corporate governance and better flow of information for the stakeholders what subsequently improves general stock market transparency. Although there is a plethora of studies of intellectual capital disclosure in terms of: practices, techniques, methods and international comparisons there is a gap among prior studies in respect of longitudinal research. This gap derives partially from the fact that there are not that many publicly listed companies that report extensively over a longer period of time. As a consequence, main motivations of undertaking the research in the proposed paper are: the importance of the topic and the above-mentioned gap in the literature. The aim of the paper is to examine the extent and quality of intellectual capital reporting of one company (Microsoft) over a period of 20 years from 1998 to 2017. In order to enable comparability with previous studies, proposed research was based on the framework initially developed by Guthrie and Petty (2000). Achieved results suggest that IC disclosure during 20 years is rising in terms of extent and quality, what is observed within all of IC categories, however the trend is relatively weak, due to large fluctuations (mostly in the case of relational capital). The most significant growth (despite variations) was observed in terms of relational capital, which appeared also to be the most frequent IC item reported, mostly due to: brands identification and depiction, corporate reputation and proactive customer approach, including their perception by the firm in the context of shaping the future strategy. Structural capital was named as second most often disclosed IC category, mostly due to intellectual properties descriptions. Human capital information contained mostly data on total employment, remuneration and employee stock option plan. In addition, IC reporting was mostly found in factual (verified) form rather than narrative (unverified). The research methods adopted for this study are: content analysis and tools of descriptive statistics. As a source of data annual reports were utilized.

Keywords: Intellectual capital disclosure; intellectual capital reporting; publicly listed companies; stock exchange; annual report.

Introduction

The notion of intellectual capital (IC) is widely recognized and analyzed. Although there have been numerous studies conducted on IC measurement and management, still there are certain doubts in the literature, especially in the field of IC reporting. Theory suggests that there could be distinguished three incentives for companies to disclose their IC. First, to be better perceived by the labor market and hence more attractive to individuals with higher skills and experience. As a result, companies may gain in the long term competitive advantage because of better human assets employed

(Bukh, Nielsen, Gormsen & Mouritsen, 2005). Second, to help the companies to focus on certain business areas because of reporting it (Stewart, 1997). And third, enterprises that disclose their IC could provide more insight into the firm and thus resolve uncertainty what may lead to the share price increase (Edvinsson, 1997; Lev, 2001).

The aim of the study is to analyze the extent and quality of IC reporting on the sample of one of the largest IT company (Microsoft) within a 20-years period of time. As Habersam, Piber and Skoog (2013) state, developing more insights into IC reporting practices is relevant because, it can show how content and structure of IC disclosure changes over time and organizational routines are being reshaped. Moreover, as argue Guthrie, Ricceri and Dumay (2012) there is still a place for practice-based research on technical and social processes organizations use in practice to construct disclosures. Proposed study is unique in this sense, as most of the research of IC relates to no more than five years, so there is an urgent need to capture the IC reporting practices in business entities over a longer period of time. This approach is not always possible due to numerous reasons (the most important one is lack of publicly available and reliable data). However, the study by Campbell and Rahman (2010) on the sample of Marks & Spencer provides an insight into the IC disclosure of British retail company over 31 years. Proposed study in this paper is based on the assumptions and methodology utilized by Campbell and Rahman (2010). Chiucchi (2013) points out that the findings from case study help understand how enterprises introduce IC accounting processes that internally mobilize IC. In fact, proposed study is a case study research on IC disclosure.

Consequently, the research question being asked is:

RQ: What is the extent and quality of IC disclosure by Microsoft during 1998-2017?

The research methods adopted for this study are: content analysis and tools of descriptive statistics.

The structure of this paper is the following: section 1 is introduction, section 2 provides the literature review on IC and prior research. Section 3 sets out methods used in the study. Section 4 outlines the results and discussion which is followed by section 5 pointing to conclusions and limitations of the study, along with the future lines of research.

Previous studies on IC disclosure

Early IC disclosure research focused primarily on establishing definitions, IC classifications and reporting frameworks (Sveiby, 1997; Bontis, 2003; Goh & Lim 2004). Once established, studies started to concentrate on the extent and quality of IC disclosure (Bontis, 2003; Xiao, 2008; Yi & Davey, 2010; Singh & Kansal, 2011), factors influencing IC reporting (Bozzolan, Favotto & Ricceri, 2003; Pablos, 2003; Wang, Sharma, & Davey, 2016) and effects of IC disclosure (Guimon, 2005; Dumay & Tull, 2007; Gerpott, Thomas & Hoffman, 2008). However, as suggest Cuozzo, Dumay, Palmaccio and Lombardi (2017) research on IC disclosure was maturing up until 2012. Between then and 2017, only two new models have been proposed (Abeysekera, 2013; Bini, Dainelli & Giunta, 2016). One of them deals with integrated reporting (Abeysekera, 2013), which provides a new opportunity to understand the interplay between intellectual capital and physical resources what is often missing in IC studies. Melloni (2015) points that integrated reporting is beginning to receive much traction in IC disclosure research.

In turn, longitudinal studies on IC reporting among firms are relatively rare and do not provide unambiguous conclusions. Research by Bukh et al. (2005), Sujan and Abeysekera (2007), Abeysekera (2008), Kamath (2008), Sonnier, Carson and Phillips (2008), Oliveras, Gowthorpe, Kasperskaya and Perramon (2008), Striukova, Uneman and Guthrie (2008) and De Silva, Stratford and Clark (2014) state that there is a growing trend in IC disclosure among companies, however its magnitude differs according to the study. In turn, Firer and Williams (2005), Singh and Kansal (2011), Mat, Hooper & Olesen, (2012), Dumay (2016) and Sharma and Kaur (2016) found that in fact there is no growth of IC reporting in the longer period of time or there can be even observed a negative trend in the extent and quality of IC reporting over years. Above-mentioned studies have been conducted mostly in developed countries: Denmark (Bukh et al., 2005), USA (Sonnier et al., 2008), Spain (Oliveras et al., 2008), New Zealand (De Silva et al. (2014) and Australia (Sujan & Abeysekera, 2007). Some studies analyzed IC reporting practices in developing nations, such as: Sri Lanka (Abeysekera, 2008) and India (Kamath, 2008; Sharma & Kaur, 2016). Most IC content was disclosed in narrative form, whereas the predominantly reported IC component appeared to be relational capital. However, it should be noted that among these studies there has not been utilized a unified research framework, hence cross-study comparability causes significant obstacles. Moreover, another important shortcoming of them is a relatively short period of analysis (lack of longitudinal observations).

Methodology

Sample selection

Microsoft, a well-known global IT company has been chosen for the study. There are two reasons behind that. First, Microsoft is a company which is intuitively associated with high IC level, hence its reporting practices should be studied. However, to the best author's knowledge, there has not been conducted any analysis of this kind on Microsoft so far. Second, as the aim of the research was a longitudinal study of IC reporting, Microsoft is one of the few enterprises to provide necessary documents covering required period of time.

Utilized source of data

The research compares the annual reports issued by Microsoft between 1998 and 2017. Abeysekera and Guthrie (2005) stated that annual reports are adequate tools to measure and compare IC between enterprises, however, some authors claim that the relevance of annual reports as data source is diminishing and they suggest to uncover new and interesting sources, such as IPOs prospectuses or social media activity (Krippendorff, 2013; Garanina & Dumay, 2017; Pisano, Lepore & Lamboglia, 2017). This approach is understandable, as Dumay (2016) and Schaper, Nielsen and Roslender (2017) found companies often abandon dedicated IC reports and resign from disclosing IC in annual reports. However, as the proposed study is a longitudinal insight into IC reporting practices, annual reports were the only media capable to contain historical data. For this reason, other possible sources of data on IC, such as: CSR or Integrated reports had to be excluded due to not long enough existence. Similarly, IPO documents and others (news, press releases) are created only intermittently. In addition, corporate

websites are not suitable for the nature of longitudinal study. As a result, annual reports were chosen as the most appropriate documents for this study.

Method

Content analysis was adopted as a research method. Content analysis is defined as a technique for gathering data (Abeysekera, 2008). The aim is to codify qualitative and quantitative data into pre-defined categories in order to receive quantitative scales of different levels of complexity (Abeysekera, 2008; Dumay & Cai, 2015). Moreover, content analysis is a desk-bound activity with easy access to data and, because it involves mainly research time, it is cost effective (Ousama, Fatima & Hafiz Majdi, 2011). Moreover, thanks to technology more state-of-the-art research processes can be developed, so more volumes of text can be analyzed, which adds to the reliability and quantitative generalization of findings (Dumay, 2014). However, it should be mentioned that content analysis has some limitations. Dumay and Cai (2014) identified three fundamental problems: the subjectivity of disclosures, their unit of analysis and their weighting/quality. Another major problem is the interdependence on companies (enterprise willingness) to report certain items. Moreover, there also has to be the assumption made that information provided by the companies are reliable. According to Dumay and Guthrie (2017), because of information asymmetry associated with agency theory, managers will normally keep valuable IC information secret unless it benefits them economically. However, despite these arguments, according to Guthrie and Petty (2000), Schneider and Samkin (2008) and Yi and Davey (2010) content analysis is perceived to be empirically valid in social sciences, intellectual capital disclosure and in the reporting fields of accounting research.

A coding spreadsheet was created and information on IC was introduced. Double check of coding was employed to eliminate coding errors.

IC reporting framework

Due to the two reasons: comparability with previous studies and subjectivity of the content analysis, IC reporting framework initially developed by Guthrie and Petty (2000) was adopted in this study, which has been widely recognized and in many studies utilized (April, Bosma, & Deglon, 2003; Goh & Lim, 2004; Steenkamp & Northcott, 2007). Based on the framework, IC is captured in three major categories (structural, relational and human capital) and 17 sub-categories (six sub-categories within structural capital and relational capital and five within human capital). Detailed presentation, including indicators of each of the sub-category has been shown in table 1. Some indicators were adjusted to the specifics of the industry of the studied firm.

Table 1. Categories and definitions of intellectual capital reporting
(Source: Campbell and Rahman, 2010)

Categories	Indicators
Structural capital	
Intellectual properties	Patent, Trademark, Copyright, Internet domain name, Design
Corporate culture	Vision, Mission, Code of ethic, Code of conduct, Code of practice, Principles of operation

Categories	Indicators
Management philosophy	Create value to shareholders, Sustain growth, Listen to customer, Protect environment and Caring society
Management and technological process	Control stock, Quality control, Performance appraisal
Information and networking system	Computer network, database, software, network, hardware, intranet, server etc.
Infrastructure	Portfolio of properties, stores modernization and refurbishment, floor extension, machine, plant
Relational capital	
Financial relationships	Relationship with shareholders, bankers and other fund suppliers
Brands	Brand, Sub-brand, Range of product and services name, Market shares, Product awards
Customers	Customers named, Customer loyalty, Customers trust, Customers feedback, Customers services, Customer satisfaction, No. of customers, Customers segment Customers convenience such as better software
Distribution channel	Supply chain, Business network, Development new stores across regions, Delivery system, Marketing and advertising, Carry out market research, Online selling, Web catalogue, Promotion activities/strategies
Business partnering	Franchising, Licensing, Collaboration, Outsourcing, Suppliers, External expert/consultant, Government, Local authorities, Media/press
Corporate reputation	Company name, Sponsorship, Community involvement, Environmental protection measures, Social responsibilities. Any activities that could raise company name
Human capital	
Employees	Employee profile, Employee equity, Equal opportunities, Employee safety, Employee relationship, Employee representation, Employee welfare, Employee recognition, Compensation plan, bonus, better pay, Duties and responsibilities, Employee good attitude, Employee morale
Training	Vocational development, Career development, Induction program, In house training, Recruitment, Employee assistance program, Continuing education for employee, Any state of being trained
Education	Bachelor, Master, PhD, Professional qualification
Work related knowledge	Seniority, Experience, Expertise

Categories	Indicators

Unit of analysis

First step of the study was the extent of IC disclosure by category and sub-category. In order to preserve comparability with previous studies, mostly with the study by Campbell and Rahman (2010), this research was based on the analysis of themes including IC information. A theme, according to Holsti (1969), is a single assertion about some subject and the most useful unit of analysis. Themes are not bound by grammatical unit such as word, sentence or paragraph but rather they refer to clusters of words with different meaning or connotation that, taken together, refer to some theme or issue (Weber, 1990). Theme approach not only enables researchers to better capture the IC content, but also eliminates the risk of misclassifying given information.

To better reflect coding practices employed in this study following sentence has been used as an example:

"We invest in a range of emerging technology trends and breakthroughs that we believe offer significant opportunities to deliver value to our customers and growth for the company." (Microsoft annual report 2017, p. 20)

Because of the adopted Guthrie and Petty (2000) framework this sentence was coded as holding two separate IC sub-categories.

"We invest in a range of emerging technology trends and breakthroughs"

was coded as reporting about innovation which is part of human capital, while

"...that we believe offer significant opportunities to deliver value to our customers and growth for the company."

was perceived as a comment about customers' convenience which is a matter of relational capital.

Such coding practices required more effort, however are in line with the previous studies and enable deeper IC disclosure analysis.

IC reporting quality

Second step of the study was the assessment of IC reporting (quality of IC disclosure). Among different approaches utilized in many studies this research, similarly to Campbell and Rahman (2010) adopts two-dimensional IC disclosure quality evaluation, meaning that IC reporting can be classified as: narrative or factual. Narrative description refers to the managerial perception and tends to be expressed in terms of awareness, belief, cognition, estimation or sense-making (Mezias & Starbuck, 2003). Perception disclosures are unverified and possibly unverifiable (Campbell & Rahman, 2010). In turn, factual information is typically expressed as something that has actually happened or something that is expressed in a proven or verifiable manner. Beattie and Thomson

(2007) argued that information is considered as fact if it is verifiable. Consequently, following sentence was coded as perception (narrative).

"It is equally important to evolve our culture - becoming more customer-obsessed across all our products, focusing on leading indicators like usage, and ensuring Microsoft continues to be the best place for smart, curious people to do great work." (Microsoft annual report 2014, p. 3)

At the same time following sentence was coded as factual information.

"During fiscal years 2014, 2013, and 2012, research and development expense was \$11.4 billion, \$10.4 billion, and \$9.8 billion, respectively. These amounts represented 13% of revenue in each of those years." (Microsoft annual report 2014, p. 13)

Results and discussion

Table 2 depicts the results of the study in terms of the extent of the long-term disclosure of IC in annual reports with the categories breakdown. A total of 2637 themes have been captured in 19 annual reports.

Table 2. Intellectual capital reporting themes (Source: own study)

Year	Structural capital	Relational capital	Human capital	Total
1998		58	12	96
1999	28	80	22	130
2000	19	81	18	118
2001*	N/A	N/A	N/A	N/A
2002	28	94	17	139
2003	37	86	15	138
2004	22	94	24	140
2005	27	87	27	141
2006	28	88	28	144
2007	28	97	28	153
2008	28	105	27	160
2009	22	99	28	149
2010	19	73	35	127
2011	25	88	31	144
2012	31	65	28	124
2013	26	69	22	117
2014	26	82	23	131
2015	36	93	22	151
2016	36	107	27	170
2017	43	128	27	198
Total	535	1641	461	2637
Share	20,30%	62,20%	17,50%	

Notes: *Due to technical problems annual report for 2001 was not available on the company website.

The most often reported IC category in all consecutive years was relational capital (1641 identified themes in total), followed by structural capital (535 themes) and human capital (461 themes). During 1998-2017 there was observed a rising trend in IC disclosure. These findings, in terms of growing extent of IC disclosure and relational capital as the predominant category of IC are in line with previous studies by Bukh et al. (2005), Sujan and Abeysekera (2007), Abeysekera (2008), Kamath (2008), Sonnier, Carson, and Phillips (2008), Oliveras et al. (2008), Striukova et al. (2008) and De Silva et al. (2014). However, Campbell and Rahman (2010) observed more rapid IC disclosure increase (106% growth in the case of Microsoft and 675% in the case of Marks & Spencer).

Microsoft relational capital was mostly disclosed in the form of: brands, customers' orientation, corporate reputation and distribution channels. Second most reported IC theme was structural capital, followed by human capital, which appeared to be the least disclosed IC category, which stays in contrary to almost all previous studies, with the only exception of Bozzolan et al. (2003) on the sample of Italian firms. However, latest study referred to single year only. Changes of IC categories during the studied period are presented on figure 1.

**Figure 1. ICR categories trend
(own study)**

Largest growth was observed in the case of relational capital; however, the trend was not linear. Significant decreases were observed in 2010 and 2012. Similar phenomenon was found in the case of structural capital disclosure (in 2004 and 2010). Human capital reporting longitudinal changes could be described as moderate. Most often reported IC sub-categories with the division into decades was shown in table 3.

Table 3. Top five most frequently reported IC sub-categories (Source: own study)

Rank	Period 1 1998-2007	Period 2 2008-2017
1	Brands (RC)	Brands (RC)
2	Intellectual properties (SC)	Corporate reputation (RC)
3	Customers (RC)	Intellectual properties (SC)
4	Corporate reputation (RC)	Employees (HC)

5	Employees (HC)	Customers (RC)

In general, reported IC sub-categories were mostly part of relational capital. In period 1 (1998-2007) and period 2 (2008-2017) information about brands was the most frequent item disclosed, followed by intellectual properties (period 1) and corporate reputation (period 2). This is understandable, as Microsoft is a technological company with plethora of different products introduced into the market. Similar trend was observed by Campbell and Rahman (2010) for Marks & Spencer but only in their latest analyzed period (2000-2009). What is interesting, within a decade Microsoft stressed the importance of corporate reputation (increase from rank 4 to rank 2), what is related with the observed increasing awareness of the firms to be socially responsible. However, in the case of Microsoft increase of reporting of the themes related to reputation derived from the rising number of litigations, mostly due to patent infringements and antitrust law claims. This explains also high rank of disclosing themes related to intellectual properties, what was not observed in the case of Marks & Spencer. However, similarly to Marks & Spencer, among the top five reported IC sub-categories there was a relatively often disclosed information on employees (number, salaries, stock-option plan and general perception), as part of human capital.

In order to gain insights into the quality of reporting, study in this paper included the assessment of the disclosed information (figure 2).

Figure 2. Narrative vs. factual information proportion (own study)

IC was predominantly reported in factual forms, with these making up to 90% (2013 and 2014). Lowest differences were found in the early studied years (1999-2003) with almost equal values found in 2000. This stays clearly in contrary with the results of Campbell and Rahman (2010), who stated almost ideally inverse disclosure (narrative IC disclosure outranked factual one in all studied years). In general, a slightly rising trend of factual information may be identified (strong one was observed during 2004-2014). However, after 2014 rapid decline in factual reporting was found in favor of narrative nature. It should be noted that narrative-driven nature is usually found in the front-end of annual report (letter to shareholders) which is written by the CEO of the

company. Thus, one of the possible explanation of that surprising (against the trend) phenomenon is the fact that in 2014 the CEO of Microsoft has changed, hence the way of addressing main goals and achievements of the company may have transformed just because of the personal shift. Research showed also different distribution of the form of IC sub-categories. Three structural capital sub-categories (corporate culture, management and technological process, information and networking system) and three human capital sub-categories (training, education and work related knowledge) were reported only in a narrative form throughout the entire studied period what means that these IC sub-categories are difficult to verify. Surprisingly, in terms of relational capital, none of its sub-categories was reported only in narrative form. In this sense, relational capital was much better disclosed in terms of reliability with the highest scores observed in terms of: brands, corporate reputation and customers. Substantial conclusion is that Microsoft IC reporting credibility has significant potential to be improved.

Important contribution of the study is also identification of two patterns in Microsoft longitudinal IC reporting. First, the core of information on IC being disclosed in annual reports throughout the studied period was relatively stable and similar. Following themes: corporate mission and vision, customer segmentation, distribution channels, brands recognition, litigations, stock option plans and R&D investments appeared in all documents, and their wording was almost the same. Second, in some annual reports there have been found IC themes appearing occasionally only in the given document. These were: executive officer incentive plan (2009), AAA rating (2009), joint ventures (2011), consumerization of IT (2012) and people orientation (2015). Disclosure of them may have derived either from: implemented actions (2009 – executive officer incentive plan in order to boost employee productivity, 2015 - joint ventures with Nokia and Yahoo,), favorable financial situation against the global financial crisis (2009- AAA rating) or trend recognition (2012 - consumerization of IT).

Conclusions

To the researcher's knowledge, this is the first study that analyzes the extent and quality of IC, IC categories and IC sub-categories reporting practices by Microsoft over long periods of time. Based on the adopted methodology, results suggest that IC disclosure is rising not only as total value, but also within each of IC categories, however the trend is relatively weak, due to large fluctuations (mostly relational capital). Study found that the most significant growth (despite variations) was observed in terms of relational capital, which appeared also to be the most frequent IC item reported, mostly due to: brands description, corporate reputation and proactive customer approach, including their identification importance in shaping the future strategy. Structural capital was identified as second most often disclosed IC category, mostly due to intellectual properties descriptions. Human capital information (least frequent reported) contained mostly data on total employment, remuneration and employee stock option plan. Besides, another contribution of the research is that IC disclosure was mostly found in factual (verified) way rather than in narrative (unverified).

Study provided valuable insight for regulators, practitioners and stock market analysts in terms of corporate reporting practices and through its practice-based evidence, for the future development of IC theory in general. Results have also implications for policy makers and standard setters for rethinking of inclusion of IC disclosure in annual reports as compulsory items. As a result, the quality of information would improve what

will enable various stakeholders to better value the firm. Subsequently, this will contribute to the relevance of the market efficiency hypothesis.

Clearly study has its limitations. A natural extension of this paper would be to explore IC disclosure on the larger sample over a longer period of time. Equally important would be to identify determinants of the extent and quality of disclosure of each IC sub-categories. Employment of other sources of data would provide additional value into the study as well.

Abstract. *Knowledge management research is increasingly dynamic and complex, reflecting the cross-disciplinarity of this field. Knowledge management, meaning knowledge creation, acquiring, deposit, analysis, transfer etc., is tightly related to data technologies, to digitalization of organizations, with digital technologies. The present research highlight the importance of technologic infrastructure in knowledge management, showing how previous studies considers this more a logistic issue. Relevant relationships such as the between knowledge management and big data, artificial intelligence, smart technologies, apps, as well as innovation are not so present in the existing literature. Digital infrastructure and technology provide the basis for connecting to artificial intelligence, as well as to natural human intelligence. The relationships with human decision-making processes have to be deeper investigated, as well as the impact on human and organizational behaviors.*

Keywords: *knowledge management; digitalization; digital transformation; big data; artificial intelligence.*

Introduction

Although knowledge management is a relatively young direction of research, due to its interdisciplinary implications and practical relevance for all types of organizations, the literature in the field increased exponentially. This is reflected in the growing number of conferences and publications dedicated to the field. Some of these journals are among the top rated by Clarivate Analytics (former Thomson Reuters – ISI), which reflect the importance and the complexity of this field.

Most of the studies associated with this domain are related to the economic environment – where, not by chance, the concept originates. To better understand the specific evolutions in the theory and practice of knowledge management we recommend the following publications: Kakabadse, Kakabadse and Kouzmin (2003), Anand and Singh (2011), Becerra-Fernandez and Sabherwal (2014), Bratianu (2015); Omotayo (2015), Cerchione, Esposito and Spadaro (2016), Massaro et al. (2016); Hislop, Bosua and Helms (2018).

Especially during the past decade, the attention of knowledge management researchers extended towards nonprofit organizations and public organizations (Garlatti et al., 2014; Massaro, Dumay & Garlatti, 2015; McEvoy, Ragab & Arisha, 2017). The research

on knowledge management in the context of public organizations goes in several directions: management style/leadership; organizational culture & intelligence; organizational development and innovation; technology; intellectual capital; knowledge sharing; stakeholder management (Pinzaru, Zbucea & Vitelar, 2018). As easily observed the relationships between knowledge management and technology (Butler et al., 2008; Cong & Pandya, 2003; Janowski, Pardo & Davies, 2012; Wiig, 2002) are very relevant to better understand this field.

The more recent research on knowledge management in nongovernmental organizations (Buheji et al., 2015; Hurley & Green, 2005; Rath, Given, & Forcier, 2016; Tatham, & Spens, 2011; Zbucea & Leon, 2015) shows that knowledge management helps an NGO to be more flexible, to relate better to the needs of stakeholders, to better satisfy the needs of their beneficiaries, etc.

Knowledge transfer, both inside the organization and outside, is key to successful management of all types of organizations. Transfers of knowledge between departments could lead to increased effectiveness across the organization. External knowledge could be integrated into internal processes for increased performance and better relationships with stakeholders and partners. Knowledge management is increasingly important for all sorts of organization because it positively influence the competitive advantage and business performance (Argote & Ingram, 2000; Zack, McKeen & Singh, 2009; Lee et al., 2016; Kianto, Hussinki, & Vanhala, 2018), but also because it is in line with the new vision on business – strategies as platforms rather than pipelines (Van Alstyne, Parker & Choudary, 2016).

Knowledge management, meaning knowledge creation, acquiring, deposit, analysis, transfer etc., is tightly related to data technologies, to the digitization of organizations, with digital technologies. The current research highlights the importance of technologic infrastructure in knowledge management but approaches it more like a logistics issue (Butler et al, 2008; Cong and Pandya, 2003; Janowski, Pardo and Davies, 2012; Wiig, 2002). Therefore, the present paper aims to understand better the relationships between Knowledge Management and Digital transformations.

Digital transformations and the impact on business management

All types of organizations are implementing the digital change. Again, the academic literature is more focused on business context, followed by the public one (for instance e-government or smart cities). Less attention is given to nongovernmental organizations, although they are eager to take advantages of the facilities offered by the digital era (Zbucea & Leon, 2015).

What is digitalization? Despite the continuous presence of the concept in a professional environment and the actual evolutions in the economy and society, one can observe that the academic research covers only partially this concept. The business environment is already embracing the digital transformation. For instance, an SAP study developed in 2015 already showed not only the profound transformation of businesses due to the digital economy, but also that 86% of the respondents considered the transformations beneficial for their organizations, and 70% said that digitalization presents more opportunities than threats (SAP, 2015).

Digital era imposed a digital economy – meaning that the tendency for most organizations is to use exclusively digital information in a hyperconnected system (Tapscott, 2015). This evolution influences all managerial processes, including knowledge management, as well as marketing strategies, customer relationship management, the way products/services are provided and sold, employment practices, as well as other business processes (see a brief review in Pinzaru, Zbucnea & Vidu, 2016). Among these transformations, the decision-making processes – starting with the collection of data and storing of knowledge, going through their analysis, to how and when the decision is released – are influenced (Kurti & Haftor, 2015; Loebbecke & Picot, 2015; McAfee & Brynjolfsson, 2012).

A very important consequence of digital transformations, with a strong impact on business practices, is the big data (Crişan, Zbucnea & Moraru, 2014; Günther et al., 2017; Loebbecke & Picot, 2015; McAfee & Brynjolfsson, 2012). Big data is an important asset for an organization but it also implies numerous challenges. Some of the questions associated with it are: What to collect? How to use it? Do we have the necessary competent employees? Big data encompasses large quantities of knowledge, but mining it is a complex process, which is not only related to the organization but also to the public – privacy and trust are the most evident. Therefore, the management of this knowledge is a complex endeavor.

Jed Cawthorne (2015) analysis how knowledge management strategies applied to data and big data contribute to the development of actionable insights (Figure 1). This process is mediated by tacit knowledge existing in the organization, by previous experience, and by formal processes coded in business intelligence. Both tacit and explicit knowledge are galvanized for better decision-making and producing added value.

Figure 1. Knowledge management and big data. Source: Cawthorne, 2015

Business models have changed in this context. The impact of digitalization is complex, blurring the lines between organizations. It facilitated a new form of economy: sharing

economy. This multifaceted form of business is intertwined with knowledge management (see various aspects in Vătămănescu & Pinzaru, 2017).

Knowledge management and digital technologies

When we think to the digital era, inevitably, words such as ITC, smart devices, the internet, IoT (Internet of Things), digital infrastructure pop-up in our minds. This is quite natural because the processes associated with the digital economy are not possible without all this new universe. Therefore, it is fully explainable that the academic literature on knowledge management highlights the importance of ITC infrastructure.

Several publications on knowledge management highlight the importance of technology for effective KM strategies (Butler et al, 2008; Cong & Pandya, 2003; Gold, Malhotra & Segars, 2001; Janowski, Pardo & Davies, 2012; Marwick, 2001; Wiig, 2002). Technology facilitates the obtaining, the storage, the transfer, as well as the analysis of knowledge. Adequate infrastructure involves also designing a knowledge architecture, and it is a precondition for effective knowledge management (Gold, Malhotra & Segars, 2001). Since the beginning of the discussion, the accent was put on explicit knowledge (Marwick, 2001).

Technology is not only a storage of knowledge. New technologies ensure dynamic and timely use of knowledge. We talk about complex platforms, multi-purposeful, wide knowledge management system infrastructures (Lee & Hong, 2002). We also stress that not only IT infrastructure but also other organizational factors stimulate knowledge creation (Chou, 2005).

Nevertheless, studies show that technology and an ITC infrastructure are not enough for effective knowledge management. One of the main factors to be considered is the organizational culture (Alavi, Kayworth, & Leidner, 2005; Park, Ribi re, & Schulte Jr, 2004; Zheng, Yang, & McLean, 2010). It influences all processes associated, including knowledge transfer and actual effective use. The communication culture within organizations is also relevant for the effective use of digital platforms for more effective knowledge management (Bratianu, 2015).

Another aspect to be considered is that both explicit and tacit knowledge are transmitted today via online apps. A simple example to consider: organizing and networking are increasingly digital – this would not be possible without various apps. These ensure dynamic capabilities which ensure new opportunities for organizations, both large and small. Cloud computing is another transformation which influences the way knowledge is managed. Both apps and cloud computing positively influence knowledge management (Sultan, 2013; Zbucnea & Leon, 2015).

The IT infrastructure and technologies associated with knowledge management practices might also influence innovation within organizations. More interaction, fast and personalized access to information and knowledge, as well as creative analyzing techniques, might lead to increased creativity and innovation (Carneiro, 2000; Du Plessis, 2007). On the other hand, literature also stresses risks related to formalism and decreased creativity related to strict procedures and control of knowledge sharing (Swan, 1999), as well as a two-sided relationship between knowledge management processes and innovation (Teixeira, Oliveira, & Curado, 2018). Nevertheless, the latest

development of IoT provides a stimulating environment for knowledge management, innovation, and co-creation (Santoro et al., 2017). We draw attention that, at least for now, humans are the most proficient agents in knowledge creation (Bolisani & Bratianu, 2018), but technology and artificial intelligence have given a boost to this process.

Artificial intelligence and knowledge management systems and strategies

Many managers consider that artificial intelligence is positively transforming their organizations, by enhancing business processes (Davenport & Ronanki, 2018). Three main areas are identified when considering the interferences of artificial intelligence with business: *automating business processes, gaining insight through data analysis, and engaging with customers and employees*. All these areas involve knowledge management.

Nevertheless, business representatives see the impact mostly on functional aspects: better products, less work-force etc. Only two aspects related to knowledge management are highlighted: make better decisions – 35% and capture and apply scarce knowledge where needed – 25% (Davenport & Ronanki, 2018). Knowledge management systems are at the base of dynamic learning processes, and artificial intelligence determines intelligent decision-making.

At the base of artificial intelligence in knowledge management would be the existence of knowledge warehouses (Nemati et al., 2002). They would provide a platform for intelligent analysis, which will enhance the knowledge spiral: tacit knowledge sharing across the organization, tacit to explicit knowledge conversion, explicit knowledge leveraging to new knowledge, and learning by conversion of explicit to tacit knowledge (Nemati et al., 2002).

Artificial intelligence could be used to better understand the competition and the environment, being part of the competitive intelligence system by developing learning platforms for businesses and organizations. A systematic review of the academic literature shows that together knowledge management and competitive intelligence lead to better decision making and competitive advantage (Shujahat et al., 2017). They have a positive impact on developing mission statements and long-term objectives, they contribute to evaluating both the internal and external environments, they help to better design and evaluate strategies.

Despite the general optimism, artificial intelligence has not proved to be so effective. The reasons are diverse, such as the difficulty to integrate it in business processes (Miller, 2018), high costs related to complex implementation and lack of expertise, etc. (Davenport & Ronanki, 2018). Another important aspect to mention is that technologies are immature, and people are indispensable for effective outcomes. One significant example in this context is the chatbot. Although chatbots are increasingly popular and they have improved continuously, their evaluation and use are still discussed (Radziwill & Benton, 2017).

Conclusions

Both theory and practice show that ITC infrastructure is very important for effective knowledge management. This supports not only knowledge storage and sharing, but especially the latest digital transformations and intelligent devices allow for co-

creativity and innovation, for more complex exploitation of knowledge for the benefit of an organization and its stakeholders.

The most considered connection between knowledge management and the digital transformations is related to the technological infrastructure used by knowledge management strategies. While ITC platforms are vital for managing explicit knowledge, they are not the only aspects to be considered. On one hand, we observe dynamic capabilities (such as apps) that continuously influence the knowledge management processes, including by better management of both tacit and explicit knowledge. On the other hand, human factors such as communication practices and organizational culture are key for maximum exploitation of these technological/digital platforms.

While the ITC platforms connected to knowledge management strategies are very important for effective implementation, more attention should be given to the digital environment – apps, IoT, chatbots, etc. – and mostly to the human factors. Digital infrastructure and technology provide the basis for connection to the artificial intelligence, as well as to natural human intelligence. The relationships with human decision-making processes should be deeper investigated, as well as the impact on human and organizational behaviors.

MARKETING AND CONSUMER BEHAVIOR

BRAND ASSOCIATIONS IN THE MIND OF THE CONSUMER

Abstract. *Branding is the science as well as the art of managing the associations of the consumer's mind with a brand and the public's memories of that brand. The brand is positioned at the intersection of the following key terms: differentiation, innovation, context, creativity, uniqueness and interest/attraction. We know that the success of the long-term relationship of the consumer with the brand is conditioned by the combination of brand associations in the mind of the consumer. We have approached the issue of identifying the specific brand associations to the Alexandru Ioan Cuza University. This method of building brand conceptual maps is an important tool in brand management decisions. It provides the opportunity to know how information is stored in the mind of the consumer as well as the system of relationships within the consumer's mind. The main purpose of this paper was to construct two conceptual maps of associations for the Alexandru Ioan Cuza University brand for consumers and non-consumers of the brand by synthesizing the maps of individual associations made by each respondent as well as highlighting the main differences between the two conceptual associations maps made. The aim of the paper was to identify two sets of associations created by the Alexandru Ioan Cuza University brand in the minds of the consumers and non-consumers and to identify the intensity of the general feeling expressed towards the brand by the two categories.*

Keywords: *brand associations; brand conceptual map; brand equity; brand image; brand knowledge.*

Introduction

The issue of defining the concept of brand is becoming more and more current and increasingly studied (Datculescu, 2006, pp.58-76). Despite its importance (Myers, 2003), few methods of identifying and compiling brand maps have been developed so far (Punj & Moon, 2002), research methods developed focusing only on identifying brand associations in the mind of the consumer but not aggregating them into a network (Henderson, Iacobucci & Calder, 2002). It would be useful to remember here two methods of interest in developing brand maps such as ZMET (Zaltman's Metaphor Elicitation Technique), a method that uses qualitative techniques to identify the main

brand associations in the mind of the consumer, then through in-depth interviews discoveries of the links between these associations (Christensen & Olson, 2002). The second method - the construction of analytical maps, implies first to discover the brand associations in the mind of the consumers, and secondly, analytical methods and algorithms reveal the links between these associations (Henderson, Iacobucci & Calder, 1998). In this context, the identification and determination of the network of associations that intervene in the mind of the consumer (Campbell, 2002, pp.208-218) as a result of the branding strategy is the main pillar in consolidating and crystallizing the image, as well as in creating a business identity like a business card (Keller, 1998, pp.56-59).

The identification and measurement of these associations is the main concern of brand managers (Cărmădă, 2009, pp.39-41). Existing methods are more accessible to sociology and psychology practitioners rather than to marketers, as these associations are conditioned by cognitive processes in the minds of consumers (Brandt & Pahud de Mortanges, 2011). One of these methods, which has been simplified to make it accessible to marketing specialists, is building brand conceptual maps using the set of brand associations in the mind of the consumer (Joiner, 1998, pp.311-317). These maps are the visual representation of the associated consumer words with the brand, but also the way they are interconnected (Roedder et al., 2006).

We have approached the issue of identifying the specific brand associations to the Alexandru Ioan Cuza University. This method of building brand conceptual maps is an important tool in brand management decisions. It provides the opportunity to know how information is stored in the mind of the consumer as well as the system of relationships within the consumer's mind (Schnittka, Sattler & Zanker, 2012). The method of building brand conceptual maps incorporates two other methods, simplifying them so that they can be applied on larger samples and without the need for specialized training of interviewers. Being relatively new, this method is not yet widely used on the Romanian market, from where comes the challenge of its approach in this paper.

Literature Review

Nowadays, the brand becomes the most important component of the company's assets, as the top assets become intangible, namely the company name, the logos, the customer base or the patents. A survey conducted in 2000 shows that for the top twenty companies in the world, only 20% of their resources were tangible, the rest being intangible, including brands (Danciu, 2004, pp.17-19).

Creating a brand involves communicating a brand image in such a way that the target group of the brand will form a set of associations related to that brand. Thus, the brand equity concept has become an increasingly updated and important topic in marketing management. Despite the increased interest in this topic, little research has been carried out to investigate both the nature of brand associations and their effect on consumer behavior.

Among the few studies carried out, a large part of them deal with this subject from a theoretical perspective, without carrying out either quantitative or qualitative research (Keller, 1993, 1998). Keller (1993) presents a conceptual model of brand equity from the perspective of the individual consumer. As for brand associations, he synthesizes

more research results, including the psychological field, conceptualizing various dimensions of associations. Associations are presented as a component part of the brand image that along with awareness of brand existence will constitute the brand awareness degree. Keller also offers a broad classification of types of associations, deals with their dimensions, but also provides implications for their measurement.

Joiner (1998), applying methods used in psychology and education to determine the cognitive structure, but also on the basis of previous research in the field of mind functioning, proposed a conceptualization model of brand associations called the Concept Map. Within this method, associations are seen as nodes that are linked by paths or relationships. Respondents who participated in the research were asked to write the associations they have in mind on a sheet (related to a particular subject/brand) and to relate them to each other by means of lines that represent the relations between them.

Low and Lamb (2000) deal in a different way conceptualizing brand associations, referring to three dimensions: brand image, brand attitude, and perceived quality.

Another study, which this time only deals with the brand image, was developed by the Spanish authors Belen del Rio, Vazquez and Iglesias (2001). Their research explores brand associations based on the functions or benefits that consumers associate with the brand. In particular, these functions are measured by four dimensions: warranty, social identification, status and personal identification. The article also studies the influence of these four dimensions on the consumers' desire to pay a premium price, to recommend the brand or to buy other related products from the same brand.

As a follow-up to the model built by Joiner, the authors Roedder, Loken, Kyeongheui, and Monga present the model of building conceptual brand maps. According to them, the developed methodology is a way of identifying brand association networks. Unlike Joiner's method, this model involves selecting and building a conceptual brand map based on the associations made available, while also mentioning the intensity of links between associations.

Brand maps or graphic representations of associations are important from the perspective of understanding the links and relationships between brand associations. Brandt and Pahud de Mortanges (2011) use the same research methodology as the one presented above, but this time it's about a product, not a service like the original model. Brandt and Pahud de Mortanges which also target the model of building conceptual brand maps. The research once again validates the model, confirms improvements to the methodology, and extends the scope to city brands.

The main concern of brand managers is to understand and manage the set of associations generated by a particular brand. Thus, the authors Till, Baack and Waterman (2011) have attempted to develop a methodology for identifying these associations that is also accessible to brand managers in terms of ease of application. As a result of applying the proposed method, managers gain a clear and complex vision on the associations generated by the managed brand or the competitors' brand, being able to visualize them in a strategic brand association map.
