

Proceedings of the  
**Technical Workshop on Reinforcement and  
Drainage in Soil Structures**

Barcelona, 25-27 June 2024

Technical Committees on:

**Soil Reinforcement** (TC-R, *International Geosynthetic Society*),  
**Hydraulic Applications** (TC-H, *International Geosynthetic Society*), and  
**Reinforced Fill Structures** (TC-218, *International Society for Soil Mechanics  
and Geotechnical Engineering*)

## Technical Workshop on Reinforcement and Drainage in Soil Structures

Barcelona, 25-27 June 2024

Venue:

Universitat Politècnica de Catalunya·BarcelonaTech (UPC)  
Department of Civil and Environmental Engineering (DECA), School of Civil Engineering,  
UPC Campus Nord, c/ Jordi Girona 1-3, 08034, Barcelona, Spain

## Table of Contents

<b>Preface: Notes from the Editors</b>	p.3
<b>Session 1a: Geosynthetic materials and soil interaction 1. Chair: Oliver Detert</b>	
<b>Protection of reinforced soil structures using geosynthetic cementitious composite mats.</b> <i>Lee K. Church and Flavio Cosma (speaker)</i>	p.5
<b>The novel geocell anchor cage system.</b> <i>Gali Madhavi Latha</i>	p.9
<b>Investigating soil-geogrid interaction: insights from long-term pullout tests.</b> <i>Marilene Pisano</i>	p.13
<b>Analysis of physical PET strap reinforcement pullout tests data.</b> <i>Aníbal Moncada (speaker), Núria Girbau, and Ivan P. Damians</i>	p.17
<b>Session 1b: Geosynthetic materials and soil interaction 2. Chair: Yoshihisa Miyata</b>	
<b>Long-term performance of PET geogrids with LLDPE coating in alkaline conditions: exhumation findings post lime and cement stabilization.</b> <i>Giulia Lugli (speaker) and Moreno Scottò</i>	p.21
<b>Degradation behavior of stressed polyester reinforcing products under alkaline conditions embedded in eluates and soils.</b> <i>Oliver Detert</i>	p.25
<b>A new look at the use of coated PET geogrid reinforcement in highly alkaline environments.</b> <i>Samuel R. Allen</i>	p.27
<b>Session 2a: Numerical modelling approaches 1. Chair: Yewei Zheng</b>	
<b>Numerical modelling of geosynthetic reinforcements – simple constitutive models allowing for durability.</b> <i>Margarida Pinho-Lopes (speaker) and António M. Paula</i>	p.31
<b>Insight to the numerical modelling of geosynthetic reinforced soil walls subjected to varying atmospheric conditions.</b> <i>Aníbal Moncada (speaker), Ivan P. Damians, Sebastià Olivella, and Richard J. Bathurst</i>	p.35
<b>Session 2b: Numerical modelling approaches 2. Chair: Pietro Rimoldi</b>	
<b>Numerical investigation on the interaction effect of back-to-back MSE walls with different facing conditions.</b> <i>Fuxiu Li, Richard J. Bathurst, and Yewei Zheng (speaker)</i>	p.39
<b>Numerical modelling of geosynthetic reinforced fills over voids.</b> <i>Richard J. Bathurst (speaker) and Fahimeh M. Naftchali</i>	p.43
<b>Session 3a: Design guidelines and methods 1. Chair: Daniele Cazzufi</b>	
<b>MSE walls design in seismic regions.</b> <i>Oltion Korini</i>	p.47
<b>Developments in reliability-based design for reinforced soil structures.</b> <i>Richard J. Bathurst</i>	p.51
<b>Reliability analysis of PET strap pullout models.</b> <i>Yoshihisa Miyata</i>	p.55

<b>The new Eurocode EN 1997-3: Clause 9.</b> <i>Ivan P. Damians and Pietro Rimoldi (speakers)</i>	<i>p.57</i>
<b>Design methods for drainage of reinforced fill structures.</b> <i>Pietro Rimoldi</i>	<i>p.61</i>
<b>Reinforced soil design and construction with polymer strap reinforcement.</b> <i>Colin J.F.P. Jones</i>	<i>p.65</i>
<b>Session 4a: Case histories 1: General. Chair: Giulia Lugli</b>	
<b>Geotextile reinforced sludge pond closure.</b> <i>Kwan S. Tong</i>	<i>p.69</i>
<b>Optical fiber monitoring of a reinforced fill structure built with stabilized ground.</b> <i>Maximilien Van Breusegem (speaker), Nicolas Denies, and Nicolas Freitag</i>	<i>p.73</i>
<b>Challenges in the design, supply and installation of geocomposite drainage solutions as an alternative to traditional drainage systems of MSE structures.</b> <i>Antonio Ramirez (speaker), Ignacio Hirthe, and Pascal Saunier</i>	<i>p.77</i>
<b>Session 4b: Case histories 2: Bridge Abutments. Chair: Shahriar Mirmirani</b>	
<b>First permanent geosynthetic reinforced bridge abutments for motorway spanning in Germany.</b> <i>Hartmut Hangen</i>	<i>p.81</i>
<b>Load-carrying geosynthetic-reinforced bridge abutments.</b> <i>Jorge G. Zornberg (speaker) and Amr M. Morsy</i>	<i>p.85</i>
<b>GRS-IBS system with double-twist steel-mesh and geogrids combination in Oosterweel Verbinding (Antwerp, Belgium).</b> <i>Francesco Masola (speaker), Paolo Gualandi, and Steven De Maesschalck</i>	<i>p.89</i>
<b>Session 5a: Climate impact and Sustainability aspects 1. Chair: Anaïs Grandclerc</b>	
<b>Recycled construction and demolition aggregates as alternative fill materials for geosynthetic-reinforced systems.</b> <i>Fernanda Ferreira (speaker), Pedro V. Pereira, Pedro B. Ribeiro, Castorina S. Vieira, Patricia C. Lopes, and Maria L. Lopes</i>	<i>p.93</i>
<b>Wall and slope reinforcement via drainage - some practical examples and benefits.</b> <i>David Shercliff</i>	<i>p.97</i>
<b>Life cycle assessment and design methodology of sustainable GRS structures using marginal fill and high performances draining geogrids.</b> <i>Fabrizia Trovato (speaker) and Puthiya V. Jayakrishnan</i>	<i>p.101</i>
<b>Use of marginal and recycled fills for GRS structures.</b> <i>Stanislav Lenart (speaker) and Siva R.Karumanchi</i>	<i>p.105</i>
<b>Session 5b: Climate impact and Sustainability aspects 2. Chair: David Shercliff</b>	
<b>What's behind an EPD? Presentation of two EPD examples.</b> <i>Anaïs Grandclerc (speaker) and Thomas Joussellin</i>	<i>p.109</i>
<b>Sustainability benefits of geosynthetics in erosion control, drainage and soil reinforcement applications.</b> <i>Puthiya V. Jayakrishnan (speaker) and Giulia Lugli</i>	<i>p.113</i>
<b>Relevant aspects to consider on life cycle assessment of geosynthetic reinforced soil wall.</b> <i>Anibal Moncada (speaker), Khashayar Malekmohammadi, Ivan P. Damians and Richard J. Bathurst</i>	<i>p.117</i>

## Preface: Notes from the Editors

The present volume contains the contributions to the “Technical Workshop on Reinforcements and Drainage in Soil Structures” which took place in Barcelona (Spain), from June 25<sup>th</sup> to 27<sup>th</sup>, 2024.

The event was organized by the joint collaboration of the Soil Reinforcement (TC-R) and Hydraulic Applications (TC-H) technical committees of the International Geosynthetic Society (IGS), and the Reinforced Fill Structures (TC-218) of the International Society for Soil Mechanics and Geotechnical Engineering (ISSMGE).

The workshop attracted professionals from all over the world, proving to be an attractive and productive endeavor in which ideas, concepts, and products were shared, discussed, and improved upon. Participants traveled from all over Asia (Australia, China, India, Japan, Malaysia, New Zealand, United Arab Emirates), Americas (Canada, USA, Chile), and Europe (Austria, Belgium, France, Germany, Greece, Hungary, Italy, Netherlands, Portugal, Slovenia, Spain, Turkey, and UK).

Attendees and collaborators include 41 industry related participants (i.e., consultants, manufactures, and/or engineers) and 22 academy related participants, from which 3 were post-graduate students. From this, 30 collaborations were received, with a total of 48 authors and 27 different speakers. Collaborations were categorized in five distinct sections according to the following topics:

- Geosynthetic materials and soil interaction
- Numerical modelling approaches
- Design guidelines and methods
- Case histories
- Climate impact and sustainability aspects

The following table details the scientific impact of the event by analyzing the average  $H_i$ -value (H-index: numerical scale that neutrally represents how effective a researcher has been) from the authors and presenting authors (speakers):

Category	#	H-index (total)	H-index (last 5 years)	Description
Speakers	27	<b>16.67</b>	<b>10.33</b>	Average H-index by speaker *
Authors	48	<b>9.38</b>	<b>5.81</b>	Average H-index by author *

\*  $H_i$ -values obtained from Google Scholar (<https://scholar.google.com/>); search conducted in July 2024.

Finally, the organizing committees TC-R, TC-H and TC-218, Editors, and the International Geosynthetic Society would like to thank also the collaboration of the following Sponsors:

**Key words:** Recycled C&D materials, Geosynthetics, Interface shear behaviour, Mechanical damage, Cyclic loading, Sustainability

**Abstract.** *The reuse and recycling of construction and demolition (C&D) waste materials have become essential as the construction sector strives to reduce its carbon footprint and contribute towards environmental preservation. In addition, the benefits of incorporating geosynthetics in geo-infrastructure design have driven significant research efforts to evaluate their behaviour when combined with unconventional fill materials. In this context, a comprehensive research study has been conducted at the University of Porto to explore the potential use of recycled C&D aggregates as alternative fill materials in the construction of geosynthetic-reinforced transport infrastructure systems. Extensive laboratory tests were initially performed to evaluate the geotechnical and geoenvironmental properties of various recycled C&D materials and to assess the feasibility of their use in transport infrastructure applications, such as embankments and capping layers. Large-scale direct shear tests were then conducted to analyse the interface shear response between recycled C&D aggregates and geosynthetics under both static and cyclic normal loading. The geosynthetic mechanical damage induced by a standard aggregate and recycled C&D materials under repeated loading was also investigated. This paper outlines the aforementioned research and some relevant outcomes, with the overall aim of promoting the adoption of ecological practices in infrastructure design and construction, in line with the 2030 Agenda for Sustainable Development.*

### 1 INTRODUCTION

The 2030 Agenda for Sustainable Development emphasises the need for collaborative efforts to create a sustainable and resilient future for both people and the planet. Given that the civil/geotechnical engineering practice often involves the extensive use of natural and manufactured raw materials, there has been a substantial focus on introducing new, environmentally friendly materials and recycling waste products with the purpose of mitigating the environmental impacts generated. In particular, the adoption of eco-efficient strategies in the design and construction of transport infrastructures, such as the incorporation

of recycled fill materials and geosynthetics can make a decisive contribution towards reducing the carbon footprint of such infrastructure projects and achieving more sustainable development (Yoo, 2023; Ferreira et al., 2023).

This paper discusses the suitability of recycled C&D wastes as a replacement for conventional fill materials in geosynthetic-reinforced systems. The properties of various recycled C&D aggregates are compared with the criteria defined in Portuguese specifications. The direct shear response of the interfaces between recycled C&D aggregates and two geosynthetics subjected to static and cyclic normal loading is assessed based on the results of large-scale direct shear tests. Additionally, the geosynthetic mechanical damage caused by different aggregates under repeated loading is evaluated by comparing the in-isolation tensile load-strain behaviour of intact and damaged geosynthetic specimens.

## 2 CHARACTERISATION OF RECYCLED C&D AGGREGATES

A series of laboratory tests was carried out following the applicable European standards to assess the geotechnical and geoenvironmental properties of four recycled materials, including two recycled concrete aggregates (C&DW\_C1 and C&DW\_C2) resulting from the demolition of concrete poles, and two recycled mixed aggregates (C&DW\_M1 and C&DW\_M2) from the demolition of buildings and other civil infrastructures (Fig. 1). The feasibility of using C&DW\_C2 as an alternative aggregate in the construction of rural and forest roads was discussed elsewhere (Pereira et al., 2020). The laboratory study involved the evaluation of constituents, gradation, compaction parameters, flakiness and shape indexes, assessment of fines through the methylene blue and sand equivalent tests, Los Angeles coefficient, as well as laboratory leaching tests to determine the potential release of contaminants. The results were then compared with the technical requirements established in the Portuguese specification LNEC E474 (2009), which provides guidelines for the inclusion of recycled C&D materials in embankment and capping layer of transport infrastructures. It was found that the C&DW\_M1 and C&DW\_C2 can be considered as suitable alternative fill materials for embankment body and capping layer of transport infrastructures. Conversely, the C&DW\_M2 and C&DW\_C1 did not comply with the requirements for capping layer. In fact, the associated Los Angeles coefficients exceeded the threshold value, thus reflecting their relatively high susceptibility to breakage. However, these aggregates fulfilled the criteria to be used as embankment fills. The laboratory leaching tests revealed that the studied aggregates can be classified as inert materials, thereby not representing any concerns in terms of groundwater contamination.

### 3 DIRECT SHEAR BEHAVIOUR OF RECYCLED C&D AGGREGATES-GEOSYNTHETIC INTERFACES UNDER CYCLIC NORMAL LOADS

The interface shear response between the aggregate C&DW\_M1 and two geosynthetics was evaluated by large-scale direct shear tests carried out under both static and cyclic normal loading (Fig. 2a). A biaxial geogrid (GGR) manufactured from polypropylene (PP) textured flat bars with welded junctions and square apertures, and a laid geocomposite reinforcement (GCR) comprising a geogrid and a mechanically bonded PP geotextile welded within the geogrid structure were employed in this study. The direct shear tests under static loading were conducted under normal stresses ranging from 25-75 kPa, whereas the cyclic tests were performed by applying sinusoidal waves with varying amplitudes ( $\Delta = \pm 12.5$  and  $\pm 25$  kPa) and frequencies ( $f = 0.2$  and  $1$  Hz), under initial normal stress of 50 kPa. Test results have shown that the interface shear behaviour and associated strength parameters are comparable to those generally observed for interfaces involving similar geosynthetics and conventional fill materials. The cyclic normal loads induced a reduction in the peak interface shear strength, particularly under higher amplitude or lower frequency values (Fig. 2b).

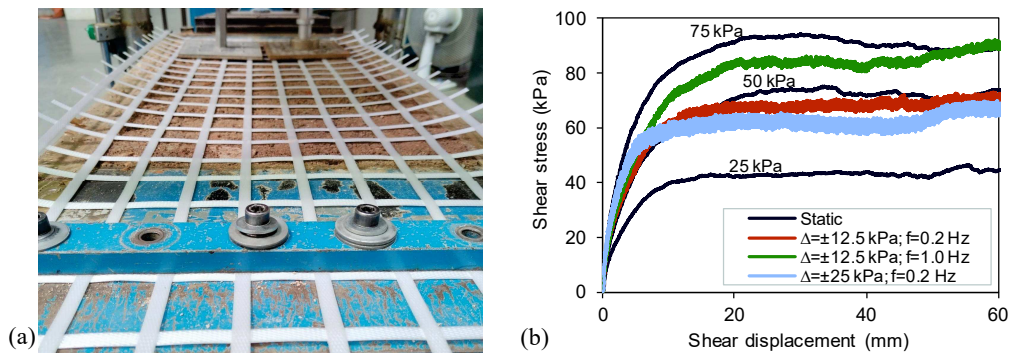

Figure 2: Large-scale direct shear tests: (a) lower shear box; (b) selected results (GGR - C&DW\_M1 interface).

### 4 GEOSYNTHETIC MECHANICAL DAMAGE CAUSED BY RECYCLED C&D AGGREGATES

The mechanical damage to geosynthetics (GGR and GCR) caused by granular materials under repeated loading was simulated in the laboratory using two distinct aggregates: a synthetic standard aggregate, SSA (i.e. corundum) and the recycled aggregate C&DW\_M1 (Fig. 3a). These tests aimed to replicate the degradation that geosynthetics may experience during field installation (ISO 10722). The potential geosynthetic damage was then quantified based on the induced changes in the short-term tensile load-strain behaviour (Fig. 3b).

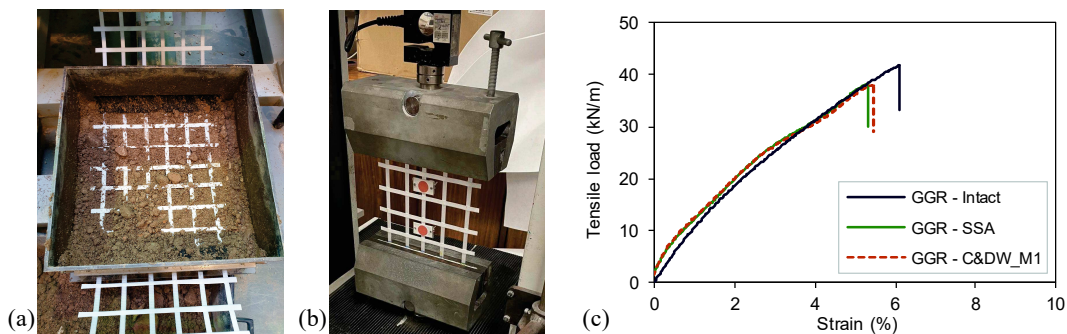

Figure 3: Mechanical damage under repeated loads: (a) damage simulation; (b) tensile tests; (c) GGR results.

The average load-strain curves presented in Fig. 3(c) indicate that the maximum tensile strength of the GGR reduced by up to 10% upon the damage simulation process. However, the secant stiffness at very low strains was found to slightly increase. No significant differences were observed between the degradation caused by the distinct aggregates.

## 5 CONCLUSIONS

The potential use of recycled C&D aggregates in the construction of geosynthetic-reinforced systems was investigated in this study by a series of laboratory tests. The characterisation of four recycled C&D materials revealed that these aggregates may be used as alternative fill materials in transport infrastructure applications. The interface behaviour between a mixed recycled C&D aggregate and two geosynthetics subjected to static and cyclic normal loading was evaluated through large-scale direct shear tests. It was found that the load frequency is positively correlated with the interface peak shear strength, whereas the load amplitude produces the opposite effect. The degradation of geosynthetic short-term tensile strength induced by recycled C&D waste under repeated loading did not exceed 10%. Overall, the results showed that using recycled C&D aggregates combined with geosynthetics may be considered as a promising approach to meet global sustainability requirements.
