1. Metodologias do QS-WUR e QS-WUR by Subject e participação da U.Porto

1.1 Metodologia QS-WUR

"The QS World University Rankings® are designed to help prospective students make informed comparisons of leading universities around the world. Based on six performance indicators, the ranking assesses university performance across four areas: research, teaching, employability and internationalization.

Each of the six indicators carries a different weighting when calculating the overall scores (see below). Four of the indicators are based on 'hard' data, and the remaining two are based on major global surveys – one of academics and another of employers – each the largest of their kind.

[...]

Academic reputation (40%)

Academic reputation is measured using a global survey, in which academics are asked to identify the institutions where they believe the best work is currently taking place within their own field of expertise. The aim is to give prospective students a sense of the consensus of opinion within the international academic community. For the 2016/17 edition, a total of 74,651 academics contributed. Regional weightings are applied to counter any discrepancies in response rates.

Employer reputation (10%)

The employer reputation indicator is also based on a global survey, this time asking employers to identify the universities they perceive to be producing the best graduates. This indicator is unique among international university rankings. Its purpose is to give students a better sense of how universities are viewed in the graduate jobs market. A higher weighting is given to votes for universities that come from employers based in other countries, so this indicator is especially useful for prospective students seeking to identify institutions with a reputation that extends beyond their national borders. The 2016/17 edition draws on responses from 37,781 graduate employers.

Student-to-faculty ratio (20%)

This is a simple measure of the number of academic staff employed relative to the number of students enrolled. In the absence of an international standard by which to measure teaching quality, this indicator aims to identify the universities that are best equipped to provide small class sizes and a good level of individual supervision.

Citations per faculty (20%)

This indicator aims to assess universities' research impact. A 'citation' means a piece of research being cited (referred to) within another piece of research. Generally, the more often a piece of research is cited, the more influential it is. So the more highly cited research papers a university publishes, the stronger its research output is considered.

QS collects this information using Scopus, the world's largest database of research abstracts and citations. The latest five complete years of data are used, and the total citation count is assessed in relation to the number of academic faculty members at the university, so that larger institutions do not have an unfair advantage. For the 2016/17 rankings, QS analyzed 10.3 million research papers and 66.3 million citations.

For the 2015/16 edition of the QS World University Rankings, several refinements have been introduced to the way this indicator is assessed, with the aim of providing a more balanced reflection of research impact across different faculty areas. You can find out more about these refinements [here](#).

International faculty ratio (5%) & international student ratio (5%)

The last two indicators aim to assess how successful a university has been in attracting students and academics from other nations. This is based on the proportion of international students and faculty members at the institution. Each of these indicators contributes 5% to the overall ranking results.

Since the QS World University Rankings were first developed in 2004, they have expanded to rank more than 900 universities in 2016/17, with over 3,800 assessed. The top 400 universities are given individual ranking positions, and the rest are ranked in groups – starting from 401-410, up to 701+. The results are published in an interactive ranking table, which can be sorted by country/region and by each of the six performance indicators listed above.”¹

1.2 Metodologia QS-WUR by Subject

“The QS World University Rankings by Subject ranks the world’s top universities in individual subject areas, covering 46 subjects as of 2016. The rankings aim to help prospective students identify the world’s leading schools in their chosen field, with the list of subjects extended each year in response to high demand for subject-level comparisons.

Each of the subject rankings is compiled using four sources. The first two of these are QS’s global surveys of academics and employers, which are used to assess institutions’ international reputation in each subject. The second two indicators assess research impact, based on research citations per paper and h-index in the relevant subject. These are sourced from Elsevier’s Scopus database, the world’s most comprehensive research citations database.

These four components are combined to produce the results for each of the subject rankings, with weightings adapted for each discipline.

1. Academic reputation

QS’s global survey of academics has been at the heart of the QS World University Rankings® since their inception in 2004. In 2017, the QS World University Rankings by Subject draws on responses from 74,651 academics worldwide.

Having provided their name, contact details, job title and the institution where they are based, respondents identify the countries, regions and faculty areas they have most familiarity with, and up to two narrower subject disciplines in which they have expertise. For each of the (up to five) faculty areas they identify, respondents are asked to list up to 10 domestic and 30 international institutions which they consider excellent for research in the given area. They are not able to select their own institution.

For the QS World University Rankings by Subject, the results of the survey are filtered according to the narrow area of expertise identified by respondents. While academics can select up to two narrow areas of expertise, greater emphasis is placed on respondents who have identified only one.

2. Employer reputation

The QS World University Rankings are unique in incorporating employability as a key factor in the evaluation of international universities. In 2017, the QS World University Rankings by Subject draws on 40,643 survey responses from graduate employers worldwide.

The employer reputation survey works on a similar basis to the academic one, but without the channelling for different faculty areas. Employers are asked to identify up to 10 domestic and 30 international institutions they consider excellent for the recruitment of graduates. They are also asked to identify the disciplines from which they prefer to recruit. By examining the intersection of these two questions, we can infer a measure of excellence in a given discipline.

3. Research citations per paper

For the QS World University Rankings by Subject we measure citations per paper, rather than citations per faculty member. This is due to the impracticality of reliably gathering faculty numbers broken down by discipline for each institution.

A minimum publication threshold is set for each subject to avoid potential anomalies stemming from small numbers of highly cited papers. Both the minimum publications threshold and the weighting applied to the citations indicator are adapted in order to best reflect prevalent publication and citation patterns in a given discipline. All citations data is sourced from the Scopus, spanning a five-year period.

¹ Retirado de <http://www.topuniversities.com/qs-world-university-rankings/methodology> Acedido 6 setembro de 2016.

4. H-index

Since 2013, a score based on 'h-index' has also been incorporated in the QS World University Rankings by Subject. The h-index is a way of measuring both the productivity and impact of the published work of a scientist or scholar. The index is based on the set of the scientist's most cited papers and the number of citations that s/he has received in other publications.

The h-index can also be applied to the productivity and impact of a group of scientists, such as a department or university or country, as well as a scholarly journal. The index was suggested by Jorge E. Hirsch, a physicist at UCSD, as a tool for determining theoretical physicists' relative quality, and is sometimes called the Hirsch index or Hirsch number.

How are large research collaborations assessed?

In 2016, QS introduced an improvement to the way research papers with authors from an exceptionally large number of institutions are assessed. Situations such as these occur most frequently in scientific subjects such as high-energy physics, cosmology, or genomics, where large-scale international collaborations are common.

If each institution involved in papers such as these receives full credit for the citations, even very important and worthwhile papers can end up having a disproportionately large impact on the ranking results. Yet it is equally undesirable to give each institution a share of the credit, as this could discourage research collaborations among groups of any size.

With the support of the QS Global Academic Advisory Board, the solution adopted was to omit any paper with more than 99.9% of the average number of institutional affiliations for the subject in question. This replaces the previous approach of omitting all papers with more than 10 institutional affiliations, which unfairly penalised certain scientific fields, such as medicine.

Weightings

As research cultures and publication rates vary significantly across academic disciplines, the QS World University Rankings by Subject applies a different weighting of the above indicators in each subject. For example, in medicine, where publication rates are very high, research citations and the h-index account for 25% of each university's total score. On the other hand, in areas with much lower publication rates such as history, these research-related indicators only account for 15% of the total ranking score. Meanwhile in subjects such as art and design, where there are too few papers published to be statistically significant, the ranking is based solely on the employer and academic surveys.²

"NEW FOR 2017: This year, we are releasing 4 new subjects for the QS World University Rankings by Subject: Anatomy & Physiology, Hospitality & Leisure Management, Sports-related Subjects and Theology, Divinity & Religious Studies.

Also, much like last year's QS World University Rankings, we have applied an affiliation cap, discarding any paper with more than a given number of affiliations. However, in response to robust feedback on a flat cap of 10, we have here applied a variable cap at the first whole number above 99.9% of all research in the given field, reducing the proportion of excluded papers from 0.34% last September, to less than 0.1% going forward.³

Desde 2009, a Universidade do Porto disponibiliza ao QS a lista de empregadores e os dados relativos a estudantes, docentes / investigadores e propinas. Desde 2011, disponibiliza as listas de académicos e variantes de nome da Universidade no Scopus.

Para esta edição, os dados de estudantes (2014/2015) e académicos (2015) foram solicitados em março de 2016, reportados e validados pelo QS em abril.

As listas de académicos, empregadores e variantes de nome no Scopus foram pedidas no início de dezembro de 2015 e enviadas no fim de janeiro de 2016.
